THE BUILDING NEWS

AND ENGINEERING JOURNAL.

AN ART EXHIBITION AT VENICE.

THE announcement of such an exhibition, for next month, in Venice, seems paradoxical, because Venice is all one work of art, one picture of glowing perspectives and magnificent interiors, matchless, whether in Europe or the East. Yet it has been resolved upon by the City of Painters to make a display of its canvas treasures such as shall dim the newly-asserted supremacy of Rome; "for Venice," says the patriot of her local press, "though now only a town in a province, will always sway the sovereign sceptre of the arts." It is a haughty thing to say; but the truth of the challenge is unquestionable. Florence, Rome, and Milan arrived at their full development, it is true, somewhat before the Capital of the Canals; but it speedily outstripped them with its Renaissance genius at the hands of Tintoretto, Titian, and Veronese. And now it proclaims a display, not of an emulative character, with its splendid idealisations of fashions, fancy, manners, and civil splendour. "Venice," the invitation runs, "with her street pavements of liquid chrysope, her palaces of porphyry and marble; her quays and squares aglow with the brilliant costumes of the Levant; her lagoons, crowded with the galleys of all nations; her churches, floored with mosaics; her silvery domes, and ceilings glittering with sculptures, bathed in molten gold!" A little less effusion might have suggested the real importance of the exhibition about to be opened, since, it may still be repeated, the Queen and Crown of the Adriatic would be an adornment and a glory of the world in herself, were not a single picture framed upon her walls;—with her luxuriance of light and colour; her arches of sky, bounded nowhere except by horizons of low, quivering sea and purple monotones of plain; her islets of coral and pearl; and her rich secrets of colour, into which the minds of Van Eyck and Fra Angelico quickly and deeply penetrated. But what were they in comparison with the palettes prepared every Venetian morning and every Venetian evening for the student—the crimsons, and scarlets, and blues of the iris, the anemone, of the columbine, brightening broad masses of green grass, making it brilliant, as some rapture-loving writer has said, with a "melodrama of green and gold." Yet it is not in all this that we find, or are inclined

to seek, the real inspiration of the great Venetian painters. They were surrounded by monotony; they enjoyed daily splendours, yet these were always the same; but still in Venetian landscape we discover the true secret of Venetian art. Not alone, however, as the forthcoming exhibition, warmed as it will be by the autumn light, will demonstrate. To begin with, if we may follow the opinion of Pietro Aretino, the buildings of Venice, though constructed of solid stone, appear to be constructed of some ethereal substance. Far different were they from the works of the vulgar Medicean dynasty, who had perpetually war at their gates, with slavery for their invariable end; and whose grim grey palaces and austere churches bore on their fronts the stamp of the Middle Ages. It has been remarked, indeed, as a not insignificant, although a slight, detail, to which we can bear personal witness, that the predominant colour of Florence is a cold and sombre brown; while, on the other hand, the predominant colour of Venice is that of mother-of-pearl, which conceals within its general whiteness every tint that can be placed upon the palette of a painter. Venice first made, of herself, a picture, and next a picture gallery. The Ducal Palace, so called, was her first triumphant work in the sight of Europe. Centuries have contributed to make that edifice what it is. The massive colonnades and Gothic loggias on which it rests, date from the 13th century; their sculptures date from the age when Nicolo Pisano's genius was still in the ascendant; and this structure, which is to contain the exhibition, will, possibly, possess a deeper interest than the entirety of its contents. The square fabric of the palace, so marvellous in the irregularity of its pointed windows, so various in its mosaic diaper of pink and white, is attractive enough; but the inner court, which throws its bridge over the lateral, illustrates the handiwork of Sansovino, a Florentine of the Renaissance, who adopted Venice as his home, and whose genius, stimulated by the magnificence of the Republic, created a style of architecture almost arrogant in its fusion of a broad and vast design with a superfluity of minute decoration. Never before had arisen such a pride—such an insolence it might almost be said—of civic display. The halls of the palace—spacious chambers wherein the Senate assembled,

where ambassadors approached the Doge, where the Council of the Ten conducted their inquisition—are walled and roofed in frameworks of sculptured oak, overlaid with solid gold, specimens of which, or illustrations of them, are to be seen in profusion at Vienna.

It would seem, moreover, that these solid, local, and hereditary splendours of the Republican palace are to constitute the principal glories of its display; thus, the gold brocade of the historical ducal uniform, the scarlet and crimson of the Venetian noble, harmonised by the richness of their surroundings, which covered canvases measured by scores of square yards, and made priceless by the authentic handiwork of Titian, Tintoretto, and Veronese, blazing upon the gilded walls and roofs. Yet this was little more than an audacious display of public wealth—an outpouring, so to speak, of gilded and painted pageantry. But when Venice opens her arms to the pure and true arts, as she will show during the course of the next month, she will fulfil the promise of her poet:—"Supreme over all allegories and histories depicted in those multitudes of paintings, sits Venezia herself, enthroned and crowned, the personification of haughtiness and power—figured as a regal lady, with golden hair tightly knotted beneath a diadem around a small head proudly poised upon her upright throat and upright shoulders." This, it must be understood, is to be the masterpiece of the exhibition; and we have not as yet even done with the central figure, before allowing ourselves to wander among its other enchanting miscellanies. We are to pass from her to Tritons, sea-nymphs, and Neptune, offering pearls; Justice with a sword; Peace with an olive branch; and a whole history of Venice, soon to be shown, in dazzling lights and colours, upon emblazoned walls; most of them the works of Venetians ament the deeds of their brother or ancestral citizens. On every side, above, around, wherever you turn in these vast saloons, are seen the deeds of Venice—whether painted histories of her triumphs over the Emperors, the Popes, the Turks, or allegories of her grandeur; stupendous scenes—as the historian writes—between the Doges Graviani, and Loradani, and Gritti, and Contarini, and Farioli, and Dandolo, fulfil achievements of faith, with St. Mark for their protector and Venezia for

their patroness. Born of these ideas, immense galleries of saintly scenes and portraits have, as it were, been unconsciously erected by the Venetian school. Thronging multitudes of saints, from the colour-flooded easels of Palma and Tintoretto; superb contrasts of light and colour; imposing effects of attitude; grand attitudes, "gorgeous nudities," as the phrase runs at Antwerp, with reference to Rubens; and such a mundane pomp of many-hued apparel, mingled with elaborate mythologies of Greek and Roman origin, fantastic arabesques, and exquisite episodes of pure idyllic painting, that, in a Venetian gallery, we are inclined to doubt whether we are in Venice at all. It will be interesting to note what will be, in its forthcoming exhibition, the historic and artistic challenge which Venice will throw down before the world. Art was, of course, a natural adjunct to the costly and voluptuous life of the Republic; not less necessary than that of Fra Angelico and Albert Dürer; but, as we find in the catalogue of the exhibition as yet unopened, there were jealousies and controversies in those times, and Tintoretto, with his separate and sublime vitality, talked of painting the saints in glory—a countless multitude of surging forms, a sea whereof the waves are souls—an acre of paradise, he calls it, in the background—with a stage full of bewigged gentlemen and powdered-headed ladies in front. This may not seem very Venetian to those who have followed what has been termed "the ideal idea" of that school; but it must be remembered, and will be demonstrated, if the approaching exhibition be at all honest, that the art of Venice, up to a certain period, was almost purely decorative; it was even more pompous, while less expensive, than that of the Renaissance, though always growing towards that mastery of colour and physical magnificence which bloomed to its perfection in the works of Titian and his contemporaries. The Vivarinis then arose, and fifty pictures, by representatives of that family of poet-painters, as they may justly be termed, will next month be exhibited, so to speak, on the banks of the Grand Canal. Fortunately, however, the Council of the Exhibition at Venice have prohibited the hanging upon their walls of the flayed skin of St. Bartholomew, and preferred to show the joyous, strong, and exuberant jewel-work of the bright masters upon whose easels and canvases blossomed flowers that scented the studio, prints that tempted the taste, Oriental stuffs, rubies and emeralds robbed from the rich graves of the East—graves far richer than its living palaces. In fact, they make no attempt at the visions of Angelica or Duccio; at no entranced dreams of solemnity which give a character—called by some people a charm—to the pietistic pictures of Van Eyck and Manding—artists who, by the way, are more allied than any other to the spirit of the first age of Venetian painting. Let it be hoped that, in the forthcoming Venetian Exhibition, we shall perceive a practical exposition of all this. It is impossible to forget that the Venetian school was, even in its middle prime—if the phrase may be permitted—bright colours in dresses, distinct and sunny landscapes, broad backgrounds of architecture, polished armour, gilded cornices, young faces of fisher boys and country girls; grave faces of old men brown with sea-wind and sunlight; withered faces of women hearty in a hale old age, the superb manhood of Venetian senators, the dignity of patrician ladies, the gracefulness of children, the rosy whiteness, and amber-coloured tresses, and black eyes of the daughters of the Adriatic and Lagoon—these are sources of inspiration to the Venetians of the passing period. But what of the pictures they purpose to exhibit? There is a grand canvas, painted by Gian-

Bellini, a painter belonging to the second period of the Venetian Renaissance, and who, in his altar-pieces, falls not far short of Fra Angelico, Fra Bartolommeo, Francia, and Perugino, though he never consented to confuse and sacrifice some points of his artistic theory with theirs. It is in this that the actual value of his comparative illustrations has consisted. Yet how have these mighty painters fared in the consideration of their contemporaries, and, consequently, of their successors? The Venetian Exhibition will lay the entire story before us. There is Bellini, the master colourist of Venice, who perished fifty years after his birth of sheer starvation; then what became of Tintoretto, called by the Italians "the thunderbolt" of painting, because of the impulsiveness and rapidity of his execution in painting? But still we have to summon the Venetian groups and landscapes to the exhibition, the curtains of which are now about to be drawn. There will be Tintoretto and Veronese in their most triumphant attitudes; also Titian, the Venetian Sophocles, and then the five Pietas of the Florentine and Venetian schools. The Venice Exhibition, admired as it must be, under any aspect, will be a picture of past, and future, and everlasting art—not for any living, dead, or passing generation to judge, but for every age, while mankind is conscious of power, and power to recognise and admire.

THE BUILDER'S CLERK.*

THE builder's clerk is often as ill-considered an individual as any to be found in the responsible ranks of civilised society. He is obliged to pick up his knowledge in the best way he can, and is left pretty much to his own resources. To the business of an ordinary clerk he has to add such a knowledge of the various trades of building as will enable him to perform his services with advantage to his master. Mr. Thomas Bales has come forward in the interest of this useful class, and has published some good advice in the shape of a little handbook, now before us. We need scarcely say it is the only work of the kind that addresses itself directly to the builder or managing clerk, and as such we have no hesitation in recommending it to that numerous class of readers. The greater portion of the work has already appeared at various times in the pages of the BUILDING NEWS, and the author has now reproduced it in a combined form for the use of those connected with the clerical part of the builder's business. The author, we are sure, will be amply compensated for placing within the reach of junior clerks a little book that will relieve them of much unnecessary labour and anxiety, and for pointing out to them those methods of business which experience has taught. Many a trifling duty that a builder's clerk may now regard as a mere drudgery will receive a new interest from the perusal of the pages of Mr. Bales' little manual. Thus, the author points out the advantages to be derived from care and attention in the checking of invoices and accounts—one of the first and often-despised duties of the young beginner. A knowledge of prices, so indispensable as a foundation to a knowledge of the builder's business, is learned by this means, besides an insight, however vague, of the modes of measuring material and labour. It is truly remarked, "nothing is so mean or insignificant as to be done without thought." It is unnecessary for us to repeat any of the useful advice of this book; we may, therefore, merely point out one or two of the lessons, to indicate the nature and extent of Mr. Bales' suggestions. A

* The Builder's Clerk; a Guide to the Management of a Builder's Business. By Thomas Bales. London: E. and F. N. Spon, Charing-cross.

general idea of the duties to be done by the junior clerk in his chrysalis state is given, and many useful hints are thrown out that will turn much that is regarded as wearisome and monotonous into pleasure. The value of thought and observance, application, temperance, deportment, and other qualifications are impressed upon the young clerk, but we pass on to notice a few remarks in the chapter on "Book-keeping." The checking of material is strongly insisted upon, and the clerk should see that everything that leaves the builder's yard is entered there and then. We are quite convinced of the truth of the remark that in many establishments the time belonging to one job is charged to another. Time-sheets should always pass through the hands of the foremen of the different trades, so that the accuracy of the entries may be certified; and once a week these sheets should be abstracted, and each account fully entered in the day-book. The form of doing this is pointed out. Labour and material should be classified as in the "abstract" of a bill of quantities. Speaking of "Prime Cost" the author shows the great consequence of its knowledge. We here quote some useful remarks upon the subject:—"If it be the wish of the builder to ascertain what the cost of erecting any particular building would be, without regard to the cost of the component items, his wish can be gratified in a very simple manner by adopting the following mode of procedure: Having firstly abstracted the day-work from the time-sheets, the contract work alone remains, and on going carefully through it he can summarise the amount expended upon the building, during the week, for labour. Then, turning his attention to materials, he can collect from the week's entries the various articles sent to the building from his own premises, and the invoices and carmen's notes will yield him particulars of goods from other sources . . . to these would be added a percentage for his supervision, office expenses, wear and tear of plant, rent of premises, &c. . . . but he should not omit to add the commission paid to the quantity surveyor, on receipt of the first instalment." Another good suggestion is that the sheets be abstracted by a double operation, as a check, so that errors may be detected. Too much time and care cannot be devoted to careful analysis and abstracts, and we have known serious inconvenience arise from want of these methods. Thus, the stuff used by joiners engaged in any particular work should be collected separately with an allowance for glue, besides the time they have been engaged. Everything should be separated and abstracted; the timber should be returned by the foreman as in the rough, and in masons' work the same. Then the time and material account returned will give the amount paid to each trade, after allotting the material. Very necessary, too, is the caution given to credit each work with its own material and labour, so as not to produce confusion and inaccuracy in the accounts. In some large businesses we know this is a source of much trouble to architects and clients. The author recommends the adoption of a price-book carefully prepared and revised from time to time. The cost of materials and different articles should be noted as they are received in invoices, &c., adding to each item railway carriage, haulage, time of loading and unloading, storing, &c. This addition, less the discount, would give prime cost. The price-book may be improved by adding the percentage of profit to the prime cost, placing the amount in another column, thus:

PRIME COST.			DAY WORK.		
Lead per cwt.	£ s. d.	25 p. c. per cwt.	£ s. d.	qr.	qr.
" "	qr.	" "	" "	lb.	lb.
" "	lb.	" "	" "	" "	" "

Thus it may be adapted to day-work

accounts. As regards "joiners' shop-work, it is necessary to abstract the time from the foreman's return, and having made a full descriptive heading, accompanied by an accurate and small scale plan, section and elevation, proceed to enter such time, and take the return of material—which ought always to be in the rough of the original sizes—abstract, it and collect it as 'cube,' 'super,' or 'run,' adding thereto such items of ironmongery, nails, &c., as are indispensable." This will give the prime cost to be entered and indexed, and can be readily turned up when required in pricing, estimation, and schedules, &c. The plan also enables the builder to estimate the services of good workmen at their true worth. Some useful hints are added concerning machine work, how it should be charged; and in large businesses the importance of guidance in this matter is considerable. We find the author recommending that all expenses caused by and arising out of the use of machinery be collected and made chargeable to all the work leaving the shop. This is perhaps the simplest mode, but care is necessary in apportioning to each work its fair share or percentage. Useful hints on trade expenses, "extras," stock-taking, estimates, horse labour, and dealings with architects follow. To the latter chapter we call the attention of the managing clerk, particularly those who indulge in what the author calls "'cutness." Every builder's clerk, young and old, will read Mr. Bales' little work with profit, and turn from the perusal of it with a higher notion of those little daily duties he now considers irksome.

ARCHITECT'S WORK AND THE WORKMAN'S WORK IN A BUILDING.

SO much attention is every now and then being called to the state, manually and mentally, of the *working man*, that it must always be of interest to ascertain with ever-increasing precision what he, the workman, now is, and what he in the future may be and ought to be. How different must have been, in the days of Phidias and his Greeks, the position of the workman to his position nowadays! Was it then better than now, or worse? The *modus operandi* in the creation of an artistic work, as a public building, in the old Greek days, and of one in these modern days, how diverse! Trite as it seems, this is all but a new subject, for the *mode* in which, or by which, any work of art is produced has excited but a languid public interest, and even among artists themselves it has not been regarded with that earnest and fixed attention which the subject would seem naturally to call for. Yet is the *workman's* part in the production of a building, whether it be great or small, of infinite moment and interest. The mere *masonry* of a large structure in past days all but always attracts the attention of the traveller and antiquary, and this masonry is the work of the workman always. It is really surprising to find how little of interest there is, in spite of efforts, to test the capacity of our working men. In the attentive survey and measurement of much of the old mason's work, to cite an example, as contrasted with that of the present, so artistic is it that we can hardly be said to be looking at the same operation. Let us take a notable instance of this, judging of it as we best can, and looking at the palpable facts of the case as far as they can be seen. Past and present modes throw light on each other. We may and can, by earnest and attentive looking at, see a little into the actual *modus operandi* of the building and construction of the famous Parthenon, or Temple of Minerva, on the

Athenian Acropolis. Enough of it remains to tell the way of its building, and it is, perhaps, in many ways better worth the pains of finding this out with exactitude than in the case of any other building ever erected anywhere, from the fact of the extreme care and high artistic skill which was employed on it as a whole, and more especially, for our present purpose, on that portion of it which is commonly thought to be more the province of the mere workman. We allude to the simple masonry of the building, irrespective of the carving, or sculpture, or decorative part of it. It will be found to define, to a very considerable extent, the duties of the architect, as well as the workman, in the old Greek times—in the days of Phidias, of Ictinus, and of Pericles. It is an infinite pity that we have no working man's record of the actual state of this famous building—working drawings to a large scale—just such drawings, indeed, as would be required nowadays to guide in the re-erection of this very temple. It may, we think, fairly be doubted whether any drawings, such as we now understand them, were thought of in the erection of this antique temple, or indeed of any of the old-world architecture. But, be this as it may, it is quite certain that no showy drawings and "perspectives" were ever dreamt of. We may readily fancy the level platform of solid natural rock on which the future temple was to stand, and with this plainly in view, and then, with or without drawings, the absolute necessity there must needs have been for the constant presence of the master workman, who had it clearly in mind to provide, first, for the slight curvature of the steps that were to lead up to the future building, and their almost infinitesimal leaning inwards. Mr. Penrose has given, with great and praiseworthy exactness, the dimensions of these foundational beginnings of the famous temple. Let us give a few dimensions by way of illustration and proof. The proportions of the upper step were as 4 to 9, with an average width, at west and east ends, of 101.344ft., and an average length, at north and south sides, of 228.147ft. The inclination of this upper step is .023. This proportion of 4 to 9, be it observed—and it is a most curious fact in the proportioning of the Parthenon—is not quite, but very nearly, in these proportions, and it has been shown that the very requirements of the construction and working-out necessitated this difference, it allowing for the space taken up by the mason's line to hang clear of the work. Such was Greek work, and we here cite it only for the purpose of showing how the old architects worked, and how impossible it was to trust such fine work as this to subordinates. The architect-workman of the building must himself have handled the rule and plumb-line here, and, though not cutting the stone out of which the steps were made, must have drawn and measured as well as thought. Such building refinements as these can only come of the personality of the artist acting for the time as a workman. It is as in the painting a picture, the mental perception is but half the work; there must be as well the manual and manipulative skill to work out the artist's thoughts. Such work as this cannot be deputed. These few glances at a work of mere masonry, and at what is required even here when the work rises to a high artistic level, are specially interesting at the present moment, when there is question as to the precise vocations of the architect and workman. We have but looked at the first steps in the construction of a great antique building, and we have found, not only the thought of the master architect, but the evidences everywhere of his handywork as well. It is, too, of special moment just now, as a daily-increasing

interest is being manifested in the work of the old classic times, in the antique Greek work of all dates, not simply in those of its perfection in the days of Pericles and Ictinus. It reverts to those so dim and distant as the era of the building of Troy; and there can be no doubt that as the magnificent language of the Greek people followed a progress, so did the building and architecture do so too. Here all about us there is an infinite variety and mixture of all styles and dates of art and building: in the old Greek days there was but one. No contrast can be greater, and the time will doubtless come when we shall have a connected history and chronology of Greek architecture from beginning to end. To architects, as a matter of course, and to all engaged in "building," such a subject must at all times be a matter of special, not to say inexhaustible, interest, but at this moment it must needs be the more so from the fact of the startling discoveries of Dr. Schliemann in the plains of Old Troy. This famous city has, for a long succession of ages, filled at least the "imaginative faculty" of mankind with right wonderful and attractive thoughts, and perhaps dreamings, but never was it thought that we could ever see any vestige of its buildings, still less come to touch the very tombs of its heroes! We can, indeed, but look again and again at those evidences of the handiwork of so distant a past, and endeavour to imagine what the architects and builders and workmen then living in it really did, and how they severally worked. Putting all dreamings, however attractive and poetic, aside, and even for the moment forgetting, if possible, Homer himself, we may look now at the very material work itself, and at the evidences it affords of the state of the arts, of fine art, and architecture, and building, as they then were, and as then in practice wrought out. We see, indeed, into the beginnings of Greek art, and are able thus to look at it from first to last, and to wonder, maybe, as to what special quality in it there was to so attract the attention of the world and to bewitch it. Its influence has been felt by all who have ever seen it, and, so far from being a dead thing now in these advanced days, it is in reality greater in this world's estimation than ever before. This is, indeed, so wide a field for thought and speculation, and so much that is noteworthy has already been said and written, that we would here hint only at the action of the Greek workman. In the days of Old Troy what was the workman? Was he an artist-workman, or did he simply follow and carry out the plans of men more instructed than himself, in a mechanical and, so far, unthinking way? A vital question this, for in these remains, thus marvellously brought to light, we see the evidences of the artistic hand of the workman, and to them we must, in the first place, give attention. If the all-but-perfect sculpture of the Parthenon, the "metopes" and frieze figures, tell us plainly of what the artist-workmen of the age of Pericles did, then must we see with equal clearness what they of Troy, and Argos, and other famous cities did, as they are exemplified in the Mycenæ Gate of the "Lions." If Phidias himself, as without any doubt he did, worked at the "metopes" of the Minerva Temple, then most surely did the nameless sculptor and workman of the lions on the Mycenæ Gate himself work at those ruder, though so remarkable and characteristic, sculptures. We cannot doubt this: he must have both designed—to use that perhaps a little ambiguous term—and wrought them out. Very much more will have come to light when Dr. Schliemann's series of photographs are published, and his more full and detailed account of this gateway and its construction, and especial meaning and signification.

And if this impress of individuality be thus visible in the work of the sculptor as working artist, then again must it obtain more or less in buildings, simply as buildings, as in the so-called "Treasures" in the masonry of the gates, and even in the walling of the towns. Many may demur to this, but surely, if the Parthenon mason's work evidences, as it does, the high artistic skill, as well as manual skill, of the workman, all doubt must disappear as the subject is more closely looked at and studied. If the sculptor's work on the Parthenon is a marvel of artistic power, then is the masonry of it all but equally so. A new subject offers itself here, for but little interest is nowadays manifested in simple wall-building and masonry, and but seldom indeed is it that we hear of the workman's skill in a building being pointed to as a something to be looked at and studied, and individualised. But why not? No one can look into the work of the Egyptian pyramids and temples, at the Greek masonry, whether early, like the work in the Treasures, or in the later work, like that of the Parthenon, without being struck with the extreme accuracy and artistic beauty of their workmanship, although but mere wall-and-column building. We can but hope that these remarkable discoveries of Dr. Schliemann's among the earliest of Greek works may throw additional light on the vocation and action of the workman and architect in art. In archaic work, amidst which he is at work, this must needs be visible, for it is there seen as the workman left it.

C. B. A.

ORNAMENTAL IRONWORK.*

THE earliest historical reference to iron is found in Genesis iv., 22. "Tubal Cain, an instructor of every artificer in brass and iron," lived, according to Biblical chronology, about 3700 B.C. He is supposed by many, and with good reason, to have been the same as Vulcan. He was not merely a smith, but he was an ornamental ironworker, "an instructor of every artificer." The Hebrew word *khoresh*, "artificer, cutting instrument," is akin to *kheresh*, "cunning worker;" both being derived from *kharash*, "to cut, carve, engrave, sculpture." Among other Biblical allusions we may note "an instrument of iron," Numb. xxxv., 16; the giant Og's "bedstead of iron," Deut. iii., 11; "chariots of iron," Josh. xvii., 16; "saws, arrows of iron, and axes of iron," 2 Sam. xii., 31; "chains and fetters of iron," Ps. cxlix., 8; "an iron pillar," Jer. i., 19.

Some doubts have been expressed whether Homer knew anything of iron, but Hesiod, who, according to Herodotus, was a contemporary of Homer, speaks of the "iron age," and the money of Lycurgus was in circulation about 850 B.C. Notwithstanding the interference of rust with the preservation of ironwork, iron hatchets have been found in the Etruscan tombs; an iron forge, tools, and nails among the lake dwellings of Switzerland; and iron pillars are still standing in India, which are supposed to be more than 1,500 years old. Rings, both of gold and of iron, circulated as money in Britain at the time of the Roman conquest, but they were probably imported. Ironworks were in active operation upon the island A.D. 120.

The peculiar combination of carbon with iron, which we call steel, and the art of tempering, seem to have been known in prehistoric times. At the beginning of the Christian era the best steel was imported into Rome from China, that of Parthia being of inferior quality. Steel armour was in common use among the soldiers of William the Conqueror. Steel was manufactured in Sweden as early as A.D. 1340, but the art of fusing steel in a crucible, and then casting it into bars so as to form a homogeneous "cast steel," was invented at Sheffield in 1750, and was long kept secret. Bessemer steel is prepared by forcing a powerful current of air through a quantity of melted

iron. The oxygen of the air, uniting with the carbon and silicon and other impurities of the iron, produces a rapid combustion and intense heat. The blast is continued until the carbon is nearly all consumed, when an alloy called "ferro manganese" is added, in such proportions as are needed to recarbonise the metal and produce such a "low" or "high" grade of steel as may be required. The largest present use of Bessemer metal is in the manufacture of steel rails of a "low" grade, combining great tenacity and durability, with slight brittleness and feeble tempering properties. The bends and twists and cuts and tensile tests of the specimens on the table show how admirably this material is fitted for artistic ornamental treatment.

The art of casting iron seems to be quite a modern one, but the date of its invention is uncertain. There is a cast-iron grave slab in Sussex, made about A.D. 1350. A minute proportion of phosphorus, which renders iron wholly unfit for the Bessemer process, adds greatly to its fluidity, as is shown by the remarkably sharp and beautiful ornamental castings in Berlin iron. The Centennial display, by American ironfounders, of cast statuary, vases, railing, bronzed and enamelled work, stoves, grates, &c., showed a taste of design and care of execution worthy of almost unqualified praise. The architectural combination of cast and wrought iron, in the structure of the main building, also produced many pleasing and commendable effects. But there seems to have been little thought of the admirable results which might be reached by a treatment similar to that of the best Japanese bronzes; the casting being regarded merely as a convenient way of forming a mass which can be more readily cut into shape than a larger piece of metal.

Both cast and wrought iron admirably illustrate the importance of the great natural principle of oscillation or vibration. It is now commonly believed that no two material particles are in absolute contact, but that, even in the most solid substances, there are continual internal tremors and orbital motions, much more complicated than those which keep the planets and "stars in their courses," and yet governed by similar laws. In consequence of such internal motions, glaciers and rocks and metals can be made to "flow," not only through the intervention of the fiery fingers of heat and flame, but also by simple continuous pressure. Mr. Tresca, who has studied the subject very carefully, is unable to find any limit between the fluid and the solid conditions of matter. There are merely differences of viscosity, analogous to that between water and molasses. By means of this flow, iron and many other metals may be rolled into sheets, drawn into rods or wires, or hammered into various desired shapes by skilful workmen. Here is a core-chuck, which can be put into a turning lathe, for shaping a flat disc of metal into a hollow vessel. As the chuck revolves, a gentle steady pressure causes the flowing particles to adjust themselves to its sides, so that, by having proper cores, we can "spin" bowls, vases, teapots, creamers, and various useful or ornamental dishes with great rapidity.

After the vessel is spun, it may be prepared for ornamenting by vibrations and flow of another kind. You remember the beautiful "repoussé" work in many of the departments of the Exhibition, and some of you, doubtless, were curious enough to inquire how it was made. The old method was by simple, careful hammering from the back; but there was always danger of an unlucky blow, that would break the metal and ruin the work of many days or months. Here is a "snarling," or repoussé* iron, firmly fastened in a vice. Mr. Kridler has kindly sent us one of his skilful workmen, who will show us the process of snarling. The floral or other design is drawn on the outside of the vessel, and you see that when Mr. Sloan hammers on the end of the snarler which is nearest the vice, the whole tool is set in vibration, and the rapid, gentle taps of the other end gradually raise a knot or snarl of the desired height and outline. After the snarling or repoussé work is done the

chasing process follows. The hollow is filled, as you observe, with a softish cement, which yields slightly to the pressure of the chisel or graver, or such other tool as the artist may select from this large assortment, and the design is thus wrought out into the beautifully finished details of stem and leaf stamen and petal, and tendril and delicate veining.

Iron is fitted by its cheapness, strength, elasticity, malleability, ductility, and plasticity for general application to ornamental uses, and for taking expressions in tracing and foliage such as no other material can supply. The processes which I have just explained furnish an immense addition to the facilities of the artisan for the expression of his thoughts, and make it the more wonderful, as well as the more deplorable, that the æsthetic treatment of wrought iron and steel should have become so nearly a lost art. In all parts of Europe there are many mediæval specimens preserved, which are worthy of special study. Candelabra, grilles, railings, newels, balusters, crosses, brackets and rings for cornice-poles, chapel screens, gargoyles, vanes, bolts, hinges, locks, keys and escutcheons, knockers, handles, and rings for bells and doors, are decorated with *eisen-blumen* or flower-work of beaten iron, or with various tracery, both serious and grotesque. They display an exuberance of invention and judicious taste which are calculated to enhance our respect for the earnestness and thoughtfulness of the unknown workmen whose resounding hammers so lastingly imprinted lessons of faith, hope and love.

In Germany, Bohemia, Switzerland, and especially in the Tyrol, men in armour, bears or other animals, skilfully wrought, and holding the flag of the district or canton, are often found in the public squares or market-places. At Jenschbach there are remains of ancient smelting works, and of a forge which seemed specially devoted to a peculiar symbolic teaching. The great grey stone houses of the village are adorned by emblems of love and social feeling, being nearly all protected by curious huge dolphins, which are apparently just on the point of flitting from the water-spouts. In nearly every village church or graveyard the artistic eye may be gratified by contemplating the taste displayed in a cross, or a rood screen, or an altar-gate, or a chandelier, or the ridge-cresting and terminals which wed the Gothic architecture to the sky and landscape, as if with a fringed network of delicate lace on the delicate grey, and against the blue. Sometimes the rods of the screen are so arranged in perspective as to represent an iron-arched arbour, under which one must walk in traversing the length of the aisles. Sometimes the symbolism is made still more expressive by combining rich clustering vines with the intricate blossoms of passion flowers, displaying a wealth of tendrils and leaves naturally and gracefully entwining the palings of a simple or rustic gate; always evidences of devout aspiration, childlike trust, deep feeling, and loving labour, such as to bring us into a reverent sympathy with the artists who sought to give visible utterance to some of the most universal and most far-reaching longings of humanity.

Near the west door of Antwerp Cathedral is a well with Gothic canopy and tracery of iron, surmounted by the statue of a knight in armour. It was executed, in 1480, by Quintin Matsys, "at one time a blacksmith, afterwards a famous painter," whose romantic history is briefly commemorated by the inscription on a neighbouring tablet, "Connubialis Amor de Mulcebre fecit Apellem" — connubial love made Apelles from a Vulcan. It is said that this first "learned blacksmith" fell in love with a painter's daughter, and in order to obtain her for his bride he changed his profession, acquiring even greater reputation as a colourist than he had gained by his handiwork at the forge. In the knowledge of that universal language which rings so sweetly in the ears of youthful admirers, he set a precedent for the learned blacksmith of our own days; but, unlike his far-famed successor, he manifested no disposition to trace the universal language into all its dialects. His parity of success in his two vocations shows that he had the fire of true artistic genius, and his fame may encourage the wielder of the hammer, as well as the sitter at the easel, to look for an

* Abstract of a lecture in Prof. PLINY E. CHASE'S course on "LESSONS OF THE CENTENNIAL," delivered before the Franklin Institute, March 13, 1877.

* The terms "spinning" and "snarling" seem to have been borrowed from the textile arts. The French word "repoussé" signifies "pushed back," indicating the mode of hammering.

ever-ready appreciation of whatever depth of thought finds expression through patient, faithful work.

It is a quarter of a century since the first London "World's Fair" revived a European interest in the capabilities of wrought-iron for artistic uses. The progress of the revival is most strikingly exemplified in the Oxford Museum, which was erected in 1867, but traces of it are to be seen in all directions, about the modern public and private edifices of Great Britain, as well as in many of the churches. A notable example of good ecclesiastical work is the Hereford Cathedral Screen, which was shown in the International Exhibition of 1862, before it was removed to the place for which it was designed. Dr. Dresser speaks of it as one of the finest examples of artistic work with which he is acquainted. The grilles, altar-rail standards, and English fire-dogs, in the present Loan Exhibition of the Pennsylvania Museum and School of Industrial Art, placed, as they are, beside a pair of ornamental Florentine andirons of the sixteenth century, show that neither good taste nor skilful execution is wanting in the smiths of our day, and that an educated demand will call forth work which may challenge comparison with anything mediæval. The pagoda-like pavilion of Messrs. Hart, Son, Peard, and Co., with its great variety of contents, cast, woven, or hammered into "joys for ever," justly claimed a large share of attention from the visitors to the main Exhibition building; and in the Belgian department, Prosper Schroyer's door, with its wrought-iron vines, grapes, and bunches of climbing flowers, furnished more food for thoughtful study than the rich laces and costly embroideries which surrounded it.

Philadelphia already shows the effects of the revival; but, unfortunately, the most satisfactory ornamentation is imported. The magnitude and importance of the iron and steel interests in the Keystone State should stimulate our ornamental designers, architects, and contractors to a generous rivalry with their European brethren. Elkington's Helicon Shield showed admirable effects from working steel with other metals by "appliqué," inlaying, and repoussé; the Spanish, Moorish, and Indian departments contained much successful punching, pressing, and damascening; the Russian electrotypes in iron, by the Jacoby process, gave a delicate surface finish, which might be often used artistically with great advantage; the plasticity of steel through its capabilities of alternate softening and hardening, and the elasticity of its graceful shapes when finally and permanently tempered, were everywhere full of suggestiveness. Shields, suits of armour, weapons of war, knives, kettles, steel and iron jewellery, and other articles of personal or household decoration, were well represented, most of them adorned with traditional and conventional embellishments which have been handed down from a remote antiquity. Let our wise designers study such examples; let them cleverly combine the different ways of working and different styles of ornamenture; let them learn from the worker in bronze, the goldsmith, and the jeweller, new devices to charm the eye and elevate the imagination; and their field of labour will be so much enlarged that they will seem to have invented a industry.

I have spoken of the symbolical thought which was so generally expressed by the ironworkers of the cinque-cento. How can it be better revived and expanded than by taking lessons from the old schoolmasters of Eastern Asia, "these from the land of Sinim?" The gipsy kettle, as it is often called, the common bulged tripod dinner-pot, which is used the world over, is copied from Chinese incense-burners that were in use more than five thousand years ago. The Chinese have long had a mania for collecting old bells and vases, partly from their universal reverence for antiquity, partly for the severe simplicity of outline and garniture by which the articles are generally characterised, partly for their moral lessons and associations. A motto from Confucius, or a line of wise advice from some other favourite author, is commonly cast, stamped, or cut into the bronze; "the all-seeing eye," under various forms of conventional treatment, looks from the outer surface, even as it looks

from the amulets and edifices of Egypt and Yucatan; the three feet are said to represent the three guardian spirits that watch over the Emperor, the nobles, and the people. Nearly all the old metallic vases have a special history, independent of their antiquity, for it has been a practice from time immemorial to use them as presents from princes and nobles, and men of wealth or station, to those whom they wished to honour. In the magnificent and unique collections of *cloisonné* enamels which adorned the Centennial, the delicate filigree, and the richly variegated hues of the cellular glazing, seemed to be lavished with a peculiarly loving tenderness on the old homely and home-like form which we all know so well. Our workmen enamel iron skilfully for common purposes; who doubts that they might rival their almond-eyed brethren in applying the art to æsthetic purposes, if they were rightly encouraged? Any ornamentation upon articles of daily use, especially if it be symbolic, or otherwise suggestive of high ideals, may become a source of continual gratification and of constant ennobling instruction.

I can think of no decorative process that has ever been employed upon any metal which is not equally suited for iron; indeed, I doubt whether there is one which has not been repeatedly and successfully tried upon that most precious metal. A judicious Renaissance may lend new force to the Jewish legend which has been so well illustrated, by Schuessle with his brush, and by Sartain with his burin. The story runs, that when the Temple was finished Solomon gave a feast to his artificers. On unveiling the throne, a blacksmith was found in the seat of honour, on the right of the king's place. The people clamoured, and the guards wished to cut him down, but Solomon commanding him to speak, he said: "Thou hast, O king, invited all craftsmen but me; yet how could these builders have raised the temple without the tools I furnished?" "True," answered Solomon, "the seat is his of right. All honour to the ironworker."

WATER JETS FOR EXTINGUISHING FIRES.

A REPORT was presented to the Metropolitan Board of Works, on Friday, by Sir J. W. Bazalgette, their engineer, and Messrs. F. J. Bramwell and E. Easton, C.E., relative to the engineering questions involved in the extinction of fires, more especially that of the proposed substitution of hydrants for wooden fire plugs. Since 1871 the constant supply system has been gradually brought into use by the water companies of the metropolis, and propositions have been made for the replacement of plugs by hydrants throughout the metropolitan area, in order that jets of water may be directed from the mains against a fire without the intervention of steam fire-engines. In order to ascertain the extent of hose friction and heights of jets a series of experiments were made by the three engineers whose signatures are appended to the report, at the pumping station of the South Essex Water Company, at Grays.

To the final test conducted before the members of the Select Committee of the House of Commons on the Metropolitan Fire Brigade of the Metropolitan Board of Works, and the directors and officers of the several water companies interested in the question, we referred in these columns on June 15th last (p. 591). They conclusively showed that not merely is there a reduction in available head due to the friction of the hose, but that there is a large reduction due to the friction of the water through the mains and pipes leading to the hydrant. When the quantities of water per minute and the diameter of the hose are constant, the resistance varies directly as the strength, and is equivalent to the square of the quantities. The ratio of available jet that can, under favourable circumstances, be directed upon a given point may be estimated at $\frac{1}{3}$ ths—62½ per cent.—but is not uniform, as with a very low jet the velocity is so small that the air offers no appreciable resistance; whereas with a lofty jet the necessary increase in velocity meets with a far greater retardation from the friction of the air, and this notwithstanding the largely-augmented supply of water expended in a given time. It has also

been established that when pressure is reduced in a main by a draught of water at some point in its length, a further draught aggravates the loss due to the first one, the total decrease in pressure somewhat exceeding that produced by either draught separately. This points to the serious diminution that may be caused in the available head by comparatively small domestic draughts along the line of main.

These facts, and the consideration of the statutory obligations of the water companies, confirm Sir J. W. Bazalgette and Messrs. Bramwell and Easton in the opinion that, under present circumstances, adequate jets for extinguishing fires cannot be obtained by the waterworks pressure. They further point out that a fireman can just as easily extract a fire-plug as turn a hydrant; in any case the presence of the turncock is necessary, as he alone knows how to shut the various cocks, so as to prevent water being taken for domestic purposes. It is also pointed out that there is no necessary connection between constant service and high pressure, for at the most the former can only be construed to mean delivery to the top story of the highest house—a wholly insufficient pressure for effective jets.

In conclusion the three engineers state that, "after having given the most anxious and careful consideration to the subject for a very long time, having made elaborate and searching experiments," they "have no hesitation in saying that the advantages to be derived by the adoption of hydrants throughout the metropolis, under the present condition of things as regards pipeage and obligatory pressure, would be the occasion of a very large outlay—from £750,000 to £1,000,000—for which no adequate return would be obtained, and that if this outlay were incurred, and the hydrants were put down, in all probability it would be found, some few years hence, that the expense would have to be practically re-incurred, if the supply of water to the metropolis for the extinguishing of fire were arranged upon some different and upon some comprehensive basis."

THE CRYPT OF ST. PAUL'S.

A PART of the vast crypt under St. Paul's has been recently formed into a chapel for early celebrations, which, however, is not regularly closed in by any architectural additions to the structure, but consists simply of a carved wood communion table, raised upon a solid podium ornamented with mosaic work, immediately beneath the eastern part of the choir, in the place which would be called the apse of the Cathedral, the table being a considerable distance from the east window, from which it is chiefly lighted. Around the table, and for a large space in front, extending to the side walls of the aisles, a pavement has been laid down, designed by Mr. Penrose. It is intended eventually to carry out this tessellated pavement over the whole of the crypt, and, with this view, another large space had been finished previously to this chapel, forming the floor of the central columnar chamber, where the tomb of Nelson stands. The general design of the pavement is one throughout; but as the chapel is approached the geometrical spaces are more ornamental, and the whole is enriched with bright colours in the marbles as well as with sacred emblems, and four circular compartments containing the Evangelists. In these the azure of the lapis lazuli, the deep-toned red of the rosso antico, the Sicilian jasper, the giallo, and other precious marbles give sufficient brilliancy to be in keeping with the surrounding ornament without departing from the style of the old *musivum opus* which Mr. Penrose has adopted. A point of interest in this application of mosaic work is that it has been entirely done, so far at least as the mechanical part goes, by the hands of the female prisoners at the Woking Gaol. The table is of carved oak work, having spiral columns at the angles and panels, with a low dossal of simple character.

In Mr. Meakin's page advertisement last week, by an unfortunate error the name of the first mansion mentioned in which that gentleman's patent sash fasteners have been fixed was wrongly spelled "Tapley House." Most readers will probably have guessed that Apsley House, the residence of the Duke of Wellington, was the mansion meant.

BAILIFF'S HOUSE, WYFOLD COURT—INTERIOR OF PROPOSED CHURCH AT HARLESDEN—ST. MARY'S ABBEY, YORK—PROPOSED CHURCH AT GREENOCK—"BUILDING NEWS" CLUB DESIGNS FOR COTTAGES.

OUR LITHOGRAPHIC ILLUSTRATIONS.

INTERIOR OF ALL SOULS' CHURCH, TO BE BUILT AT HARLESDEN, N.W.

THIS view is taken from a sketch prepared chiefly to try the effect of the roof over the octagon, which forms the chief feature in the church. A view of the exterior is hung at the Royal Academy, and this we hope to give, with the plan of the church, at an early date. The construction of the roof, though perhaps novel, is extremely simple, consisting of four "queen" trusses crossing each other from angle to angle, and forming the valleys between the eight gables. The boarded ceiling, shown in the view, was designed to conceal the carpentry at a smaller cost than working that carpentry into ornamental forms. The choir is brought forward into the body of the church on the Basilican principle, and the apse merely contains the requisite space within the kneeling step. Mr. Edward J. Tarver, of Craig's-court, is the architect.

BAILIFF'S HOUSE, WYFOLD COURT, OXFORDSHIRE.

OUR double-page plate to-day illustrates in detail the bailiff's house (now used by the head gardener) of Wyfold Court, Oxfordshire. It was erected in 1872 for E. Hermon, Esq., M.P., a short distance from the mansion. The materials employed are red brick and Bath stone for the walling, with ash and fir timber quarterings, and barge-board gables. The roofs are covered with tiles from Reading. The accommodation, as shown by the plans, is of the usual character for such an occupation. Mr. George Somers Clarke is the architect.

ST. MARY'S ABBEY, YORK—VESTIBULE OF CHAPTER-HOUSE.

FOLLOWING the drawings already given of this series, illustrative of Sir G. Gilbert Scott's Royal Academy Lectures, and drawn by Mr. W. Samuel Weatherley, we complete the set to-day by publishing the restored views of the vestibule to the chapter-house of St. Mary's Abbey, York. This sheet of drawings, like the others, is now in the Royal Academy Exhibition. The following description of the plate was written by Sir Gilbert Scott:—"One of the most remarkable specimens of refined Norman of the highest class is at St. Mary's Abbey, at York, in the vestibule of the chapter-house. I give a restored view, partly from remains *in situ*, and partly from fragments preserved in the museum. The date of this most exquisite work is unknown; but I should suppose it contemporary with the later years of Archbishop Roger de Pont l'Évêque, the great promoter of the Transition in that diocese, and who presided over the see of York from 1154 to 1181. He rebuilt the choir of his cathedral, of which the very noble remains of the crypt were discovered a few years back of a very refined Norman style. He also built the palace on the north side of the cathedral, of which a most beautiful fragment remains. This fragment, though simple, and with round arches, agrees exactly in its details with the doorway at St. Mary's, even to the exact diameter and height of its shafts and capitals, and was, no doubt, executed by the same persons."

BUILDING NEWS DESIGNING CLUB—
A TRIPLE COTTAGE.

TO-DAY we illustrate our selection of the designs we have considered best in this subject. Our readers will see the relative areas and merits of plan in "Bee" in circle, "St. Lucy," and others. We refer our readers to our remarks, p. 616, for the reasons of our selection.

PROPOSED CHURCH AT GREENOCK.

THE church proposed to be erected at Greenock, of which we give interior and exterior views, was designed by Mr. R. Anderson, A.R.S.A. The drawing was exhibited this year at the Royal Scottish Academy.

ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETIES.

MIDLAND INSTITUTE.—The first walking excursion during the present summer of the archaeological section of the Midland Institute was held on Saturday last. The party was driven from Birmingham to Stonebridge, where they left the carriages, and walked through the fields, along the banks of the Blythe, to the little Norman church at Little Packington. The church is principally interesting from its rude masonry, and from the quaint timber framing in the interior that supports a small wood bell-cote at the west end. It contains a monumental tablet, bearing the Shakespeare arms, to members of the Shakespeare family. The members next walked along the lanes and fields, on the outskirts of Packington Park, and by the Packington bridges to Maxtoke Priory. Permission to cross Packington Park could not be obtained, that fine domain being now closed to artist or archaeologist, and given over to the occupancy of rabbits. Passing the Hermitage Farm, the members reached Maxtoke Priory, where Mr. Holliday exhibited a plan of and described the excavations recently made there by the section, with the permission of Lord Leigh, the owner. He pointed out that by means of these excavations the plan of the Priory Church, the cloisters, and the adjacent monastic buildings had been completely recovered; and announced that a full account of the result of the investigations, and of what is known of the history of the Priory, would shortly be issued to the members in a volume of the transactions of the section, now passing through the hands of the printers. A walk to Coleshill followed. After tea the monuments and font in the restored church of Coleshill were visited. The carriages were then rejoined, and a drive home through Castle Bromwich brought the excursion to a close.

WATER SUPPLY AND SANITARY MATTERS.

DUNFERMLINE.—The new scheme for supplying water to the town of Dunfermline has been commenced. A reservoir is to be constructed 13 miles distant from the town, to impound the water of the Glensherup Burn, and having a capacity of 180,000,000 gallons. The water will be conveyed to the town by means of a cast-iron pipe 12in. in diameter. Mr. French, of Blackhall, near Edinburgh, is the contractor for the reservoir, Messrs. Stewart and Creber, of Dundee, will lay the main and construct the measuring cistern, and Messrs. Laidlaw, of Glasgow, are to supply the iron pipe. The cost of the scheme is estimated at £55,000.

CHIPS.

THE parish church of Moxley, near Wednesbury, has been completed by the erection of a spire, and the erection of a clock and chancel window. The spire is 120ft. high, and is built of Codsall stone, having a pinnacle at each of the four angles of the tower. Mr. A. P. Brevitt, of Darlaston, is the architect. The chancel window has been executed by Messrs. Hardman and Co., of Birmingham.

New Church schools are about to be erected at Calverley, near Leeds, from the design of Messrs. T. H. and F. Healey, architects, of Bradford. The style of the proposed building is Perpendicular, and the estimated cost £1,600.

A stained-glass window has recently been erected in Holy Trinity Church, Coventry, to the memory of Dean Hook, formerly vicar of the parish. The window which is at the west end of the church, consists of 14 lights, and is occupied by figures of Our Lord as the Good Shepherd, St. John the Baptist, and the twelve Apostles. The window was executed by Messrs. Heaton, Butler, and Bayne, of London, at a cost of £600.

BUILDING OPERATIONS AT
NORTHAMPTON.

A CONSIDERABLE amount of activity has lately been manifested in the building trades of the shoemakers' metropolis; and a number of works are either contemplated or in course of erection. One of the most important is the extension of the General Infirmary. In accordance with plans prepared by Mr. Hull it is proposed to erect on the north-east of the main building, and in the north-west corner of the kitchen-garden, an out-patients' block. The whole will be built of white brick, with Bath stone dressings and facings, in the Italian style, with pilasters between the circular-headed windows. By having a cruciform ground plan, the rooms are arranged in the most convenient manner. It will consist of an accident-room, accident waiting-room, three physicians' rooms, three surgeons' rooms, eye and throat rooms, dispensary, with separate dispensing windows for men and women, and an extensive general waiting-room. Mr. Thomas Cosford is the builder, the contract being for £2,600. Messrs. P. and R. Phipps have commenced to erect commodious baths in the New-road, opposite the Cattle Market. The interior comprises a large swimming bath and private baths. In addition to the work of the Church Extension Society, other religious communities are moving in the direction of providing increased accommodation for their congregations. The Wesleyans are building a large chapel on the Regent-square, and another chapel in Queen-road for that district; and the Primitive Methodist body have put up a temporary erection in the Kettering-road. In connection with Doddridge Chapel, the schoolroom is being considerably enlarged. The present alterations, which are being made by Mr. Heap, according to plans prepared by Mr. Hull, will cost something like £1,170. St. Lawrence's Church, in Duke-street, is being progressed with satisfactorily. A short time ago the foundation stone of a new and extensive Board School, on the Kettering-road, was laid. The school, which is calculated to meet the present requirements of the north-east district, is very complete in its character.

In turning our attention to the places for carrying on business, we would first allude to the boot and shoe trade. Several small factories are being built in various parts of the town, but the principal ones are those of Mr. John Cave and Messrs. Kerridge Bros., in Overstone-road. Messrs. Kerridge Bros.' factory, which is being built at the corner of Overstone-road and Clare-street, by Mr. Heap, at a cost of £1,025, has a frontage of 57ft. 6in. to the former thoroughfare, and 60ft. to the latter, with an entrance of 7ft. 6in. at the angle. The building is of brick throughout, and will have no pretensions to ornamentation. Messrs. Blakey and Son, of Leeds, have about completed a substantial warehouse in Guildhall-road. It stands 69ft. high, and has a frontage of 45ft. It is built of red brick, with Bath stone dressings, and white brick pilasters between the windows. Mr. Ingman was the architect, and Mr. Bonham, of Edith-street, was the builder. Messrs. P. and R. Phipps are making extensive additions to their brewery in Bridge-street. A part of the old building has been taken down, and it is proposed to erect a new tunnyery in the yard, occupying also the site on which the old building stood. The whole is of red brick, with Bath stone dressings, and blue brick quoins and plinths. Its dimensions will be 120ft. by 54ft. The cellarage will be made to connect with the old cellarage. The first floor will be used as a landing stage, and will be laid with Claridge's patent asphalt, supported by cast iron columns, wrought iron girders, and brick arches. Messrs. R. Davison, Son, and Mackenzie, brewers' engineers, of Shorditch, High-street, are the architects, and Mr. Dunkley, of Blisworth, is the contractor. Messrs. Ratliffe and Jeffery are having a malting erected at the rear of the Crown and Anchor, Bridge-street. Dwelling-houses are being rapidly erected in all the outlying districts of the town. New streets are being developed where fields once stood between Bailiff-street and the Kettering-road; in the Corporation Close, now Hazlewood-road; and in the district lying between Wellingborough-road and Billing-road.

THE CAXTON CELEBRATION
COLLECTION.[From the *Echo*.]

PRINTING is so associated with the Fine Arts that such a collection as that at South Kensington, brought together to celebrate the 400th anniversary of the introduction of printing into England, has an interest for artists beyond the object the promoters of the celebration have in view. Those who desire to acquaint themselves with the ancient and modern typography, who wish to study the mechanical appliances of this "noble craft," and the various forms of printing now in use, cannot do better than spend a few hours in examining the valuable collection of typographical apparatus and the earlier records and block books to be found in the galleries at Kensington. The machines and models to be seen in operation in the lower room may give any one a fair idea of the recent improvements in the mechanical art in which machines and presses of every kind can be examined. There is, however, a little too much of the "advertisement" in this display, and we content ourselves with examining the upper gallery of old books and specimens of printing. We here find some of the earliest examples of block engravings, and the systems of printing of Guttenberg, Meerman, Heenecker, Santander, Koning, and others. The specimens of wood engraving, many of Albert Dürer's, such as those the readers of the *BUILDING NEWS* have had presented to them at different times, and some other rare prints of the 15th and 16th century, are especially interesting; and so is the collection of the earlier editions of the Bible and New Testament, many of them of extreme rarity and in good preservation. Thus we see the 1st edition of the present version of the Bible with the date 1611 in the Old English letter; another, a Slavonic Bible, 1580; and Bohemian Krulic Bible printed in 1587. A rather interesting portion of the collection is that lent by the Guildhall Library Committee, showing various styles of printers' types, vignettes, ornaments, tail-pieces, and other embellishments of early printing. Among the prints are illustrations and descriptions of royal pageants of the city of London, "Triumphs of London," as they are called, and these are generally of the sixteenth century. The cases of books printed by Caxton are extremely interesting, as showing the earliest styles of printing, soon after Caxton set up a press at Westminster, though how many of them are really genuine it would be difficult to say. We noted No. 130, the "Directorium Sacerdotum," 1st edition of second version, folio, with date 1417; "The Fifteen Oes," 4to, with a very piquant border and woodcuts, in which birds and flowers are entwined, printed by command of the Princess Elizabeth, Queen of England, by William Caxton (1490); the "Mirrour of the World," 3rd edition, lent by the Duke of Devonshire; "Fables of Æsop, of Avian, of Alfonso, and of Poge the Florentine," with woodcuts, "emprynted by me, William Caxton at Westmynstre, folio, 1484," lent by the Queen; "Canterbury Tales," by Chaucer, folio, with curious woodcut; "Rhetorica Nova," Abbey of St. Albans, and others. The "Fables of Æsop" are illustrated by a figure surrounded by a symbolic representation of the fables, and, as a specimen of an early wood-block hatched in coarse lines, we have seldom seen its equal. The "Chronicles of England," folio, 2nd edition, with long commas, and date 1482, illuminated by red capitals of straggling shape, is a fair specimen of the age. It may be interesting to many to say that previous to 1476 there were no separate titles to books; from about that date they began to be printed on detached leaves. Another peculiarity of the editions of the fifteenth century was the absence of capital letters at the commencement of divisions. In the early specimens of typography we find spaces to have been left, which were afterwards filled up by illuminators, who placed the initial letters in these spaces for those who purchased books—then of great value. We see many of such kinds of illuminated initials, embellished with gold and various colours. Another mark of this period was the rare occurrence of divisions, commas, and semicolons, and this originated no doubt from the great exactness with which the

printers copied the original MSS. We are struck also with the vellum-like thickness of the paper, the peculiar inequality of the types, and the use of abbreviations, all of which add considerably to the artistic appearance of fifteenth century typography. "The History of Reynard the Fox," folio, 2nd edition, 1489, is shown in a fac-simile of pages from the copy in the Pepysian Library, Cambridge. Of the same date is a copy of the "Directorium Sacerdotum," from the Bodleian Library. But the greatest interest centres in a small glass case, containing two folio editions, printed by Caxton, with the date, 1477. One is the "Dictes and Sayings of the Philosophers," translated by Earl Rivers, and printed by Caxton. This is described as the first book from Caxton's press, and is the foundation stone of the collection. The type is tolerably clear, and has red initials. The date, 1477, is printed in the body of the text of the last chapter. The other book is the "Recuyell of the Historyes of Troye," translated by Caxton, in 1469-71, and printed shortly after at Bruges. It is the first book printed in English. It is said the demand for this book was so great that Caxton could not transcribe copies fast enough, and he employed the new invention of printing to aid him. "The Game and Playe of Chess" was another—the first book in England, according to some authorities. This was printed at Westminster, and completed in 1476. But visitors to the exhibition will be still more interested in Guttenberg's Bible, printed 1450-55, taking six years—a large folio.

Considerable doubt has been expressed by authorities as to the real introduction of printing into England, generally conceded to Caxton, a mercer and citizen of London, and it is now almost unnecessary to dispute the generally received tradition. An old chronicle, with a date of its impression from Oxford in 1468, was discovered, or alleged to have been found, in the Archbishop of Canterbury's palace, and it was considered a decisive proof that printing was established in the University of Oxford some years before Caxton returned from the Continent, where he had been travelling many years in connection with his own trade. The fact may be mentioned if not worth much. There is some misunderstanding, however, as to the real value of Caxton's share in the great work, and it is right to say other places and men claim the honour of type printing. It is not worth while to contend that Corsellis, of Haarlem, adopted the same mode, when Caxton was the first to practise the art of printing with metal types in England. However, it must not be forgotten that the great discovery was the employment of separate metal types cast for the purpose, and not that of block printing in which the types were engraved on blocks of wood—a mode lost in antiquity. Mentz, Haarlem, and Strasburg, are places that claim the honour of having invented the art of type-founding, and every one knows that to John Guttenberg is attributed the invention of cut metal types, with which the earliest edition of the Bible was printed in 1450, and which is to be seen at Kensington. Cut wood or metal types were used. The last stage of the art consisted in casting the types in matrices, invented, it is said, by a partner of Guttenberg—Peter Schoeffer—and the first work printed on these is said to be "Durandi Rationale," in 1459. Very conflicting are the statements of authorities on the subject, but it may be considered tolerably certain that to Guttenberg is due the founding of metal types in a matrix, though his claim was contested at law by his partner in 1439. It was this process which constitutes the art of printing as we know it, and it is questionable whether moveable wooden types were used to print an entire book at that period.

Of course, the method of taking impressions from signets—wooden stamps in which the letters are engraved, to be seen in the British Museum—is a very ancient art. Wilkinson, Layard, and others have discovered many such means of impression in the form of clay, wood, and bronze stamps, while numerous ancient examples in papyrus, linen, and parchment show us the kind of impressions produced by these means. In the thirteenth century picture-printing from wooden blocks

was practised. To Lawrence Coster, of Haarlem, it is alleged, is due the block printing of the fifteenth century, when many books appeared printed in one-page blocks. The mode of separate wooden letters, cut to fit each other, followed, and Coster probably practised this also: at any rate it was this invention, to whomsoever due, that inaugurated the art of modern printing. Thus, it will be observed, the art has passed through five well distinguished phases—first, the stamp printing of antiquity; second, block printing; third, cut movable wooden letters; fourth, cut metal type, invented by Guttenberg; and fifth, casting types in moulds. All these phases of the art are to be studied in the collection at Kensington, though it would considerably have enhanced the interest if the books and cases had been classified and labelled with more care. We cannot fail to observe in the earlier specimens of type printing the great resemblance to the old manuscripts; and as works of art in which the individuality of the type-cutter is traceable, we cannot also disregard the difference the cast type introduced into the printing. Thus, from the time when the old religious recluse in the intervals of canonical hours fabricated his illuminated Bible or breviary, with all the patience of his art, to the mechanical printing of today, we trace a mechanical improvement going on simultaneously with a diminution of artistic zeal. We lose the cherubic initials in colour and gold over which hours were spent; but we have gained a thousand-fold in the multiplication of copies. It is yet possible for art and mechanical progress to meet.

THE COMMON COUNCIL AND THE
PROPOSED NEW BRIDGE ACROSS THE
THAMES.

THE Court of Common Council has made another blunder—almost as serious as that committed when it decided to widen London-bridge, and spoil it. As it had to be saved then from the consequences of the folly of its members, so once again outside opinion will have to be expressed, or a mistake will be made, the future consequences of which will be disastrous, and impossible to escape from. It will be remembered that after the final abandonment of the proposal to widen London-bridge, and the usual period of delay which invariably follows any successful attempt on the part of the City talkers to make up their minds about anything, a special committee was appointed to consider and report on the proposed new bridge. The report of this committee was presented on Thursday week, and the best that can be said about it is that it recommends the adoption of a makeshift. It is in favour of a low level bridge, with openings for the passage of ships, which, it is estimated, can be erected for £750,000, while it is asserted, a high level bridge with the proper approaches, would cost £2,000,000. In spite of the remonstrances of a few of the more sensible members of the council the report of the committee was adopted. Fortunately there is no immediate fear of the idea being carried into execution, as the assent both of the Government and the Metropolitan Board of Works is necessary first, and the money has to be found. Meanwhile those interested in maintaining uninterrupted the free passage of the river, had better bestir themselves. The navigation of the Pool is not too easy at present. Fancy it blocked by vessels waiting to be let through the proposed drawbridge, and that, in its turn, crowded by vehicles compelled to stand perhaps half an hour while the ships passed through. Badly as a new means of communication between the north and south banks of the river is wanted below London-bridge, we had better give up all hope of getting it if it is only to be obtained by turning the Thames into a lock for the sake of £1,250,000. The impracticable idea, however—which seems to have originated in the same brain that on a former occasion produced the fearful and wonderful design for spoiling Rennie's-bridge—will never be adopted. The bridge, whenever it is built, will be a high level bridge, not only because a high level bridge is wanted on account of the river traffic, but because the necessary approaches are almost as badly wanted as the bridge itself.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. X.

A Small Stable.

THE designs we have received for the first subject display considerable variety in treatment, though as regards plan the ordinary types have been followed, with scarcely enough attention to sanitary requirements and economy. Our conditions required a two-stall stable, with loose box, harness-room, and coach-house, and hay-loft, or granary, over some portion. The plans we have received divide themselves into two groups—those in which the stable and coach-house are embraced in one rectangular single-roofed building, and those in which either the stable or the coach-house forms a distinct wing or projection. "B," in a circle seems to be the nearest approach to what, in our opinion, a stable range should be, though we by no means consider the plan the best in all respects. The author adopts the simplest form of a single roof, the stable being at one end and the coach-house at the other, with the harness-room between them—a desirable position for it. We note, however, that the author makes his loose box distinct, and separates it from the stable proper. This is unnecessary in ordinary cases, though some grooms prefer it. It is made the whole depth of the building, or 17ft. by 10ft. wide, and has a distinct entrance, with windows on both sides of the doorway. There are two angle mangers. The stable adjoining, 17ft. x 12ft. 6in. and 11ft. high, with two stalls, has its entrance in the return side of the open lobby—a recessed part of the building formed by the harness-room, which is 10ft. square. The coach-house forms the other end of the range, and is 17ft. x 14ft. 6in., with sliding doors in front. The corn and hay-shoot and ladder are placed between the loose box and stalls, in a good position behind the horses, a cupboard is fitted under the stable window, the harness-room is also fitted with these necessities, and the author has not forgotten to provide a stove between the harness-room and coach-house—a requirement overlooked by many of the competitors. Ventilating windows are provided above the horses' heads, at the back of the stable. Externally the design is more satisfactory. Over the harness-room entrance is a timber gabled loft with door, and simplicity and characteristic detail mark the design. The author provides a useful covered shed for washing the carriages. No details of the stable fittings are given. The author of "Another for Hector" sends a good plan, in which the coach-house projects as a wing on the right-hand side; the harness-room is placed at the back of the coach-house, but no means of warming the coach-house is shown. The loose box is separated from the stalls by a wall, but has not a distinct outer entrance. The ladder and corn-shoot are placed between the stable and coach-house, forming the jamb of the doorway. In this respect, and the awkward communication between the harness-room and stable, at the back of carriages, the arrangement is defective. We object also to the position of the manure receptacle in the front. No fittings are indicated. Externally, the design is very pleasing. The walls are of stone rubble, and the roof of flag shingle. There are well-treated lights for iron casements, and the combined treatment of the coach-house doors, and the loft door over in the gable, is cleverly managed. "B. N." is a simple rectangular block, with the stable and loose box in one, entered at the side of a covered entrance, or washing porch. The loose box is rather small; it should generally be double the width of the stalls. The harness-room is in the right position, but no direct communication is provided between it and the stable—a defect noticeable in the two first designs. The author shows flat gratings over an inclosed gutter at the foot of stalls, the paving being laid with valley. The loft, or granary, extends over the whole building. This is not desirable; the door for admitting hay and corn is made a central gabled dormer above the entrance. The loft is mainly in the roof, which is well framed, with principals springing from the floor, the plate of the outer roof being tied to them. In the elevation the author tiles a portion of the wall under the eaves, and introduces ventilating tiles at the level of the stable ceiling. The

treatment of the exterior is picturesque, though we do not like the cambered timber lintel over entrance, and a little less affectation in the timbering would have been better.

"Sperabo" has a compact plan, the stalls and box being in one compartment, about 18ft. by 16ft., and 10ft. high, the loose box occupying the corner, and a 6ft. stall on each side (at right-angles), allowing an angular entrance between the two stall posts to the box. The harness-room is well placed in the centre, a corn-bin and hay-shoot being placed in front of it, with two doorways, one entering the stable and the other the coach-house. There is, however, no means of warming the coach-house, so essential to keep the stuffing and linings of the carriages dry. A loft is shown over the stable and harness-room, and a ventilating flue is carried up from the stable next the harness-room flue. We scarcely admire the broken and cut-up arrangement of the roof, with its two hips and dormer. Quadrant ventilators are shown, and hollow walls, and the drainage is indicated. The reveals of the openings are provided to be of bull-nosed bricks, a desirable point, and the stable to be paved with grooved stable bricks on 9in. of concrete. Design, with motto "St. Lucy," is too straggling; the loose box is made entirely distinct, and the groom would have to bring his horses out an unnecessary distance to the washing stall, while the harness-room is quite out of reach from the stables. We cannot understand why the author has placed his stalls lengthwise with the building. The hay-loft is over the harness-room and washing-stall. A well-designed elevation, with a ventilating flèche over stables, has been sacrificed to an ill-considered and uneconomical plan. "Eclipse" shows a plan with a common-sense arrangement. There is a lobby or washing entrance, but the position of the doorways is not convenient for horses. It is also unlighted; a harness-room opposite (inside) with the 2-stall stable and box on the right-hand, and a coach-house on the left. The fire-place of the harness-room is well placed for warming the coach-house, and the corn-bins and ladder are placed in the entrance lobby. Iron mangers and corner racks are shown, but no ventilation. A groom's bedroom and hay-loft of half timber is placed as a gabled structure over the harness-room and lobby, and the external treatment is suitable, though we object to the small windows and inadequate lighting. There should always be a window to a coach-house, and it should be well ventilated to ensure dryness. Iron casements are healthiest and best, as they are cleaner, and the ammoniacal gas and vapour of the stable do not permeate them like wooden sashes. "A. L. C." has a rather confused and broken plan, with a loose box forming a transeptal arrangement with the stable proper. The washing lobby is rather large, and the stable lighted through it. The harness-room is not conveniently arranged as regards its fire-place, and the central pier between the coach-house doors would be better omitted. The plan, in fact, is too full of breaks to be a desirable one. In elevation the design indicates a correct taste, and is well drawn. A centre air-shaft, with the turret over, is carried from the stable through the hay-loft. There was no need for three sheets of drawings, which are very carefully made. "J'Espere" has the most compact plan of any as regards area, but the positions of coach-house, which is too small, and the manure enclosure at the angle of stable and loose box, are not the best. The elevation is better. We also note that the trap doors for hay above the mangers are not desirable, as they tend to frighten restless horses. "A," in circle, has a fair plan arranged in the ordinary manner, showing ventilators above the stalls, but there is no washing space. The alteration is not so good, and a smaller loft would have been better. In a second class we put "Senlac's" plan, incomplete, and there are several omissions. The harness-room, with its external flue, is a mistake; why waste heat when it could be made so useful to the dryness of the coach-house? and its position, too, is not central enough. There is no washing lobby, no drains, or means of ventilation shown, and the hay-loft is unnecessarily large, while the coach-house is not wide enough for two carriages. The author attempts a Queen Anne elevation, which is perhaps the best part of the design.

"Self Help" places his harness-room at the back of coach-house, and his loose box is separately entered. No fittings are shown. The hay-shoot and clock gable do not add to the design. "Isola" has a better plan, but no harness-room is provided, and therefore the design is inadmissible. "Student's" plan shows a fair arrangement, but the coach-house is not the best proportioned; its entrance doors leave too much space on either side, and the harness-room is unnecessarily large. The elevations are too ornate for stables. "En Avant" has a good workable plan, though not original, with the harness-rooms, stalls, and loose box (latter too small) in one row, loft over, the coach-house being on one side, and the manure pit at the other end. Were it not for the too cottage-like exterior we should have placed the design higher. "E." has a fair plan, but there are too many whimsicalities in the elevation, such as the cut brackets to coach-house door, which would be likely to be knocked off. The drainage is the best part of design. "Sparken-hoe" has an L-shaped plan, but there is no proper harness-room; design poor. "Honesty" does not do justice to its motto; the entrance is too narrow, and there is no harness-room. "Omega," in circle, which came late, puts his loose box where the harness-room should be. The treatment in half timber is suitable, though perhaps scarcely stable-like enough.

A Font.

Our idea of a font is that it should be a basin architecturally treated, and not the base of a rostrum. Some of the designers for this subject have given us a pulpit, and others have lost sight of the primal idea. The Norman and Early Transitional examples of fonts are excellent types, which do not appear to have been made use of. The design which most nearly realises our conception of a font is that by "Début." It is a circular, spherically-shaped basin, relieved by simple surface ornament, resting on an octagon base, surrounded by small shafts, which terminate at the top in trefoiled heads. A plain flat base, or circular step, surrounds the basin. The mouldings are simple, and indicative of the use of the object. "Fleur-de-lis" is the next most carefully-drawn design. The bowl is octagonal externally, richly-pannelled with raised shields round the sides; the angles are taken down as mullions to the base, and support eight cinque-foil-cusped arches under the bowl. The octagonal base is seen under them, and the whole rests upon three octagon steps, too narrow to be of use. The weak point of this design is that the surrounding arcade conceals the intention, and the ornament is rather too florid for a parish church. As a pulpit, the design would have been admirable. "B," in a circle, is of a similar style, but the sides of octagon are made to diverge outwards at the top and the sides below. The bowl is hollowed, and the steps are wider than the last. The swags of oak foliage round the font look like festoons. The author proposes New England limestone as the material. The next best is "J'Espere." The bowl portion is made square externally, though somewhat larger than the square base, the faces being joined by a deep ogee cove. The base is relieved by angle shafts (engaged), the capitals of which are cleverly worked into the coving with leafage. The neck members are too fine, and the arched bowl heavy and unredeemable. Materials specified are: Steps blue Greenmoor; base, red Mansfield; shafts, red granite; bowl, Bath stone, and panels, red Mansfield. "Trefoil," in circle, shows a hexagonal-shaped bowl, pannelled on face, with poor foliage. The font rests on a circular shaft, which would have been reasonable enough if the author had not shown six unmeaning, broken-looking mullions as legs at the angles, which incline inwards at bottom. The effect is that of a font top-heavy, breaking its supports, and the detail is poor. Of a second order we place "Faire Raison," whose ideal is a cap and base joined by a short shaft. "Harry," in circle, has mistaken a pulpit for a font, with a basin deep enough for a copper; "Mentonniere," hackneyed; "W," in circle—why the shafts supporting the curved part of basin? "Spe et Labor," another pulpit with a pedestal tapering to the bottom like a pendant of fan tracery. What next?

"Ashlar"—why spend time in drawing such detail? To all these authors we say—"Think well of what is wanted, and how best to do it."

A Stack of Chimneys.

In this subject "Début" again leads. Two circular and one centre square flue, diagonally set, and conjoined form the stack, which is well treated in brick and stone, or terra-cotta—the author does not say which—the ornament being the elongated diamond pattern, with caps having the embattlement finish. A small alarum bell protrudes from the base of shaft under a corbelled canopy. Drawing is effective but scratchy. "Bee," in circle, sends a well-conceived chimney stack of four flues combined, with a belfry between. The design is severely treated, the octagon shafts being perfectly plain, with steep conical cappings, between which the steep roof of belfry finishes. Fire-clay pipes, with stone facings, and terra-cotta cappings, are adopted. "Mechlin" has four square flues, ranged in a row as one stack, but the brickwork externally is moulded to form four conjoined shafts, with a salient centre angle. The base is pleasingly treated, with crow steps, and the bell is introduced in a niche in the base. The caps are well relieved by four oversailing courses and necking. We think the cut panels in the base are too small to be effective. "St. Lucy" is a well-designed group of four separate octagonals in plan, and arranged in a square or in two ranks, springing from a flush base, which projects from wall. An ornamental bell-cote juts out from the side of base, which is treated as a gable, with terra-cotta panels. The style is essentially Gothic, and the details are well shown.

LIST OF SUBJECTS.—NO. XIII.

A. A design for a small villa, to contain two sitting-rooms and necessary offices, with three bedrooms and a bath-room. Cost not to exceed £500, at the rate of 6d. a foot cube, the measurement being taken from the footings to half-way up the roof. Plans, 2 elevations and section; $\frac{1}{4}$ in. scale. (This subject will be counted equal to two.)

B. A mahogany sofa and easy chair; a perspective sketch with details. Inch and $\frac{1}{4}$ full size.

C. A brick cornice for a building of three stories high; 3 designs in a sheet; $\frac{1}{4}$ full size.

RECEIVED.—Alf Avimey.

ARCHITECTURAL SCIENCE CLASS.

MODES OF HEATING BUILDINGS.

THE methods of warming buildings have been fairly stated by "S. M. E." in our published replies. Warming by hot water is less costly and more safe than steam; and the low pressure system is that generally adopted. The theory of the circulation of heated water is too well known to require explanation here. The motion is imparted by the difference in the densities of the respective columns of heated and cold water. Circulation is increased by vertical pipes, and the extent of the circulation depends also on the height of the ascending pipe from boiler. The main points are the boiler, the circulating pipes, and the supply cistern. Authorities give about 1ft. superficial of boiler surface to 50ft. of 4in. pipe, or 4ft. superficial of boiler surface exposed to the fire to about 200ft. length of 4in. piping; and 2 $\frac{1}{2}$ to 3ft. of flue surface is considered equal to 1ft. superficial of surface exposed to direct heat. Saddle-back and conical boilers are perhaps the most economical for houses. In fixing pipes of course allowance must be made for the expansion by heat, and those laid horizontally should be larger than the vertical pipes or vertical mains. The area of piping required will depend on the number of cubic feet to be warmed per minute, the loss by ventilation, glass windows, &c., in the building. Of course the air extracted by ventilation will be so much heat lost. If 4ft. be allowed to each person per minute, that quantity of heat will be lost to each individual, or he will lose so much heat as is equivalent to the difference between the inner and outer temperature. Tredgold in his "Treatise on Warming and Ventilation" lays down the rule as to loss of heat by glass:—Multiply the area of glass sur-

face by 1.5, and the product will be the cubic feet of air per minute cooled from the temperature of room to outer air. Each door wastes 11ft. cubic air per minute on an average. For expansion $\frac{1}{4}$ in. for every 10ft. of length should be allowed, and the pipes should be laid with an inclination to the boiler, so that the condensed steam be returned to it. The supply cistern, to hold about $\frac{1}{30}$ th of the whole quantity of water in the pipes and boiler, should have an expansion-box to allow for the escape of accumulated air, and should be fixed at the highest part of the system. The high temperature or pressure system of warming, introduced by Perkins, consists in a system of pipes of small diameter, hermetically closed after being filled with water. The pipes are usually about $\frac{1}{2}$ in. diameter in bore, and $\frac{1}{4}$ in. thick, and the temperature of the water is raised to 300 or 400°. The heating is effected by a coil of the pipe, about $\frac{1}{3}$ th of its total length, exposed to the fire. The expansion of the water is provided for by an expansion-pipe, about 2 $\frac{1}{2}$ in. diameter, which contains about 15 per cent. of the water, and fixed at the highest point. The water is thus used to fill the piping to the bottom of the expansion-pipe, which should have a safety valve to prevent bursting. The danger of the high-pressure system is the great heat given off to woodwork in its vicinity, and the risk of the water escaping, by which red-hot vapour is formed at high temperature. The pipes should be of the best iron, and tested to an internal pressure of 3,000lb. per square inch. Warming by steam is rarely used, except when waste steam can be employed. In these cases the advantage of steam is great, though there are certain risks attendant on its use to be guarded against. Of course the expansion of the pipes has to be allowed for, and the boiler, furnace, and other fittings require to be constructed by an engineer. "Atteave" calls attention to the importance of an equable temperature without over-heating the air. Warming by heated air by the ordinary means of hot-air stoves and grates is that generally introduced in small houses, and the systems of introducing and warming the air, whether through a basement chamber, or through chambers behind grates, or at the sides of stoves, as in the Galton stove, are too numerous to enter upon in this summary. The principle in all cases is the same—namely, the warming of the fresh air admitted, and its equal distribution in conjunction with a system of outlets; for hot air, like hot water, becomes rarified and ascends, and this principle has to be taken advantage of. Sometimes a combination of the air and hot-water systems becomes necessary in large buildings, and no one system can be regarded suitable for universal application. Students are referred to the works of Tredgold, Hood, and others.

LIMES AND CEMENTS.—PLASTERING.

Question 49, on the materials used by the plasterer, has been fairly answered by "T. N.," "A. L. B.," "J. S. A. M.," and "R. J." "T. N." refers to the various plastering mediums, such as "coarse stuff," "fine stuff," "gauged stuff," putty, "rough stucco," "trowelled stucco," "rough cast," &c. Coarse stuff is a name applied to the mortar having the addition of hair, to give it tenacity as a first coat. "T. N." says it is composed of about 30 per cent. lime, and 70 per cent. sand. Clean cow hair is usually employed, incorporated, as "A. L. B." says, by means of the drag. "Fine stuff" consists of almost pure lime, slacked with water, and afterwards so saturated as to bring it to the thickness of cream. The water is then drained off, and the stuff attains the consistence of putty; hair is mixed with it. Plasterer's putty is another name for the same kind of material. Chalk or fat limes are those employed by the plasterer as not being so liable to "blow," as the slacking of every particle of lime is necessary. Dorking lime is often preferred. The sand used should be fresh water or pit sand. There is nothing better than clean road drift, produced by the attrition of flints and gravel, for the under coats. "Gauged stuff" is a mixture of fine stuff with plaster of Paris, the proportion required of the latter being regulated according to the time for setting. If the work

is to set rapidly, a larger proportion is required, the usual proportion being about 5 to 1. Plaster of Paris is prepared from gypsum, and is a sulphate of lime, and there are two qualities of fineness; the setting or finishing coats of walls and ceilings, and the cornices and other enrichments are generally a mixture of fine stuff and this plaster, the fine quality being best for the latter purposes. There are other kinds of materials used, such as "rough stucco," a mixture of fine stuff and sharp clean sand, to give a granulated or rough appearance. For external work the lime should be hydraulic. "Trowelled" or "bastard" stucco is a like composition, but with clean sand, and finished with a finer face; "rough cast," formed of gravel or grit, mixed with hot fluid lime, and used for exterior walls. The cements known as Parian, Keen's, and Martin's, are all compositions in which plaster is the common ingredient, mixed with borax, alum, and other substances. None of our correspondents have entered into the chemical properties of limes and cements, nor shown what chemical affinities, if any, take place between slacked lime and the sand. There is no doubt that a molecular structure or crystallisation is formed, known as a silicate. Dr. Higgins, who wrote a valuable treatise on calcareous limes and cements in the latter part of the last century, enters into various theories. He shows that the difference between chalk lime and limestone, consists in the retention or expulsion of the carbonic acid gas in them. Portland and Roman cements have been pretty fully described, and their ingredients are too well known to require mention here. Portland admits of a larger proportion of sand, and, if good, weighs about 120lb. per bushel, but fineness and weight combined should be required. Unlike Roman cement it improves by time. The latter cement has quicker setting properties—hence it is useful for many purposes where time is not an element. The tensile strength of Roman cement immersed (7 days old) equals 90lb. per square inch, whereas Portland cement equals 270lb. at the same age, and with age the strength of the former is reduced, while the latter increases in strength. The replies to question 51, in both the classes, published last week, contain the leading facts known on the subject of cements, and we refer our correspondents to them. "A. L. B." refers more fully than others to papier-maché, scagliola, laths, &c. Referring to nails, cast and wrought iron are both used, but for fir laths galvanised or zinc nails are perhaps best to prevent oxidation and disfigurement of plastering and ceilings. The processes of plastering walls and ceilings (50) have been fully described by "R. J.," "A. L. B.," "T. N.," and "J. S. A. M." Some of the writers, however, do not refer to the *modus operandi* with sufficient care. "R. J.," whose reply came too late, gives the most complete explanation of preparing the ceilings and walls. Thus, in nailing laths to beams, he shows that fillets are necessary to receive the laths, so that the "key" may be preserved. In the commonest ceilings, two-coat work or "lath plaster and set" is employed; the surface of the first coat is scratched to form a key for the finishing coat. This last coat is a thin layer of lime putty, trowelled and then smoothed with a wet brush. Three-coat is used in good work; this is called "lath plaster floated and set." The first coat is technically called "pricking up," and the surface is scratched diagonally, after which the floating coat of fine stuff is laid on. To form a true plane for this coat screeds of plaster, about 6in. wide and at intervals of about 5ft., are formed and plumbed. When perfectly true the filling-in or bays between the screeds is proceeded with in fine stuff, and the surface gone over with a Derby float, and finished with a hand float. "A. L. B." rightly says all laths should be "butt-jointed" in order to get a level ceiling; lapping should not be permitted in good work. For walls we have the same processes, but named "render, float, and set." Passing to the advanced replies the same questions are considered. The two qualities of lime have been fairly answered by "S. M. E." and "Atteave." "S. M. E." draws the distinction between "rich" and poor or hydraulic limes. These properties depend on their purity or the degree of admix-

ture with foreign elements, the latter varying from 1 to 30 per cent. Pure carbonate of lime is found in the white rock or chalk, though even this is not perfectly pure. Such limes yield the most powder when slaked, or from twice to three times the original bulk, but they set slowly. Poor limes slake slowly with less increase in bulk, and depend less on the presence of air for setting. Their impurities consist of clay, silica, oxide of iron, &c., and on the quantity of the former ingredient depends their hydraulic properties. "Attneave" does not distinguish clearly enough between these qualities. The next question (50) has been concisely answered by the latter, who says "lime for plastering must be slaked several weeks before use by being run into bed through fine sieves; when ready for use it is mixed in the proportion of 3 of sand to 1 of lime." Rich limes require a greater quantity of sand than poor ones, however, and a great deal depends on the quality of lime and sand mixed together. For "coarse stuff" the lime is usually mixed with 1½ or twice its bulk of sand, with the addition of well-beaten hair. Colouring, whitening, and limewhiting are not described by any of our correspondents, though they are generally considered the plasterer's work.

PAINTING.

ELEMENTARY QUESTIONS.

53. What are the principal materials used by the painter? Describe the ingredients of colour.

56. Describe the processes of common painting wood and iron work.

57. In colouring walls, what precautions should be used?

ADVANCED QUESTIONS.

55. Explain the theory of colouring.

56. Describe the proper mode of painting wall surfaces.

57. What is the best paint for ironwork?

RECEIVED.—T. N., R. J., Attneave, J. S. A. M., Spero, Egbert, A. L. B., Wilhelmus.

CHIPS.

The foundation stone of a new Wesleyan chapel was laid at Kirkdale, Liverpool, last week. Messrs. Dyer, of Barrow, are the contractors for the structure, which will be of iron.

The disused burial-grounds of St. Pancras and St. Giles-in-the-Fields, which have been converted into a recreation ground, were opened last week.

The accident at Bath has been repeated—fortunately, without loss of life—at Saltash. Archaeologists who disembarked last year will remember the narrow wooden bridge connecting the landing-stage with the shore. A crowd of excursionists visiting the local regatta on Coronation Day were precipitated into the Tamar by the bridge breaking in two, but all were rescued alive.

A series of improvements in the interior of the Leeds Town Hall has just been completed under the direction of the borough engineer. The decoration of the Civil Court, which is a noticeable feature, is from the designs of Mr. Hall, an assistant in the borough engineer's office.

Mr. G. E. Thoms, engineer and surveyor to the Great Crosby Local Board, has been elected borough surveyor for Wolverhampton, at a salary of £500 per annum. There were fifty-two candidates.

Mr. William Gibson has been appointed assistant surveyor to the Withington Local Board, at a salary of £150 per annum. There were sixty-four applicants for the post.

The Manchester City Council has resolved not to sanction any expenditure upon the mural decorations of the new Town Hall until a report has been prepared showing the amount of expenditure already incurred in erecting and furnishing the building. Mr. Alderman Lamb said the ratepayers were anxious to know whether or not there was any truth in the report that the expenditure up to the present date amounted to nearly £1,000,000.

The best preservative against dry rot, says the *American Journal of Pharmacy*, is the following of Mr. Schwartz, by whose death the secret is revealed: 1 part oil of cassia, 1 part wood tar, and 1 part train oil; apply three coats on the reverse sides, and on the ends of planks, floors, &c. In all probability oil of cassia played the chief rôle as preservative.

The foundation stone of St. Paul's Mission School, Bedford, was laid on Wednesday afternoon by Mrs. Thos. Baruard, of Cople House, Bedford. The school contains a large room for lectures, service, &c., 62ft. by 28ft., and two class-rooms, each 20ft. by 12ft., with the usual lobby entrances, cloak-rooms, lavatories, &c. The contract, £1,030, was taken by Mr. S. Foster, of Kempston, by whom it is now being satisfactorily carried out. The architect is Mr. John Day, diocesan surveyor, Bedford.

Building Intelligence.

ABBOT'S BROMLEY.—The foundation stone of a new middle-class school for girls was laid at Abbot's Bromley two years ago, and the chapel was opened for Divine service on Tuesday week. Inside, the building is some 30ft. long, 20ft. wide, and 50ft. high to the apex of the roof. At present the fabric has a plain appearance, both externally and internally. The whole is built of local red brick specially made to a thickness of only 2in. By this dimension an effect is given to a small building which would not be produced by the use of the ordinary bricks. A similar thin brick is used in the mediæval churches of Belgium, as, for instance, at Bruges—and until modern times these thin bricks were most common in England. The altar is raised six steps above the body of the chapel, and the pavement of Godwin's tiles increases in richness of design as it advances eastwards. The ultimate intention is to line the walls of the sanctuary with stone and bands of alabaster, with a reredos in the centre bay consisting of three moulded arches, in which, carved in red stone, will be the Crucifixion with St. Mary and St. John. Flanking the reredos on the side walls will be figures of saints under projecting canopies—three on either side. The choir has been erected at a cost of about £800. The completion of the chapel by a nave 40ft. long will be proceeded with as soon as funds permit. The architect is Mr. Carpenter, of Regent-street, London, and the builders Messrs. Espley and Sons, of Stafford.

BIRMINGHAM.—The interior of the Birmingham Exchange, which has lately been enlarged, has been decorated by Mr. Joseph Seers, of that town. The style of decoration has been adapted to suit the architectural features of the room, the character being semi-natural foliated. The general groundwork of the walls and ceiling is light buff for the former and cream-colour for the latter. The decoration of the walls is divided from the floor by a skirting of deep chocolate, above which is a maroon dado, with the moulding relieved with gold, warm green, and black. Above this the walls are divided into arched panels, with broad pilasters. The panels are painted light-buff plain, while the pilasters bear considerable ornamentation. From the dado upwards there is on each pilaster—first, a broad band of deep warm green; next, a 12in. rose border, in dull red; then a diapering of small stem flowers on a light green ground; and then a finishing of semi-natural foliage of sunflower and lily. The remaining parts of the walls are painted light-buff, diapered with dull red flower, and there is a running frieze under the cornice. The ironwork of the roof is of cold grey, with the rivet-heads gilded; and the wood panelling cream-colour, with the joints lined out with vermilion. The mediæval iron pillars and foliated ironwork of the capitals and brackets are decorated with several colours. The centre pillar of each cluster is blue, and the smaller pillars round it warm brown. The bases are of maroon and deep blue, and the capitals cold grey, relieved in the principal parts with gilding and colour.

DERBY.—On Wednesday week the new buildings of the Derby School of Art were opened. The architects are Messrs. Waller and Son, of Gloucester. The building consists of two wings, having an open courtyard between, so arranged as to obtain a north light for all the drawing-rooms. The wings are united at the east and west ends by corridors, connected with all necessary offices, staircases, and entrances. The ground floor consists of a porch and entrance-hall in the centre of the building, facing Green-hill, opening on the front corridors, but shut off from them by means of an inner glass screen. Communicating with the front corridor on the north of the entrance are the principal stairs, ladies' elementary room, and a passage to the machine drawing-room and back corridor. On the south side of the entrance are the secretary's room, store-room, elementary-room, and cottage for curator, this latter being so placed that the curator may have easy access to the front door and all other parts of the building. The back corridor, in which is the male students' en-

trance, communicates on the north side with the machine drawing-room and passage in front corridor, &c., with the staircase to first floor for the use of male students, and with their lavatory, &c., on the south side, with the elementary and painting rooms. The wing containing elementary and painting rooms is only a one-story building. The construction of the roof of the antique and painting room is peculiar, and specially adapted for the admission of uninterrupted light, as it partakes of one great curve from the sills of the windows to the apex of the roof. The roof of these rooms, and the windows in it being carried on curved iron principals to allow of this form of construction being adopted, the result is that in all these windows all the advantages of the ordinary skylight and perpendicular side-light are obtained, without the great disadvantage of the block caused by the wall plate at the junction of the two. This form of construction has been adopted by Messrs. Waller and Son, in the School of Art at Gloucester, and has been found to answer extremely well, and to be of very great practical benefit to the school. The fronts towards Green-hill and Degge-street are of stone, but the rest, where not generally visible, is of brick. The cost of the present section, with land, architects' charges, &c., was originally estimated at about £7,000, but a sum considerably in excess of that amount has already been expended.

HANLEY.—The foundation stone of a new Conservative Club-house at Hanley was laid on Tuesday week. The building will be in the Classic style, and of stone. It will comprise, on the ground floor, four shops; on the basement, cellars, scullery, pantry, beer, wine, and coal-cellars to the club; on the first floor, assembly and reading-rooms; on the second floor two billiard-rooms, with lavatories, &c. The top floor of the tower will be used as a store-room. The architects, are Messrs. R. Scrivener and Sons, of Shelton; and the builder is Mr. Ellis, of Hanley. The entire cost of the club buildings, including the expense of furnishing, &c., is estimated at £6,000. The cost of the site was £2,000. The contract for the building has been let at £3,200.

HORSFORTH.—The foundation stone of a new church at Horsforth, near Leeds, was laid last week. The design has been furnished by Mr. J. L. Pearson, of London, and the contract is being executed by Messrs. B. Whitaker and Sons, builders, Horsforth. The style is Early Pointed. The plan comprises a nave, with north and south aisles. The nave arcades are in five bays, and opening from the two eastern bays a second aisle extends northward, and is gabled transept-wise in two gables. The nave is 88ft. long and 24ft. wide; the total width of nave and aisles is 55ft., and the additional aisles 12ft. 3in. more. The chancel is 41ft. by 22ft. 6in. Opening out from the chancel, by a lofty arch on the south side, is the tower, 14ft. square internally. On the opposite side of the chancel there is an aisle 16ft. 6in. by 17ft., gabled towards the north, and east of this a vestry 21ft. by 17ft. The tower is about 90ft. high, and is surmounted by a pyramidal spire. The walls will be built of grit stone in courses, the dressings will be of similar stone, and the roof will be tiled. The interior will depend for its effect considerably upon its height. The walls will be either plastered or faced with stone in courses.

NEW WESLEYAN CHAPEL, OXFORD.—The memorial stones of a new Wesleyan chapel, to be erected in the city of Oxford, were laid on Thursday, the 28th ultimo. The site has been carefully selected with a view to an imposing structure. The front elevation, including a tower and spire, 130ft. in height, will be visible from Cornmarket-street. The new building will accommodate 850 persons, and the design, which is of elaborate Decorated Gothic, is rendered very effective in the interior by the use of polished granite columns to support the stone arches of arcade. The contract has been undertaken by Messrs. Lynn and Co., at £6,500; and the architect is Mr. Chas. Bell, A.R.I.B.A., of 4, Union-court, Old Broad-street, London.

READING.—The new Congregational Church of St. Augustine, Reading, was opened for public worship on Wednesday. The church, the total cost of which exceeds £3,000, has been

built by Mr. S. Elliott, of Newbury, from designs by Messrs. W. and J. T. Brown, and F. W. Albury, Reading. It is in the Early English style. The material used is red brick, with dressings of Bath stone, the interior walls being of wrought brickwork, relieved by stone bands. The side walls have internal pier buttresses, supporting arches which form wall arcades of six spans on each side. The height of the apex to the central gable is 60ft. There is a gallery at the north end, including which the church will seat 700 persons; while, if necessary, side galleries can easily be added to accommodate 300 more.

STARCROSS.—The new Western Counties Idiot Asylum, at Starcross, near Exeter, was opened a fortnight since. The Early English style of architecture has been adopted. The external walls are of grey limestone, relieved with dressings of buff bricks and Bath stone. The general arrangement of the main building is somewhat in the form of the letter E; the level of the ground floor being raised some feet above the ground, thus providing ample cellars, &c., in the basement story. The central block forms a residence for the superintendent. The northern wing is appropriated to the boys, and the southern to the girls. The building at present will accommodate eighty children, but provision has been made for further extension if necessary. The cost has been from about £8,000 to £9,000. A portion of the old asylum building has been retained as a sanatorium. The architect is Mr. J. W. Rowell, of Newton Abbot and Torquay; the contractors, Messrs. Towill and Coles, of Starcross; and Mr. Thomas Gale, of Exeter, has acted as clerk of the works.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. Price Twopence. Annual subscription, post-free eleven shillings. The number published July 6 contains articles on Vaccination, Riparian Rights and Customs, Home Hospitals for the Well-to-do, On the Exclusion of Sewer Air from Houses, The Society of Medical Officers of Health and the New Public Health Bill, Dr. Duffield on the Same, Knowledge the Best Remedy for Intemperance, The Society for Improving the Dwellings of the Working Classes, The Forthcoming Domestic Economy Congress at Birmingham, Public Health Reports, Parliamentary Notes, Correspondence, Water Supply, Sanitary Novelties, Intercommunication, The Editor's Table, Public Health Patents, Gleanings, &c. E. J. KIBBLEWHITE, 31, Tavistock-street, Covent-garden, W.C. And all News-vendors.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements is. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

BUILDER. (We consider you have good grounds for compensation for time and labour in sending in a tender.)

Correspondence.

MR. LONG'S "EGYPTIAN FEAST" AT THE ROYAL ACADEMY.

To the Editor of the BUILDING NEWS.

SIR,—“M.” is confusing himself and others by throwing dust in their eyes. The question simply was, whether Mr. Long’s interior is right or wrong. “M.” declared it wrong. He asked “where the light came from,” and said, “there appear to be no windows.” I showed in my reply that Mr. Long’s interior was not impossible, and could have been lighted without windows, pointing out that the artist had represented one of the palace halls such as we find at Karnac, Thebes, and other parts, in which the light was admitted from above. Under the Ptolemies the temples were similarly planned, with open courts, the glare of the sun being kept off by awnings, while the darker cells were lighted by slits or openings at the top. “M.” says I have invented the idea of awnings. Lethim consult Viollet-le-Duc and other writers on the subject. He then says I seem incredulous about windows, thus shifting his position. The point was not whether there were windows, but whether Mr. Long had shown a mode of lighting that was impossible. I contend that the artist is perfectly justified in showing a windowless apartment for his feast. “M.” has adduced some examples to show that his preconceived idea of windows is tenable; but they only prove the rule, and they certainly do not prove Mr. Long’s picture to be wrong. “M.” then asks, “Has the critic ever read Herodotus?” If “M.” had, he would have never raised the doubt he has. Who said that the historian says anything about lighting banquetting-halls? The idea emanates from “M.’s” brain. It is scarcely necessary to say more. By the way, “M.” makes no further allusion to the feast and the viands. Perhaps Herodotus has set him right here. It is not my desire to defend Mr. Long, who, I dare say, is well able to take care of himself. All I desire is the truth.—I am, &c.,

THE WRITER OF THE ARTICLE.

[We cannot afford any more room for this discussion.—ED.]

AN UNFAIR COMPETITION.

SIR,—In the competition for Hindley Cemetery, recently decided, the surveyor to the board, to whom the competing architects had to apply, and by whom particulars were furnished, was allowed to submit designs. They were selected, and the first prize awarded for them.

Will you express your opinion as to the fairness or otherwise of this course?

The board maintain that they had a perfect right to receive and select his plans.

I, and other competitors, contend that any one connected officially with the board was debarred in honour, if not in law, from competing.—I am, &c.,

R. KNILL FREEMAN.

Bolton-le-Moors and Derby, July 4th.

[We consider such a competition supremely unfair.—ED. B. N.]

COMPETITIONS.

SIR,—I have to beg permission to ask, in your columns, for information as to the results of two recent competitions—namely, those for cemeteries at Reddish (near Stockport), and at Hindley (near Wigan). The former was promoted by a joint-stock company; the judgment was long delayed; and my drawings were returned ultimately with carriage and thanks alike unpaid (both of which I obtained subsequently); and with the information that certain designs had been retained for “further consideration.” As a matter of curiosity, I should like to learn whether that “consideration” has yet fructified into a decision. It will be well for competitors, in dealing with joint-stock companies, to learn, before embarking their time on a hazardous speculation, in what state the company exists; as their labour and learning may otherwise form a gratuitous portion of the machinery by which the company is “floated;” and may fail of any chance of remuneration if the “floating” fail. This forms only another rock ahead in the career of the profession.

At Hindley the business was conducted with perfect courtesy, but the result was not communicated, nor has it up to the present time been published. Can any of your readers inform the profession on these points, and oblige, amongst others,

July 3, 1877.

A COMPETITOR.

[“A Competitor” will see by Mr. R. K. Freeman’s letter in to-day’s issue of the BUILDING NEWS that the Hindley Cemetery competition has been decided in a way that reflects anything but credit on the committee.—ED. B. N.]

The foundation stone of St. Peter’s Church, Allerton, was laid on Friday. The church, designed by Messrs. Petersen and Thompson, Bradford, 84ft. long, 25ft. wide, will seat 320 persons, and the cost is estimated at £2,500.

Intercommunication.

QUESTIONS.

[5058].—Keen’s Cement.—Will some reader of the BUILDING NEWS kindly inform me how to use Keen’s cement to make a good job? I have some window reveals to do, and am not acquainted with it. Should the walls be scratched on, and the laths (with lime) before it is put on? And how should it finish with the other walls?—COUNTRY PLASTERER.

REPLIES.

[5054].—Fences.—Neither you nor your neighbours are bound in law to fence your lands, so that there is no legal liability on your part to maintain any of the fences. If you are under contract by lease to maintain and repair fences, you must ascertain the boundary of the land leased to you, and are then only bound to keep in repair such fences as are on the said land unless there are express covenants as to party fences to be kept in repair at joint expense. As to ownership of fences, the presumption, in absence of better evidence, is, that the fence belongs to the land on that side of it on which the posts are fixed, so that in fixing the outer boards or pales the points of the nails are towards the land to which it belongs, the fair sides of the fence facing the neighbour’s land. Were a fence otherwise fixed, the owner would lose the use of a strip of land as wide as the thickness of the posts.—L.

LEGAL INTELLIGENCE.

LUBBROOK v. BARRETT.—Architect fraudulently withholding certificate—Collusion with builder’s employer—Demurrer.—An action will lie by a builder against an architect, who, fraudulently and in collusion with the builder’s employer, refuses to certify that he is satisfied with the work done, whereby the builder is unable to obtain payment, if the architect has an interest in the contract between the builder and his employer.—This was a demurrer to a statement of claim in the Common Pleas Division. The statement of claim was as follows:—
1. The plaintiff is a painter and decorator, of No. 11, Norris-street, Haymarket. 2. The defendant is an architect and surveyor, carrying on business at 4, Dowgate-hill, London, E. 3. The defendant was employed by one Alexander Ridgway, for reward and commission in that behalf, to negotiate and effect a contract for the repair of certain premises known as 30, St. Martin’s-street, St. Martin’s-in-the-Fields. 4. And the defendant, with a view to earning the said commission, induced the plaintiff to make, and the plaintiff did make to the defendant a certain tender for the repairs above-mentioned, which, as far as is material, is in the words and figures following:—“11, Norris-street, Haymarket, 18th March, 1875. To Mr. W. Barrett, 4, Dowgate-hill, City. Sir,—I hereby agree to perform all the works at No. 30, St. Martin’s-lane, for Col. Ridgway, according to the specification or schedule prepared by Mr. Waghorn, to his and your satisfaction, for the sum of £120. And I also agree to perform, without any additional charge, all other repairs and restorations that may be necessary to these premises, or that may be fairly construed as a dilapidation, although not particularly described. The restorations in the basements are to correspond in every respect with the basement of No. 31 adjoining, except the copper and cistern which are now in the yard, and the range; which are not included in this contract, but the chimney breast is to be properly altered ready to receive it. The whole of the works to be done in a good, sound, workmanlike manner, and the whole of the premises to be left in a clean and tenantable condition, fit for occupation, and to be completely finished in every respect on or before the 30th day of April next—CHARLES LUBBROOK.” 5. And the defendant accepted the said tender, and agreed with the plaintiff that as soon as the work was done as therein specified, in a sound and workmanlike manner, he would signify his satisfaction in an adequate and sufficient manner to enable the plaintiff to recover the price thereof from the said Alexander Ridgway. 6. The plaintiff duly executed the said work in accordance with the specification referred to, in a good, sound, workmanlike manner, and to the satisfaction of the said Mr. Waghorn, and duly carried out all the clauses of the said contract, save such as the performance of the same was waived by the said Alexander Ridgway and the defendant, and the plaintiff altered and amended all such things as were pointed out by the defendant as not being to his satisfaction, as far as the nature and age of the house (the subject-matter of the contract) would admit of, and all conditions were fulfilled, save those as aforesaid waived, and all things had happened and were done to entitle the plaintiff to have the defendant give such sufficient certificate or other intimation of his satisfaction to enable the plaintiff to recover from the said Alexander Ridgway the agreed price; yet the defendant, although he admitted to the plaintiff, and to the plaintiff’s solicitor, that he was satisfied with the work, falsely contriving, and in collusion

with the said Alexander Ridgway, and by his procurement and for fear of forfeiting the further customs and rewards of the said Alexander Ridgway, and in fraud of the plaintiff, and contrary to the true intent and meaning of the said contract, neglected and refused to admit or certify that he was satisfied with the work, but on the contrary falsely pretended that he was dissatisfied with the same, and that it was not done in a workmanlike manner.

7. By reason of the premises, the said Alexander Ridgway refused to pay to the plaintiff the whole of the agreed price justly due to him on the said contract, and through the wrongful acts of the defendant above-mentioned, the plaintiff was unable to recover from the said Alexander Ridgway more than what the said Alexander Ridgway chose to pay, which was a sum less than the balance justly due, and the plaintiff accordingly lost the balance thereof, to which he would have been otherwise entitled, and the said balance still remains wholly due and unpaid to the plaintiff. The plaintiff claims £100 damages.—Clarke, for the demurrer.—The demurrer raises the question whether an action will lie by a builder against an architect, who has been employed, and whose certificate has been rendered necessary before payment of the builder for the work done, for refusing to give his certificate. *Batterbury v. Vyse* (2 H. & C. 42) decides that the employer is liable to the builder where there is fraud and collusion between him and the architect, which prevents the latter from giving his certificate. Therefore, this action should have been brought against the employer. There is no allegation here that the architect was in fact satisfied. Grove, J.: How is that material when fraud and collusion are alleged?—There is no contract with the architect. Grove, J.: This is not in contract, but in tort.—It is not shown by this statement that he has been defeated in recovering the amount from Alexander Ridgway, the person he contracted with. Grove, J.: The claim alleges that he was unable to obtain payment.—There is no precedent for such an action as this.—Woodward, in support of the claim: *Batterbury v. Vyse*, cited on the other side, is really an authority in favour of this action. In *Lumley v. Gye* (2 E. & B. 216), maliciously inducing a person to break a contract, was held to form such a conjunction of wrong and damage as constitutes a ground of action. In *Com. Dig. v. Action on the Case*, it is laid down that wherever damage is done through the wrongful act of another, an action on the case will lie. *Pasley v. Freeman* (3 T. R. 51) is to the same effect, and is a leading case on the subject. Therefore, there is here a legal cause of action. I particularly inserted in the claim that it was done with fraud and collusion, so as to keep well within the cases. In *Pasley v. Freeman*, and *Lumley v. Gye*, the same argument that the action was a new one was urged; but the judges said that there being no legal objection to it in principle, the fact that there was no precedent for the particular action made no difference.—Clarke, in reply: There can be here no damage through the defendant's act, because the plaintiff has not lost his right of action against his employer, which *Batterbury v. Vyse* shows that he possesses.—Grove J., after referring to the statement of claim and the arguments of counsel, proceeded: One might have expected that an action of this sort would have been brought before; but it appears not to have been so. There can be no doubt that an action will lie by the builder against his employer, when the architect's certificate is fraudulently withheld by collusion between the architect and the employer. *Batterbury v. Vyse* has decided that. I can see no reason why it should not lie against the other party to the fraud. Can it be said that an action would not lie jointly against the two persons in collusion to withhold the certificate? It has been argued that there is no necessary damage here. I should say that where there was a breach of contract occasioned by the tortious act of another, an action would lie without special damage. But it is not necessary to decide that now, because here there is special damage alleged. Neither is it necessary to decide whether this action would lie against a stranger to the contract; because here there are averments showing that the defendant had an interest as to earning his commission, and was cognisant of the agreement between the parties. Here there is every element requisite to constitute a legal cause of action. I am of opinion, without any doubt, except such doubt as must always arise in cases *prima impressionis*, that the statement of claim discloses a perfectly good cause of action; and that this demurrer must therefore be overruled.—Demurrer overruled with costs.

THE CHARGES FOR PLANS OF BUILDINGS.—Mr. Samuel Clarke, builder, of Plymouth, for whom Mr. Charles Rodda appeared, sued at the Stonehouse County Court Mr. Henry Matthews, confectioner, of Plymouth to recover £7 10s. for work done. Mr. T. C. Brian appeared for the defendant.—The claim was for making two sets of plans for the erection of stables in Higher-lane, and preparing an approximate estimate for the same, for which

1½ per cent. would be an architect's charge, and this, on two sets of plans, at an estimated cost of £350 each for the buildings, would make ten guineas.—Mr. J. H. Keats, architect, of Plymouth, was sworn by the plaintiff's solicitor, but he asserted that three guineas were enough for the work done, on the ground that the plans were not completed.—Mr. J. L. Hodge, surveyor to the Stonehouse Local Board, and Mr. John Hicks, a member of the Plymouth Town Council, swore that the charges were fair.—The Judge, without calling upon Mr. Brian to examine witnesses, considered that three guineas were sufficient for the plans, and gave a verdict for that amount, which, Mr. Brian stated, had been paid into court.

CONCRETE BLOCKS IN WALLS.—Thames Police-court.—The District Surveyor of Bromley-by-Bow, Middlesex, summoned Mr. Harris, a builder, before Mr. De Rutzen, at the above court, for partially constructing the walls of three houses with concrete blocks, without having obtained the special sanction of the Metropolitan Board of Works. The solicitor who appeared for the defendant contended—first, that the concrete used by his client was a "hard and incombustible substance" within the meaning of the Building Act; and, second, that the Metropolitan Board of Works had no power to grant licenses or to enforce rules for the composition of concrete. The district surveyor proved the use of concrete in the partial construction of the walls, as alleged in the summons, and the chief clerk of the superintending architect's department of the Board of Works stated that no application had been received from the defendant for a license to use concrete in the construction of the walls of his houses. A sample of the concrete used by the defendant was produced in court, and both these witnesses stated it was of a friable nature, and very inferior to that which would have been made had the rules incorporated in the licenses granted by the board been properly observed. Two surveyors were called for the defence, and although one of them admitted that the concrete used by the defendant was "rather brittle," they both concurred in the opinion that it was a suitable material for the walls of small houses, and as it was "hard and incombustible" it appeared to them to literally fulfil the requirements of the Building Act. A Mr. Wicks (builder) was called, and stated that some years ago he built several houses in Poplar entirely of concrete of a description very inferior to that used by the defendant, but no objection was made to its being used. The magistrate, having taken time to consider the matter, delivered judgment on Monday last to the following effect:—"I do not intend to discuss the question as to whether the concrete used by the defendant is a 'hard and incombustible material' within the meaning of the Building Act, but I purpose confining myself to the issue raised by the district surveyor, which is simply—Is a person who desires to build the walls of a building with concrete obliged to obtain the special sanction of the Metropolitan Board of Works for the use of such material? On referring to the first schedule preliminary of the Building Act, I find it laid down in the second rule that every wall shall be 'properly bonded,' and I hold that this is not applicable to a concrete wall, and I am of opinion that buildings constructed of concrete are buildings to which the rules of the Building Act are inapplicable, and that, therefore, the special sanction of the Metropolitan Board of Works to the erection of such buildings must be obtained in accordance with the third rule miscellaneous, first schedule preliminary, of the Building Act. It appears to me most essential that proper control should be exercised over the composition of concrete intended to be used for walls of buildings, otherwise friable, and therefore unfit, material might be used for that purpose under the name of concrete, and there would be danger of such buildings falling. In the present case it appears that only a small portion of the walls have been built in concrete. I do not therefore, propose to make an order to pull them down unless the Metropolitan Board of Works consider it necessary." The district surveyor has reported the decision of the magistrate to the Metropolitan Board of Works, whose decision is that no further action is to be taken.

MR. SWINDLEHURST AND HIS "MIDDLE MAN" ARRESTED FOR CONSPIRACY TO DEFRAUD.—On Tuesday, at Bow-street, Edward Saffery, estate agent, and William Swindlehurst, secretary and manager of the Artisans, Labourers, and General Dwellings Company, were brought before Mr. Vaughan, on a warrant, charged with having conspired to defraud the shareholders of the sum of £60,000. Mr. Douglas Straight, who conducted the prosecution, said that these proceedings had been taken at the instance of a committee appointed by the shareholders to investigate the affairs of the company, which, up to a certain time, had been apparently carried on with a fair amount of prosperity. The matter was placed in the hands of Mr. John Morris, of the firm of Ashurst and Morris, who, after full investigation, arrived at the conclusion that the defendants, by a process of combination, which, after discovery, seemed simple enough, had appropriated large sums of money constituting the difference between the sums actually

received by them and paid on behalf of the company for the purchase of certain estates. Up to the present time Mr. Swindlehurst had enjoyed the full confidence of the shareholders, and when the committee of investigation was appointed, he expressed his desire to supply every information in his power as to the affairs of the company; but on Saturday last he suddenly withdrew from the post which he had occupied, absented himself from the office, and was apparently intending to abscond altogether. The learned counsel referred to the defendant Saffery as the "middle-man" in the transactions between the company, as represented by Swindlehurst, and the original vendors of the property, and mentioned, as examples of the same, that the Shaftesbury-park Estate was sold to the company, apparently, for £28,000, whereas the sum actually paid to the vendor was only £25,000; another property, called the Cann Hall, near Epping Forest, was represented as having been acquired by the company for £48,000, although only £35,000 was paid for the same; the Queen's-park Estate, sold for £17,000 was charged to the company at £57,000. The complicity of the two defendants in these transactions would be amply proved, and bank-notes received by one defendant had been traced to the possession of the other in the course of the investigations. After referring to the sections of the Larceny Act, under which the warrants were obtained, Mr. Straight said he was prepared to go into the case only so far that a remand might be granted. The Hon. Evelyn Ashley, M.P., deposed that he was a shareholder of the company, of which Dr. Baxter Langley was the chairman and Mr. Walton the deputy-chairman. The defendant Swindlehurst was, until Saturday last, the secretary and manager of the company. At a special meeting of the shareholders a committee of investigation was appointed to examine the accounts of the company. Mr. S. Morley, M.P., Mr. W. H. Stone, Mr. Mocatta, Mr. Kempster, Mr. Ernest Noel, Mr. Cutler, witness, and others were members of that committee, witness being appointed chairman. They commenced an inquiry at the offices of the company in Great George-street, Westminster, and after several meetings placed the matter in the hands of Mr. John Morris, Mr. Edwin Waterhouse, accountant, being also employed to assist. They inquired into the purchase of the Shaftesbury-park, Cann-hall, and Queen's-park estates, which purchases were made between 1872 and 1874. Witness gave the details of these purchases, as stated in the opening of Mr. Straight, and showed that the amount paid was about £37,000 less than the sums charged to the company. The defendant, Saffery, acted in each case as "middle man." Witness knew nothing of Saffery, but had heard that he lived at Cookham, and had offices in Essex-street, Strand. The defendant, Saffery, wished to know what was meant by the term "middle-man" as applied to him: Witness explained that the man who stood between the owner and the purchaser of a property and made a profit out of the sale was a "middle man." Mr. Vaughan advised the defendant, who was not represented by counsel, to defer his cross-examination for the present, especially as the evidence so far had hardly affected him. Mr. John Morris was examined to show the connection of Saffery with the purchase of the three estates in question. He did not deny this fact, but said the money did not pass through his hands. Witness had communicated with the solicitors representing the owners of the estates and the company's solicitors, and found the amount of purchase-money accurately stated. The difference between the vendors' charges and the sum charged to the company was also accurately stated, and the defendant, Saffery, said it was only a fair profit on the transactions to be derived by the intermediate vendor. In answer to the defendant, witness stated that Saffery attended very promptly when required to give an explanation of his share in the business. The case was remanded, bail being accepted for both defendants—two sureties, in £500 each, besides personal recognisances in £1,000 each—with the usual notice.

CHRISTIE v. MITCHISON.—Demurrer—Party walls—Contribution to expense of—Use and benefit of by defendant.—A statement of claim in substance alleged that the plaintiff purchased a building site of one J. in Crown-street, Newcastle, and covenanted to erect thereon houses according to a certain specification. The specification, in providing for the erection of a party wall, declared that the purchaser first building a party wall was to be repaid by the purchaser of the adjoining site one-half of the cost of such party wall, the value of the same to be determined by the vendor's architect. The statement of claim further alleged that the plaintiff erected a party wall, and that the defendant afterwards became possessed of an adjoining site on the terms that he should build in accordance with a similar specification, and should observe, perform, and abide by all the terms of the said specification relating to the party wall: that the defendant built a house on the adjoining site, and made use of a moiety of the party wall erected by the plaintiff, and promised to pay the plaintiff one-half of the value of the same (which had been ascertained by the vendor's architect), and one-half of the architect's fee, but had not paid the same. Held, on demurrer, that the statement of claim was good, the defendant having made use of the party wall, knowing that money was to be paid to some one for use hereof, and having afterwards promised to pay plaintiff.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 13, 1877.

THE SCIENCE OF ÆSTHETICS.

IT will be a new doctrine to many to be told that the states of mind—we use the term advisedly—arising from the contemplation of a work of fine art, such as a musical composition, a fine painting, or a work of architecture, have a physical origin, and are related to our nervous organisation. There are many people who will probably laugh at the idea that their enjoyment of Mozart or a Raphael—a simple melody or a pleasing chimney-piece—is connected with their vital functions. To the artist who believes in the transcendental origin of his art, the notion will be still more repugnant, for he now regards his genius for art in the light of a Parnassian inspiration—something that is akin to the supernatural—more exalted than anything human. But to our minds a scientific explanation of the phenomena of our sensations or emotions, does not rob art one iota of its high ends and purposes. It rather, we think, tends to give it a solid basis of reality—something beyond mere whims and fantasies. It is rather early in the day to broach the subject; for it is a lamentable fact to admit that there is scarcely one artist in a hundred who knows or cares to know anything of science beyond the bare wants and literature of his own art. Even a contemporary falls into absurd mistakes in dealing with the theory we are about to describe. The writer seems to think that, because we have dispensed so long with such knowledge as this “new” æsthetic revelation has given us—that because the author of Salisbury spire was ignorant of the deductions of the physiologist—it is vain to unlearn the time-honoured doctrine. What doctrine? Then another mistake is to confound our knowledge of physiological facts with æsthetic progress. What writer on this subject has ever declared that our artistic progress must necessarily be measured by our physiological? Such ideas as these arise from a confusion of the objective with the subjective states of mind, and we dismiss them for what they are worth.

Mr. Grant Allen, in a new work on “Physiological Æsthetics,” has given us a clear exposition of the theories of our greatest modern psychologists on the subject of æsthetics, and as we have read the work with some attention, we shall endeavour to give our readers some notion of the advanced views entertained on this branch of psychological science. The theory broached is not altogether new, as it really is a development in one direction of the “evolution” theory now generally admitted by some of our greatest minds—Darwin, Herbert, Spencer, and others. We need scarcely say some very ludicrous mistakes are entertained of the hypotheses of the former writer, while the works of the latter are too profound and comprehensive to have been garbled to the same extent. Some time ago we attempted to place before the readers of the BUILDING NEWS some deductions upon the subject of æsthetic laws, when one architect actually asked the meaning of the term “positivism,” and who Comte was? This admitted ignorance is even less excusable now. Mr. Allen Grant’s work only attempts to prove, in regard to our æsthetic feelings, what all modern physiologists have proved with reference to our sensations generally, and in so far he is simply extending a general law previously referred to in these pages. Æsthetic feelings are shown to be constant subjective counterparts of definite nervous

states. In this brief sentence we have the sum and substance of Mr. Allen’s essay, and before writers try to demolish they at least ought to explain. We do not assert that this proposition has been so elaborately worked out and demonstrated as it is possible to be, but we consider the opponents of the theory should first prove it wrong, or adduce facts to verify their own hypotheses. Till they do this they are only “begging the question,” and we must be content to follow our own inductions from facts. Burke, in his “Essay on the Sublime and Beautiful” has tried to show that beautiful objects have a tendency to produce “an agreeable relaxation of the fibres,” and hence he says that smoothness and delicacy are qualities essential to beauty. Alison, in his well-known work on “Taste,” refers the emotion to association, and that it is something quite different from sense; Jeffrey, in the “Encyclopædia Britannica,” adopts the same theory; Dugald Stewart, in his “Philosophical Essays,” agrees with the notion that association determines our preferences in colour, form, and motion, but also maintains a primitive pleasure of colour and the intrinsic beauty of objects of sight; Hogarth, in his “Analysis,” takes account of certain elements in lines, such as fitness, variety, uniformity, simplicity, intricacy, and magnitude which produce beauty; while Ruskin discusses the subject in too transcendental and ideal a manner to understand, though he acknowledges the æsthetic character of the senses of sight and hearing. It will be observed these different views contain more or less of the truth, but they all reason from the individual consciousness, and take account of the external properties of beautiful objects, their reasoning being more deductive than inductive. Now, when we see a fine piece of architecture we know its external proportions, gradation of parts, lines, and forms, such as those mentioned by Hogarth, give us pleasure; while another building gives us pain, or produces a feeling of disgust, from precisely opposite properties. These are facts that we can assure ourselves of if we know anything at all about architecture; a feeling of disgust or dissatisfaction we know to arise from certain kinds of forms and contrasts, and an opposite feeling from opposite properties; but beyond this general inference we scarcely trouble ourselves about. How and why such and such proportions, lines, and combinations are more pleasing than others is a question belonging to the physiologist, who, from a generalised experience of sensations and the modes the nerve centres are affected, has deduced a general law that explains better than any previous theory our feelings on this subject. Mr. Grant Allen confesses frankly that he is not “an excessive devotee of fine art in any form,” but he adds:—“I count this a gain in attempting the psychological analysis of æsthetics, because, as Helmholtz well observes, the worshipper of art is liable to bring with him into the consideration of its simplest elements those enthusiastic feelings which are aroused in him by its highest developments.” We need hardly say this view is quite justified, though it is obvious to any artistic reader that the author has evinced, in speaking of architecture, painting, music, and the other arts, a decided feeling, as we shall have occasion to note. The treatise begins by explaining the simple pleasures in bright colour and rude imitations which have always delighted the child and the savage, and goes on to explain the more complex gratification and tastes of the present day. We have space here only to point out the leading positions as regards art, referring our readers to the treatise itself for further detail; and we shall try to divest it of unnecessary reference to organic structure. The general relation of

physical pleasure and pain to our organism is first pointed out, and this is so well established that we need not say anything of it. All know that pain is produced by dismemberment of bodily tissues in various ways. Pleasure is not so easily explained, but the teachings of recent authorities have almost proved the truth of the law* “that states of pleasure are concomitant with an increase, and states of pain with an abatement, of some or all of the vital functions.” Mr. Allen improves upon this, and says, “pleasure is the concomitant of the healthy action of any or all of the organs supplied with afferent cerebro-spinal nerves to an extent not exceeding the ordinary powers of reparation possessed by the system.” In other words, a pleasure is referable to an unimpeded action of the body, in which the circulating, respiratory, and digestive functions are at ease. No one in bad health can fully enjoy a fine piece of music or architecture, and every one will readily attest the truth that the strongest sensuous pleasures result from a harmonious exercise and stimulation of the nervous organs. But these have reference to the lowest pleasures, though upon them the author justifiably rests his superstructure of the more complex emotions known as æsthetic. We may as well premise that the writer nowhere leads us to infer that simple sensuous pleasures are allied to those produced by art, though those who reject the scientific explanation of æsthetics frequently throw this false charge against their opponents—perhaps more from ignorance than intention, however. Physical and emotional pleasures are well distinguished. Sight and hearing are regarded as the two higher senses, because they are so little connected with body-serving or vital functions; and hence æsthetic pleasure is defined to be “the subjective concomitant of the normal amount of activity, not directly connected with life-serving functions, in the peripheral eud organs of the cerebro-spinal nervous system.” The ultimate difference of the beautiful is “that which affords the maximum of stimulation with the minimum of fatigue or waste in processes not directly connected with vital functions.” Let us briefly refer to a few illustrative examples in support of this principle. Speaking of taste, the author anticipates the objection raised by some, who ask how we can account for different tastes in different individuals? And, again, it may be objected that if our perceptions of beauty have a physiological origin, they ought to be the same in all individuals. Now, it is easily shown that perceptions differ because nervous constitutions differ. For example, the vulgar, as Mr. Allen says, are pleased by great masses of bright colour—red, orange, purple, which give their nervous organisation pleasure, as affording the normal amount of stimulus; while the refined are more discriminative, and prefer delicate combinations of complementary to primitive hues. No instance, we think, can be brought to corroborate more the nervous origin of these perceptions than that of colour. In music we find the same thing. The untutored ear delights in a chorus rather than in one of Bach’s fugues, and classical compositions are invariably counted unenlivening and unmusical by those whose perceptions can only appreciate the comic song of the music-hall. Perceptions hence arise from the law of “natural selection,” the nervous centres of cultivated persons becoming more discriminative. We might go on multiplying examples to prove that the nicer shades and meanings in every kind of composition, from the lowest sensuous to the highest æsthetic, result from a differentiation of nervous susceptibilities. A man of vulgar or coarse taste generally goes from one extreme

* See Professor Bain’s work on The Emotions, &c.

to the other: he can seldom appreciate nice gradations and distinctions, like the man of cultivation, or the artist, and this fact forces itself upon us in every art, and even among literary men, in such a manner that we take it to be one of the greatest arguments in proof of this theory. It must be admitted, too, there is a great variety of tastes. Thus, there is always a larger proportion of inartistic than artistically-minded people; but there are artists, as the author observes justly, for every class of the public, and each knows what their public requires. These facts do not detract from the doctrine, but confirm the law that individuals differ according to their susceptibilities, or personal appreciation of that which calls up emotional and intellectual activities. Taste is regarded as the personal equation of aesthetics. Nor must it be imagined that an absolute aesthetic standard is impossible. On the contrary, says our author:—"It follows from what has been said, that bad taste is the concomitant of a coarse and indiscriminate nervous organisation, an untrained attention, a low emotional nature, and an imperfect intelligence; while good taste is the progressive product of progressing fineness and discrimination in the nerves, educated attention, high and noble emotional constitution, and increasing intellectual faculties." This opinion does not certainly do an injustice to the art-talent, while it certainly places it upon a more rational footing. The author goes on to observe that though it is impossible at our present state of development to set up a final and absolute standard of taste, "we are yet bound to accept as a relative and temporary standard the judgment of the finest nurtured and most discriminative" among us, who have paid the greatest attention to aesthetic perceptions. This doctrine is equivalent to another—viz., that we can educate our taste; and no one, we fancy, can gainsay this. In architecture, as in all kinds of decorative art, the public are continually being led onwards in their appreciation. Again, though there are artists for every class of the public, it does not follow that the public lead in taste. It is a fact that we cannot overlook among architects and artists generally, that "the highest who work up to the standard of their own taste usually gain little recognition during their life-time. But the taste which they have educated gains them at last a late or a posthumous recognition; while the little artist of the day passes away and is forgotten. The works of the highest art, like the works of the highest intellect, necessarily appeal to a very limited audience." It is clearly shown that the artist is one who has trained his nervous organism in such a manner that he can perceive every wave of pleasure or pain, every delicate thrill of harmony according to the hereditary structure given him.

We pass on to notice some of the phenomena which support these views. Speaking of harmony and discord of colour, the author observes what has been established by physicists, that "colour-harmony consists in such an arrangement of tints as will give the various portions of the retina stimulation in the least fatiguing order." Colour discord is the opposite. All tasteful combinations are produced in accordance with this formula: in fact, those colours give the most pleasure which call into play the opposite fibres, while those are the most disagreeable which stimulate the same class of nerves. The complementary colours are founded on this fact. If red be present, the eye—to find the agreeable balance—requires green; but if we juxtapose green and blue, orange and red, we produce the greatest fatigue of the nerves, and the most unpleasant result. As colour depends on the optic-nerve fibres differentially affected, form

depends on the number and relative position of them. We have only space to point out here one or two of the numerous exemplifications of this theory. Agreeable form is the perception produced by the most agreeable muscular actions of the eye in cognising adjacent points. All graceful lines and curves produce least fatigue, and harsh and perplexing forms the reverse; and although it is difficult to carry analysis on this subject very far, we are constrained to admit that to the optic nerves we must look for an explanation of these matters. These are questions, it is admitted, belonging entirely to the intellectual half of our nature, and the author fairly places the organ of sight as the first in the aesthetic hierarchy on this account. He shows hence that the higher arts are architecture, sculpture, and painting. We may another time refer to some of the special applications of the theory, and to the author's allusions to architecture. In the last it is shown that the intervention of the intellect (of numerous complex emotional factors) is concerned. A perfect architectural composition is thus the objective counterpart of those mental states which give us the greatest pleasure and stimulation, with the least amount of fatigue—while a vulgar piece of building or engineering is exactly the opposite.

EUROPEAN TIMBER.

THE real area, capable of producing valuable wood in Austro-Hungary, amounts to something above 9,270,000 hectares (about 19,000,000 of English acres.) This area is decreasing, though in some provinces it does so in a small proportion and gradually. On an average, 31 per cent. of the surface of the country has remained under the cultivation of trees, and in some of the provinces more than 50 per cent. of the whole surface is devoted to forests. Provided, however, that care is taken to replenish all the area of the forest in different gradations from the youngest to the oldest trees, it may be stated without exaggeration that an annual increase of 32,000,000 of "test cubic metres" (the official and usual measure) may be reckoned upon. This does not include the wood that may be made use of in the intervals of clearing, nor of the quantity of wood kept as stock or provision. The means for transporting timber are so insufficiently developed in Eastern Galicia, the Bukovina, and, owing to their inaccessibility, in the upper regions of the Alps, that the forests in these places have remained in all their pristine grandeur and luxuriance, and are still unavailable. The country produces pine, larch, fir, beech, oak, elm, willow, and poplar, and the export trade averages about 67,400,000 cubic metres decennially.

The forests of Hesse Darmstadt and Baden cover about 591,975 English acres, leaving only 162,145 acres for agrarian purposes. There are besides about 9,797 acres of wood belonging to Hesse in Prussian and Bavarian territories, which swell the total area of land covered by woods to 604,772 acres—in other words, four-fifths of the Grand Duchy is wooded. In Baden the forest-covered land occupies an area of 1,268,956 English acres, which is equivalent to one-third of the whole Grand Duchy. There is no appreciable decrease here, as every thirty years the land which has once belonged to the cultivation of trees, must return to its original employment. The forests contain some of the finest timber in Europe, and consist of pines, oaks, firs, &c. The various provinces of Prussia produce timber as follows:—

Province of Prussia.—Pine, larch, beech, oak, Norway maple, sycamore, elm, alder, birch, willow, linden, ash, and aspen. Pine wood comprises three-fourths of the total extent of forest in this province.

Province of Posen.—Pine, oak, birch, beech, alder, elm, maple, aspen, and hornbeam.

Province of Pomerania.—Pine, oak, birch, beech, alder, larch, elm, maple, hornbeam, aspen, linden, and hazel.

Province of Silesia.—Pine, pitch, fir, oak, alder, birch, and beech.

Province of Brandenburg.—Pine, oak, beech, birch, ash, elm, and maple.

Province of Saxony.—Alder, birch, oak, elm, maple, beech, hornbeam, hazel, yew, pine, and pitch fir.

Province of Westphalia.—Alder, beech, oak, elm, maple, birch, pine, ash, and larch.

Rhine Province.—Beech, oak, pine, larch, hornbeam, white alder, and pitch fir.

Hohenzollern.—Fir, pine, oak, aspen, birch, alder, willow, and beech.

Schleswig-Holstein.—Beech, oak, hornbeam, maple, poplar, hazel, pine, and larch.

Province of Hanover.—Beech, oak, pine, fur, larch, maple, ash, elm, hornbeam, birch, alder, and yew.

Province of Hesse-Nassau.—Beech, fir, oak, maple, elm, birch, aspen, willow, hazel, hornbeam, alder, larch, and yew. Respecting the recently annexed provinces of Alsace-Lorraine, we have no available statistics. Exclusive of these, the forest land covers 23 per cent. of the whole area of the kingdom. Seventy per cent. of the total annual produce of the entire country is hardwood, of which one-fifth is timber, and thirty per cent. firewood of stumps, roots, and brushwood. Probably in no country is greater care taken of forests than in Germany. Strict precautions are taken to prevent anywhere a greater area being cleared than is annually replanted. Most large forests are mapped out according to their size and the age and quality of the trees; a section being annually felled, and an equal area replanted. The timber trees of Saxony are similar to those of Prussia, and the whole forest area covers about 465,000 hectares. There is a general tendency to diminution arising from the forest land being constantly thrown into cultivation by small proprietors, and about one-third of the forests and woodlands belong to the State. Competent authorities give 1,000,000 cubic feet as the quantity cut in all Saxony every year, and the amount is not considered to be excessive. Wurtemberg may be generally divided into five distinct natural timber-producing districts, following the geological and climatic conditions of the kingdom. They consist of, 1, the pinewood districts of the Saxe Circle; 2, the hardwood district of the Unterland; 3, the pinewood district of the Black Forest; 4, the hardwood district of the Swabian All; 5, the pinewood district of Upper Swabia. In the pinewood districts the spruce and the silver fir largely predominate, although Scotch fir is to be found, chiefly on southern slopes, chiefly in conjunction with spruce, and sometimes separately. In the hardwood districts, the beech, interspersed more or less with oak, furnishes the bulk of the growth. Of other trees there are the small beech, ash, maple, elm, birch, alder, lime, and various kinds of willow. Wurtemberg has a superficial area of 4,819,675 English acres, of which 30.6 per cent. are forest lands. The area of timber-producing lands is rather on the increase than diminishing, and between 1861 to 1873 there was an increase of about 10,000 acres. As might be supposed, the State exercises a vigilant control over the forests, and neglects no opportunity of increasing its forest property by the purchase of contiguous lands, so that any general diminution arising from clearances elsewhere is more than counterbalanced.

As near as can be ascertained, the extent of timber-producing forests and lands in Sweden (exclusive of Lapland, which has never been surveyed), is 3,190 $\frac{1}{2}$ geographical square miles, or about 30,000,000 acres, being 42.8 per cent. of the whole area of the country. It can hardly be said that the actual area of timber-producing forests is diminishing to any great extent, since comparatively small quantities of forest land are being brought under cultivation. The same cannot, however, be said of its productive power, which is rapidly getting smaller. The red pine or Scotch fir, and the white or spruce fir, form the staple of the forests—the greater portion of which are situated in the northern and central provinces. They also produce oak, beech, birch, aspen, elm, and larch. The timber and deals exported to this country are of red and white pine. Birch only attains to a small size, and is chiefly used for firewood. Aspen is used for making matches, which industry is one of the most flourishing in the country.

Sweden exports her timber to almost every country in the world; perhaps China and Japan are the only exceptions. Great Britain consumes the most, and then comes France, Germany, Holland, Denmark, and Belgium. Very stringent forest laws are now enforced, the good effects of which cannot be seen before the lapse of some years, but there can be no doubt of their ultimately effecting a marked improvement in the yield of the forests.

The total area of forest-producing land in Norway is computed at 66,000 square kilometres, but in this survey considerable so-called timber-producing lands consist of comparatively unproductive rocks, swamps, and moors. The pine and the fir, even more than in Sweden, constitute the riches of the Norwegian forests. The Scotch fir is found up to the most northern latitudes, and grows there up to a height of 3,400ft. above the sea level. The spruce fir ceases near the Arctic circle. The forests are principally situated in the east of Norway, near Christiania, Hamar, Thronthjem, and Christiansand. Those of Bergen have long since been exhausted. In the western districts of the country forests can hardly be said to exist. As in Sweden, strict forest laws are now in force, but the mischief done by indiscriminate felling will take long to repair. In Messrs. Churchill and Sims' circular of the 5th June, they remark—"So few deals now come from Norway that there can be no longer said to be a trade in them." Battens and prepared floor boards form the principal export, and wood, 9in. wide or upwards, cannot be supplied as formerly.

The forests of Russia are, in several respects, an important feature of the country, as a physical characteristic, in a commercial point of view, and from supplying fuel in a country only recently found to possess coal. Estimating the surface of European Russia, says Mr. Schnitzler, at 402,100,552 dessiatens, 156,000,000 of this number are occupied by forests, 178,000,000 by uncultivated land, water, houses, and roads, 61,500,000 by arable, and a little more than 6,000,000 by meadow land. The forests, indeed, constitute a source of riches which may long continue inexhaustible, and which will be indefinitely increased by strict regulations for their economy and management. Seventy-six millions of dessiatens are still covered with pines, firs, and other cone-bearing trees, without counting the oaks, maples, beeches, poplars, and elms, which are by no means rare in the latitudes within the 52nd deg., and the birch which grows in still more northern regions. The governments of Novgorod and Tver, in particular, are studded with forests, and that of Volkonski, which extends to the Valdai Hills, is one of the largest known. In the government of Perm, out of 18,000,000 dessiatens, 17,000,000 are forest. Forest economy is now being more attended to, and young Russians are constantly sent to study forestry in the German and French colleges devoted to that science. The brushwood, covering a vast extent of forest land, consists almost entirely of the hazel, dwarf birch, alder, willow, and juniper. There are many conjectures as to the results to the timber trade, should unhappily any misunderstanding arise between England and Russia. Prices of Russian deals have already advanced; but, in all probability, any further serious rise would only drive builders to use cheaper wood, which, with the contracted building operations such a calamity as war might bring about, would make us more independent of Russian supplies than some are willing to admit.

Last week, Mr. Lascelles, of Bunhill-row, erected at Chelsea House, for the Earl Cadogan, a conservatory about 30ft. by 20ft., with a waggon-head roof of bend-wood ribs. The conservatory, which was designed to take the place of the usual tent, which is commonly put up at West-end mansions for dinner parties, was made, fixed, and painted, complete, within 7 days of the order being given. The work was done under the direction of Mr. W. Young, of Exeter Hall.

The competition for the new Vestry Hall, St. Mary Abbots, Kensington, still remains undecided, but we have received the assurance that "the committee will most likely report to the vestry at the next meeting, Wednesday, July 25."

ARCHITECTURAL SCIENCE CLASS.

ELEMENTARY REPLIES.

QUESTION 52.—Describe the meaning of "coarse stuff" and "fine stuff."—"Coarse stuff" is a rough mortar formed by mixing one or one and a half of sand to one of lime by measure, and about one pound of beast hair (which should be strong and free from grease and dirt), to every 3 or 4 superficial feet of mortar. Coarse stuff is put on the walls or ceilings to form the first coat, and is scored to form a key for the second coat. "Fine stuff" is pure lime slaked with a small quantity of water, and afterwards mixed to about the thickness of cream; the water is then allowed to evaporate until thick enough for use. A small quantity of white hair is sometimes mixed with it. It is used for the second or finishing coat, and should be applied when the coarse stuff is stiff.—R. J.

QUESTION 53.—In first rate work, what are the proper number of coats required for walls and ceilings?—Three—viz., 1st coat, coarse stuff; 2nd coat, fine stuff; 3rd coat, fine stuff mixed with a little hair if to be papered, or plasterer's putty mixed with sand if to be coloured.—WILHELMINUS.

QUESTION 54.—Describe the mode of finishing walls.—There are numerous ways of finishing walls, and the following are the principal:—1. For Paint.—Surfaces which are to be painted are finished with a coat of bastard stucco, consisting of 3rds fine stuff, and 3rd fine sharp sand. 2. For paper.—The finishing coat is a kind of inferior fine stuff or stucco, mixed with hair to form a firmer coat. 3. Coloured walls are properly washed with size before the application of the colour. 4. Cement walls.—In some positions it is advisable to have a cement finishing coat to form a hard surface. It is essential that the cement coat be grounded out with cement, as it will not properly adhere to plaster. It is finished with the trowel, and when a pure white surface is required for marbling, Parian cement is used. 5. Tile walls.—Tiles, or thin squares of marble, &c., are used as dados, and are set and jointed in pure cement.—T. N.

ADVANCED REPLIES.

QUESTION 52.—What is the best cement for internal walls left for decorations?—The Parian cement is the best for such purposes. It may be procured of two qualities, known as coarse and superfine. For an under coat the coarse quality may be used, with an equal quantity of fine sand, finishing with a thin coat of pure cement of the same quality on surfaces to be wholly covered with paint or paper; or with the superfine quality when to be tinted or polished. The superfine gives a pure white surface capable of taking a brilliant polish, and is rendered non-absorbent and washable. This cement may be tinted with any colours required—either mixed with the finishing coat—worked as scagliola, or, after the cement is applied to the wall surface, it sets sufficiently hard within 24 hours to admit of painting or papering. As no efflorescence is given off, the most delicate tints may be applied with safety. It is more economical to use Portland cement and sand as an under coat, or selentic cement if quicker setting is required. Martin's and Keen's cements are also white and quick-setting cements, and may be used for similar purposes as the Parian; but the latter is considered to be most easily worked. Johns and Co.'s cement may also be used as a finishing coat on common plaster, for surfaces to be painted, &c.—S. M. E.

QUESTION 53.—In designing cement or plaster cornices and ceilings, what principles should be observed?—The outline or profile of cornices should be designed so as to suit the apartments in which they are formed; the members must be proportioned so as to give the best gradations of light, according to the position of windows, keeping in view the friable nature of the materials to be employed, and avoiding thin edges with deep under cuttings. The arrangement of mouldings in a cornice will be regulated by the relative height of various rooms, or the proportion that height bears to length and breadth of apartments. Where the ceiling appears too high for the size of room, the apparent height may be diminished by forming the cornice chiefly on walls, or by introducing a coving springing from walls to ceiling, with any curve suitable. If the ceiling is low, apparent height may be obtained by forming a cornice with slight projections thrown chiefly on ceiling—a hollow being worked at junction of walls and ceiling so as to give a lighter appearance, and prevent excess of material at that point. Increased projections require to be supported by "dubbing out"—by driving in flat-headed nails—or by bracketing; or, what is more substantial, by corbelling out the brickwork approximately to the profile required. A section of the intended cornice may, with advantage, be tried in position, and the effect of adding enrichments, or the cutting-in with different colours noted, before a final selection is made. In designing ceilings the form and height of rooms will regulate the construction; when of a good height ceilings are best formed in panels. If arched or domed the panels should be arranged to accord with direction of rafters, &c. For flat ceilings the divisions formed by roof trusses, or by girder floors, with binders between, may be advantageously used, the laths or battens being fixed to fillets nailed to sides of same. Single floors with deep joists at intervals are also well adapted for such a construction. The projecting timbers may

either be wrought, or covered with wood casing or plaster, adding mouldings or enrichments as required. The main divisions of ceiling should range, so as to come over the solid parts of walls and not over openings. On ordinary ceilings a "key" may be obtained for the required projections in forming panels, by using flat-headed nails or bracketing. The number, size, and shape of panels formed will depend on the extent of surface to be covered, and shape of room. The centre panels—especially with coved ceilings—may be more deeply recessed than the others, and should be finished with a centre piece. Deep recesses should not be given to panels when the ceiling is low, as the shadows formed tend to darken the room. In such positions the ceiling should be flat; or with slight projections formed in the plaster.—S. M. E.

QUESTION 54.—Give a specification for general plastering.—The internal plastering to be executed with well-brut chalk lime of good quality, well mixed with clean, sharp drift, or river sand, and strong hair. The laths to be strong laths and half-laths, nailed at both ends with cast-iron nails. Lath the partitions and ceilings, render the walls, and float, set, and finish for paper, and whiten the ceilings. Twice lime-white the walls of cellars and stairs leading to them, also out-houses. Run cornices to drawing, dining, and breakfast-rooms, 12in. girt, with one enrichment to each. 2 1/2in. girt, the cornice to principal entrance and hall to be 9in. girt, and to the landings, bedrooms, and dressing-rooms on first-floor, put cornices, 7in. girt. The external work to be run, moulded, and finished in Portland cement of the best quality, in the proportion of 1 of cement to 3 of clean sharp sand.—ATTNEAVE.

CHIPS.

A new new girls' industrial school was opened at Sale on Friday last. The building is a plain structure of brick, dressed with stone, and has been erected from the designs of Mr. R. C. Price, of Manchester; the contractor being Mr. Wm. Southern, of Salford. The total cost was about £5,845.

Arrangements have been made for a visit of the members and associates of the Society of Engineers, on Tuesday, the 17th inst., to the works of the Victoria Dock Extension, Mr. A. M. Rendel, M.A., engineer, by permission of the London and St. Katharine's Dock Company.

The memorial stones of new National Schools at Seaforth were laid on Monday. The building will be entirely of brick, specially moulded and faced, the style being Gothic. It will accommodate about 500 children, and cost £4,000, exclusive of the site. The architect is Mr. Henry Hartley, of Lord-street, Liverpool, and the builders are Messrs. W. and G. Johnson.

The offer of Mr. Derboline, architect, of Manchester, to supply plans for a new abbatoir at Cardiff, for the sum of fifty guineas, has been accepted by the Cardiff Town Council.

An outdoor rink and pleasure garden were opened at Southend-on-Sea, Essex, on the 29th June. The rock-work is by Mr. Streeter, of Southend, the statuary and fountain by Mr. Brucciani, of Russell-street, Covent-garden, and Mr. F. Garon is the engineer.

The Essex magistrates last week passed, in Quarter Sessions, plans by Mr. Stock, county surveyor, for erecting the first block for 360 patients, and a portion of the administrative departments, of the new asylum at Wickham Bishops, near Witham, and authorised a committee to enter into contracts, at a maximum amount of £265,000, for their being carried into execution so soon as it has been ascertained that the water supply will not fail.

The Rotunda Theatre, Liverpool, was gutted on Monday morning. The fire commenced near the stage, and spread in either direction till the roof and walls fell in.

The erection of the new buildings for the Wesleyan Connexional School, Dublin, has just been commenced. The plans, which were selected in competition, are by Mr. A. Jones, and the outlay will be about £12,000.

The timber roof of the church of St. Stephen, in course of erection on Ayres' Quay, Sunderland, was blown down on Monday, seriously injuring half a dozen men and boys who were working on it.

The Epping rural sanitary authority has recently received and accepted the decision of the Lords of the Treasury as to the terms on which the water and drainage works—carried out in the town of Epping by the Local Government Board in their default—will be transferred to them. These are, to pay the authority £5,000, the amount of Sir J.W. Bazalgette's award, with the legal expenses since incurred, the terms of repayment to be hereafter settled by an order from the Local Government Board.

The south side of Holborn, from Great Tarnstile to the fire-engine station, Little Queen-street, and from there to the Restaurant, and from the Board of Works' offices to Drury-lane—in all about 14,000ft.—has just been repaved with the patent Victoria stone.

INDEX TO VOL. XXXII.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NEW SYNAGOGUE, PETERSBURG-PLACE, BAYSWATER.

WE give herewith an elevation of the west front of this building, which is now in course of erection, the foundation stone being laid a week or two since. The synagogue will have a frontage of about 71ft. to Petersburg-place, and a depth of about 100ft., and it will be well lighted on all four sides. The main entrance will be by a recessed porch, in the centre of the west frontage, flanked by two turrets which terminate with minarets. There will be in addition two subsidiary entrances at the north-east and south-east corners. There will be four staircases leading to the galleries. The dimensions of the building on the ground floor will be 65ft. by 61ft., and on the gallery level 83ft. by 61ft.; and it is calculated that the entire building will accommodate about 900 worshippers, although seating for a much smaller number will be provided in the first instance. The style is Græco-Byzantine. The internal arrangements will differ somewhat from those which usually obtain in the orthodox London synagogues, the Ark being intended to be in the nature of a shrine placed in an apse, or vaulted recess, as in the Berkeley-street Synagogue. The choristers will be placed in a gallery at rear of the Ark, and nearly level with the ladies' galleries. In this position they will be well heard, without being seen by the worshippers. The Ark and Almemmar will be of marble. The exterior of the building will be of red brick, with dressings of red Mansfield stone. Mr. N. S. Joseph, of Coleman-street, and Messrs. Audsley, of Liverpool, are the joint architects. The works of the substructure have been carried out by Messrs. Adamson, of Hammersmith. The tenders for the superstructure have not yet been delivered. We hope to give, at an early date, further drawings of this interesting building.

PEEBLES CHURCH.

THE parish church of Peebles, a work of the end of the last century, is a building of the old U. P. Kirk type, and may be described as four walls forming a square, covered with a flat-pitched hipped roof, and altogether devoid of architectural pretension. Our illustration shows the church as proposed to be rebuilt, or, more correctly speaking, transformed and enlarged, for the old walls are retained as far as possible, with new windows and buttress, turret and gable added. The design, which is by Mr. W. Young, of Exeter Hall, Strand, has been approved.

NEW CHURCH FOR PENYCAE, N. WALES.

THIS church (which we illustrate to-day from a drawing now on view at the Royal Academy) is about to be commenced, to afford means of public worship for a large and principally

mining population. It will be about three miles distant from Ruabon; local stone from a neighbouring quarry will be employed; and the roofs will be covered with grey slating, finished with a tile ridge. All the external woodwork will be of oak. The church will seat 300, and will be capable of future enlargement by the addition of a north aisle when required. Economy of material and labour are principally aimed at throughout. Mr. Aston Webb, of Duke-street, Adelphi, is the architect.

ROPE WORKS OF MESSRS. WILLIAM TERREL AND SON, BRISTOL.

THESE works, which are of a very extensive nature, embrace the manufacture of wire as well as hemp, rope, and, in a separate department, that of patent packing. They cover a large area of ground, with, however, a comparatively small frontage. The front and return angles of the building, as far as shown on the illustration, are executed with polled Cattybrook facing bricks and freestone dressings. The contractors for the work were Messrs. Eastbrook and Sons, who have carried it out under the superintendence of the architect, Mr. Stuart Colman, of Bristol.

NEW SCHOOLS, &C., AT BILLERICAY.

OUR view of these schools and residences, now in course of erection, is taken from the south-east, and shows the infants' and girls' schools on the left, the residences in the centre, and the boys' school on the extreme right. They are built of red brick, with black brick bands; the heads, sills, and mullions of the windows being of stone. The main timbers of the schools are of pitch pine; the roofs are covered with tiles, finished with Cooper's crested ridges and terra-cotta terminals. The accommodation is for 135 boys, 135 girls, and 130 infants. The buildings are situated on a fine site of more than an acre and a half in extent. The schools and offices are being erected by Messrs. Ruffell and Cross, of Billericay and Hutton, at a cost of £4,487 10s., including fencing all round the site, and about an acre of gravelling. The designs are by Mr. J. E. K. CUTTS, architect, of 28, Southampton-street, Strand, and were selected in competition.

SHOPS IN OXFORD-STREET.

THIS conspicuous block of buildings is now in course of erection in Oxford-street. The greater part is already finished, and a portion let and occupied. The buildings were designed by Mr. John Thos. Wimperis, of Sackville-street, and the works executed by Messrs. Patrick and Son, of the Westminster-bridge-road. The site is a commanding one, and every advantage has been taken of the situation, the corner shop having a very extensive frontage in North Audley-street, the angle being treated in a specially characteristic manner. The fronts are entirely of red brick, red terra-cotta being used for the balustrades, the large windows of upper story, and wherever else it could be well and appropriately introduced. The lower or shop fronts and cornices are of red Mansfield stone; so also are the balconets, which are furnished with a very appropriate iron railing, in character with the rest of the design. The roofs are covered with red plain tiles, the angle spire surmounted by a fine terminal and gilded sunflower; the upper sashes, casements, &c., are painted white—the shop sashes ebonised. The buildings are on the Duke of Westminster's estate.

THE BUILDING NEWS DESIGNING CLUB—A MEMORIAL CROSS AND CHANCEL SCREEN.

THE page illustrations of these subjects we now give will enable our readers to form their own ideas of the justice of our decision. We give three of the selected designs for the Memorial Cross and one for the Chancel Screen. For our critical remarks we refer our readers to our issue of June 22nd last (pp. 616-7 of last volume).

NEW BUILDINGS AT BRADFORD.

BRADFORD, says the *Leeds Mercury*, can never be considered a "fine" town; but a large number of new buildings have recently been erected there, which are not surpassed by any in England. One imposing pile extends from Kirkgate to Hustlergate, having a front-

age to the new street which supersedes the old Post-office passage. The new Liberal Club occupies the most prominent position in this new street, now known as Bank-street. The site was a costly one, varying from £46 to £52 per superficial yard; and, in order to obtain a revenue, the ground and basement stories of the club buildings have been appropriated for shops, and also for the banking office of the Halifax Commercial Banking Company. The interior accommodation of the club has, therefore, been arranged on the three upper floors of the building. The style of architecture is Italian, and the cost of the building, exclusive of land and furniture, will be about £21,000. Mr. Spencer was the clerk of the works. The adjoining pile of buildings has been erected for a drapery and silk mercery establishment. On the ground floor is a shop, 55ft. by 40ft. The plastering was done by Messrs. T. Cordingley and Sons. Mr. J. S. Wilson was clerk of works. The block of buildings at the top of the new street has been erected for a gold and silversmith's and jeweller's. The shop will be about 56ft. by 52ft. The plastering here has also been done by Messrs. Thomas Cordingley and Sons. Mr. John Wilson has acted as clerk of works. All these buildings have been erected from the designs and under the superintendence of Messrs. Lockwood and Mawson, of Bradford and London. Of a similar character to the above is the block of shop and office premises now being erected upon the site of the old White Swan Inn and other property in Market-street, from the designs of Messrs. Milnes and France. The new buildings will comprise altogether forty-four shops, forty-six offices, sixty-five market-rooms, and several warehouses. These are disposed in the three frontages to Market-street, Charles-street, and Brook-street, which enclose a quadrangle, wherein will be placed two blocks of shops and offices, separated from each other and from the outer buildings by arcades, which will be covered with an ornamental glass roof. These arcades are approached by four archways, filled in during non-business hours with handsome iron gates. The style adopted is Italian. Scoured ashlar has been freely used in the three frontages, and also in the walls of the arcade, the wall spaces being covered with decorative tiles. The whole of the floors will be fireproof, and will be laid with tiles, cement mosaic, and cement concrete. On the opposite side of Market-street more new shops and offices have been erected. The front elevation is of dressed stone, the style being Italian. The contractor was Mr. T. Holliday; the architects are Messrs. Knowles and Wilcock, of Bradford. Passing along up Darley-street, we find that the second half of the new Kirkgate Covered Markets is making rapid progress. When finished, there will be found inside fifty-two shops and eighty-two covered and open stalls, or in all 134 separate tenements. The market will have a central level entrance in Darley-street, and a spacious entrance, with steps down, from Godwin-street and Rawson-place. A second dome in the market roof, 50ft. diameter, is being constructed over the latter entrance, to correspond with the one now at the Kirkgate entrance. At the north-east corner of this market block of buildings, fronting into Darley-street and Godwin-street, and extending from archway to archway, the whole of the upper floors have been appropriated for the new Free Library. On the first floor will be the men's reading-room, 75ft. by 37ft. 6in., extending up two stories, with a gallery round the same at mid-height, and lighted by a continuous lantern light. Another room, 92ft. by 40ft. wide, will form the women's reading-room, and the issue department or lending library. On the upper floor will be the reference reading-room, 110ft. long, 40ft. wide, and 30ft. high, lighted by side lights, and also by a continuous lantern light. The Corporation, on completing the above works, will have finished the scheme of markets reconstruction which has occupied several years to develop, and has included the belt of outside shops fronting Kirkgate, Darley-street, and Godwin-street; also the "Schiller Verein" Club, the Market Tavern, the Trevelyan Hotel, and numerous large shops. The architects for the works complete are Messrs. Lockwood and Mawson, of Bradford and London.

THE INSTITUTE OF CIVIL ENGINEERS.

THE award made by the council of this society for original communications, read at the ordinary meetings during the session 1876-77, or printed in the "Minutes of Proceedings" without being publicly read or discussed, have just been announced. Twelve papers were read, and eight others have found a place in the volumes; and, in respect of these twenty articles, ten awards have been made, while, in accordance with custom, a contribution from a Vice-President—Sir W. G. Armstrong, C.B., F.R.S.—on "Water-pressure Machinery" was not considered in the adjudication of premiums. Two Associates of the Institution, Mr. W. W. Beaumont and Mr. W. C. Unwin, receive Watt medals and Telford premiums for their essays on "The Fracture of Railway Tires" and "The Resistance of Boiler Flues to Collapse." Five Members—namely, Messrs. W. Anderson, J. B. Redman, H. Robinson, A. McDonnell, and R. H. Brunton, get Telford premiums for their memoirs on "The Emission of Heat by Hot-water Pipes," "The River Thames," "The Transmission of Power," "The Repairs and Renewals of Locomotives," and "The Japan Lights." Three gentlemen unconnected with the institution have also obtained awards, two of whom take Telford premiums—viz., Mr. Robinson Souttar and Mr. I. J. Mann—for their articles on "Street Tramways" and "The Testing of Portland Cement"—while the other, Mr. C. Norman Bazalgette, for his inquiry as to "The Sewage Question," has the Manby premium. Out of 11 papers submitted by students, seven have been deemed worthy of rewards. Mr. P. R. Allen has gained the Miller scholarship of £40 a year, for three years, for his communication on "Machine Tools," and Miller prizes have been adjudged to Messrs. A. C. Hurtzig, C. G. Smith, R. J. G. Read, N. Watts, W. J. Chalk, and J. C. Mackay.

COMPETITIONS.

CARLISLE FEVER HOSPITAL.—The design submitted under the motto, "Nightingale," has been accepted in this competition. The authors are Mr. Fredk. W. Roper, of Adam-street, Adelphi, and Mr. I. Murchie, of Carlisle and Barrow-in-Furness, joint architects.

PARLIAMENTARY NOTES.

ST. MARGARET'S CHURCH.—The Chancellor of the Exchequer last week, in reply to Mr. Baillie-Cochrane, said the commissioners of the Exhibition of 1851 had recently leased some land on which a lofty building was to be erected, but it could not be so lofty as to injure the view of the Albert Memorial. The Government had subscribed a sum of £15,000 towards the restoration of St. Margaret's Church. The designs for that restoration were in the hands of the authorities of the parish—the rector and the churchwardens. Her Majesty's Government had nothing to do either with postponing or accelerating the alterations.

FETTER-LANE IMPROVEMENTS.—In answer to the Earl of Shaftesbury, Earl Beauchamp stated, on Tuesday, that the accounts which had appeared in the newspapers of the eviction of the tenants of certain buildings in Fetter-lane were somewhat exaggerated. The buildings had been reported by the Sanitary Committee of the Commissioners of Sewers to be in a disgraceful condition, and the proprietor had given his tenants the usual three months' notice to quit, in order that the necessary improvements might be carried out. At the end of that time, however, the tenants persistently refused to leave, and the proprietor was obliged to call in the assistance of the police to obtain possession. Whether the evicted people had been unable to obtain other quarters he (Earl Beauchamp) was unable to say; but they were certainly reminded more than once that they would be obliged to remove at the expiration of the legal term of notice. Of course, when large blocks of buildings had to be pulled down, it was impossible that some cases of hardship should not occur, but he was sure their lordships would agree that it was undesirable to extend indiscriminate sympathy to people who had deliberately set themselves to defy the law.

The Limerick Corporation has just purchased for £27,000 the works of the United General Gas Company in that city.

The only gold prize medal for wood-working machinery at the Cape Town Intercolonial and International Exhibition, has been awarded to Messrs. F. W. Reynolds and Co.

Building Intelligence.

BEVERLEY.—On Friday the memorial stone of a new church at Beverley was laid. The style will be Geometric Decorated of the 13th century. The exterior will be faced with Bradford parpoints, with Whitby stone dressings. The interior will be faced with red brick. The church will consist of nave, north and south aisles, two vestries, organ chamber, chancel, narthex, and south porch. At the south porch there will be a tower and spire, rising to a height of 175ft. The length of the church, exclusive of the narthex, is 101ft. Sin., and the width of the nave and aisles 48ft. The chancel is 38ft. by 23ft. 6in. Open benches of pitch pine will be provided, affording accommodation for about 300 persons. Mr. A. Richardson, of Beverley, is the builder, and the plans have been prepared by Mr. J. S. Crowther, architect, Manchester. The work is being carried on under the superintendence of Mr. Dickenson.

CANTERBURY.—A new cemetery at St. Thomas's-hill, Canterbury, was consecrated on Wednesday week. The buildings, which comprise two chapels, have been erected from the designs and under the directions of Mr. John Green Hall, architect, Canterbury. There is also a lodge for the curator, a mortuary, and a hearse house. The chapels on either side have their entrances under a central tower, which rises to a height of 106ft. The style is late 13th century. The exteriors of all the buildings are faced with Kentish rag stone with Bath stone dressings, and the roofs are covered with plain and ornamental tiling. The roofs of the chapels on the interior are open timbered, stained and oiled, with arched ribs resting on stone corbels. The length of each chapel internally, exclusive of the chancels, is 30ft. by 18ft. wide. The works have been carried out by Mr. H. B. Wilson, at a cost of £4,160. The carving has been executed by Mr. Candy, of Croydon.

FOUNTAINBRIDGE.—There was opened on Sunday a church erected by the Evangelical Union congregation at Fountainbridge, near Edinburgh. The new church, which was designed by Messrs. W. and J. Hay, Liverpool, presents in style Early Pointed architecture. The dressings of the door and windows are of Binny stone, and the general facing of the wall from the Hailes quarry. Of the church proper no part is visible from the street. It is approached from the central corridor, which leads to an inner porch. The church is divided by iron pillars into nave and narrow aisles, of four bays, with longitudinal and transverse arches, and is capable of accommodating 400 persons in comfortable pews of varnished pine.

METROPOLITAN BOARD OF WORKS.—A new committee of fifteen members, to be called the Special Purposes and Sanitary Committee, was appointed by this Board on Friday, to deal with the questions connected with the ventilation of sewers and the sale of gas, the Gas and Petroleum Act, Slaughterhouses, Explosives, and other Acts. The sanction of the Board was given to the borrowing, by Kensington Vestry, of £11,578, for defraying the cost of purchasing horses, carts, harness, shoots, and skips, at an annual rate of interest not exceeding 5 per cent., the principal to be repaid by instalments over five years. A second application from the same vestry, for permission to borrow £8,600, to defray the cost of works at Cremorne and Hammersmith wharves, and purchasing certain leasehold premises in Warwick-road, Kensington, and for buildings and repairs at the same, was granted, the amount being advanced by the Board on condition that the vestry take up the loan at once at £3 15s. per cent., the principal to be repaid by instalments within fourteen years. A £10,000 loan was granted to Newington Vestry, for granite paving works, on similar terms to the last, the principal to be repaid, with £3 15s. per cent. annual interest, within twenty years. Upon similar terms, but repayable in thirty years, a loan of £20,000 was granted the guardians of St. Olave's Union, for making additions and alterations to their infirmary at Rotherhithe. Mr. Lloyd moved:—"That it be referred to the Building Act Committee to

ascertain and to report to this Board the number of houses adapted to the artisan class that have been built within the last three years, or are now in course of construction, distinguishing whether they are four, six, or eight-roomed houses, or larger combined dwellings to be let in rooms or flats, also locality of the same, and the number of residents the houses would accommodate. The motion was criticised as being too vague in its reference to "houses adapted to the artisan class," and Mr. Lloyd eventually withdrew it.

PUBLIC HEALTH.

The Leading Journal of Sanitary Science and Progress. The number published July 13 contains Index and Title to last volume, together with articles on Consumption and its Cause, The Remedies for River Pollution, on the Exclusion of Sewer Air from Houses and Public Buildings, The Sanitary Institution of Great Britain, A Remarkable Water Analysis, The Borough of Houlton and its Medical Officer, Sanitary Novelties, Public Health Reports, Parliamentary Notices, Legal Intelligence, Water Supply, Correspondence, Intercommunication, The Editor's Table, Gleanings, &c. Price Two-pence. Annual Subscriptions post-free, Eleven Shillings. E. J. KIBBLEWHITE, 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32l. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

Intercommunication.

QUESTIONS.

[5059].—Cast-Iron Girder.—Wanted (for comparison with own figures) the dimensions of a cast-iron girder for a fire-proof floor, having 16ft. bearing, and being 9ft. 1 1/2 in. from centre to centre. For a honing warehouse is 3cwt. too much to allow as a permanent safe load? Whether is it preferable to curve the bottom plate or the web of the girder?—CAST IRON.

[5060].—Measuring Buildings.—Will some of your readers kindly inform me on the following? Where is there a small town or village within 50 or 60 miles of Bradford, Yorkshire, where a student might spend a week or fortnight, measuring and sketching some good examples of mediæval domestic architecture? Also what good books are published on the subject, with prices? Any hints as to the best mode of proceeding will greatly oblige—A STUDENT.

Our Office Table.

MR. ALEXANDER KELBY has sent for our inspection one of his "American Premium Door and Gate Springs," and we are well satisfied, both with its action and appearance. It is cheap and effective, of simple construction, and easy application and adjustment. It consists of a coil of finely-tempered steel wire, specially manufactured, we believe, for the purpose, and which we have somewhat severely tested so far as its quality is regarded, suspended on pivots, so that it will accommodate itself to the angle of the door as it is opened and shut. By this means, also, all bulging or straining of the spring is prevented, and the very great advantage is obtained, that it can be attached and detached without removing the screws that fasten it to the door. It can be adjusted so as either to open or close, or partly close, a door, as may be desired, and either change can be effected in a few seconds by anybody. Its appearance is ornamental to the door rather than otherwise; and altogether we think it is the best spring for external use that we have seen.

MR. WILLIAM MORRIS, as hon. secretary to the Society for the Protection of Ancient Buildings, has addressed to the Dean and Chapter of Canterbury Cathedral a protest from the committee of his society against the reported intention of the Dean and Chapter to remove from the choir the ancient stalls. The society considers such a course of action injurious to the history and art of the country. The memorial proceeds:—"The society begs to point out that this woodwork is remarkable for its intrinsic beauty, and although of comparatively late date is a noble example of the art of its period, and in no way interferes with, but rather adds to, the architectural effect of the building. It is stated that these stalls conceal portions of more ancient work, part of the fittings of Prior Eastry; but as the work of that eminent architect is left in a very fragmentary condition, and any restoration must be, on the whole, conjectural as to design, and modern as to workmanship, the society feels that it would be a loss, rather than a gain, to remove, for the purpose of such restoration, a beautiful and untouched work of a former age. The society takes this opportunity of deprecating any attempt at imitating the supposed condition of the choir at any past period of its history, being convinced that, however lamentable former destruction of ancient fittings and decoration may have been, the restoration of them is impossible, and can only lead to a condition of things still more grievous to all lovers of art, and still more destructive of the history and dignity of the cathedral."

MR. JUSTICE MANISTY, in his charge to the Grand Jury at the recent Newcastle Assizes, adverted to the two great agencies now at work throughout the kingdom for ameliorating the social condition of the poorer classes by education, and by improving their homes. He did not know which movement they might consider of the most importance, as they should ever go hand in hand, but he thought they could expect very little good results from educating children during the day if they had to return to scenes of vice, filth, and misery at night. He knew there was great diversity of opinion on this matter, but he for one doubted whether they should expend the larger amount of money on education and the smaller on improving the dwellings of the poor. As there is no place in the kingdom where the adoption of the Artisans' Dwellings Act is more urgently needed than Newcastle, and as the learned judge is connected with the district by family and other ties, and therefore well acquainted with its sanitary deficiencies, we trust his remarks may have some effect in expediting the long-deferred improvement scheme of the Corporation under the above Act.

THE general annual meeting of the subscribers and donors of the Builders' Benevolent Institution will be held at Willis's Rooms, King-street, St. James's, on Thursday, the 26th July, at 3 o'clock p.m., to receive the report for the past year, to elect president, treasurer, directors, and auditors for the year ensuing; to sanction the alteration of Rule 1, increasing the pensions; to alter Rule 15, section 2,

authorising the committee to use instead of funding the donations for the general purposes of the institution, and to otherwise generally amend the rules of the institution. A copy of such revision may be seen at the office, 4, Vernon-place, Bloomsbury-square, W.C.; and other matters connected with the welfare of the institution.

LEGAL INTELLIGENCE.

ABRUPT TERMINATION OF CONTRACT JUSTIFIED BY THE CONTRACTORS' NEGLIGENCE.—Trevena v. Watts and Another.—An important point has been decided in the Court of Appeal, at Westminster, before the Lord Chief Justice and Lords Bramwell and Brett, by which the opinion of the lower court (Justices Mellor and Lush) was confirmed.—The plaintiff is a builder of Plymouth, and the defendants, Messrs. John Watts and Co., engineers and founders, of the Broad Weir Engine Works, Bristol. The parties entered into a contract for the erection of a range of foundry buildings, under the direction of Mr. Henry Masters, architect, of Park-street, Bristol, and it was alleged that, in consequence of the builder not proceeding with proper despatch, and in neglecting to comply with the architect's reasonable orders, the plaintiff, after having legal notices served upon him, was dismissed from the further execution of the works, and the works have been finished by others. The plaintiff claimed a large sum alleged to be due to him for work he had executed. This question, also all other questions, were referred to Mr. Alfred Wills, Q.C., to decide all differences between the parties. In the progress of the arbitration the plaintiff considered he had a point of law in his favour, and the arbitrator granted him a special case upon the following questions:—(1st). Were the defendants justified under the 18th clause of the contract in entering upon and taking possession of the works? and (2nd) apart from the 18th clause, were they justified in putting an end to the contract? By the decision of five judges it has been settled that Messrs. Watts and Co., the defendants, were justified in both cases; and the court decided the question that if a builder employed under a special contract wilfully delays the works so that injury is inflicted on the employer, the employer may remove him and get the work done by some one else, and not the less so because there may be special provisions in the contract to prevent undue delay—as, for instance, the imposition of penalties.

THE ARTISANS' AND LABOURERS' DWELLINGS COMPANY.—The Secretary of the Artisans, Labourers, and General Dwellings' Company, Mr. W. Swindlehurst, and an estate agent, named Saffery, were brought up at Bow-street, on remand, on Tuesday, charged with defrauding the company of upwards of £30,000. The case entered into was that of the purchase of land in Harrow-road from All Souls' College, Oxford, for £32,000, which the prisoners sold to the company for £45,000. The prisoners were again remanded, and Mr. Swindlehurst's bail was increased.

BACKING OUT OF A SUB-CONTRACT.—At Scarborough County Court, on Saturday, an application was made on behalf of W. Peacock, builder, of Scarborough, against J. K. Pexton, joiner, of the same town, who is insolvent, and has filed a petition for liquidation. In August, 1874, plaintiff entered into a contract with Mr. J. Kitchin for the erection of 10 houses on the Ransdale Closes Estate, belonging to that gentleman. The amount of the contract was £22,250. Pexton submitted an estimate to plaintiff for the woodwork, which he offered to supply and execute for £6,100. He found, shortly afterwards, he had made a mistake, and refused to proceed with the work. Owing to Pexton's repudiation of his sub-contract, the houses were not completed, and plaintiff was a loser, his claim being now submitted for £1,614. Plaintiff's estimate was based, to some extent, on Pexton's figures. The latter at one time said that rather than see Peacock lose he would go on with the work at the sum named. Plaintiff went on with the buildings, and when ready for the first floor joists, Pexton sent some timber for the purpose, but it was condemned by the clerk of works as not agreeing with the specification. The work was stopped, and it was then that, in answer to plaintiff requesting Pexton to go on with the work, the latter replied that he could not do it for less than £6,700, as the price of wood was greater than he thought it would be, and that he had sent his revised quantities to Mr. Bury, the architect. Plaintiff replied that he should hold defendant to his contract. Plaintiff's solicitor now contended that the case came fairly under the 4th section of the statute of frauds, and that where a party signed a written proposal to do work and that proposal was then accepted and acted upon, it was a sufficient memorandum, and damages could be claimed for non-fulfilment. For the defence it was argued that there was neither a written contract nor any part fulfilled, plaintiff having admitted that his acceptance of Pexton's offer was a verbal

one. The Judge held that there was a contract between the parties, and gave judgment for plaintiff. The case, he said, came under the 17th sec. of the statute, and the evidence of both parties proved the verbal acceptance of the tender. Plaintiff expressed willingness to submit the question of positive amount of damage to a referee, and a verdict was entered accordingly, costs being allowed out of defendant's estate.

SLATES — SLATES — SLATES.—Bangor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each; 28ft., 2s. per foot; 35ft., 2s. 4d. per foot.

DEALS—BATTENS—FLOORING.—Send for price list.—R. MAY & SON, Timber and Slate Merchant, Acorn Wharf, Old Kent-road, London, S.E.

Trade News.

WAGES MOVEMENT.

FALKIRK.—The slaters in Falkirk have resumed work at the masters' terms—a month's notice, on the expiry of which their demand of ½d. more per hour will be granted.

WESTON-SUPER-MARE.—The master hinders and contractors throughout the Weston-super-Mare district have conceded the demand of the labourers for a general advance of half a crown per week and a reduction of one hour's labour on Saturdays, making the men's wages £1 2s. 4d. for a working week of 5½ hours.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's Ointment should be well rubbed upon the pit of the stomach and region of the heart, in that particular form of indigestion which gives rise to palpitation, shortness of breath, and a suffocating sensation. Every distressing symptom soon yields, digestion becomes easy, the spirits light, and good health returns.

TENDERS.

ANDOVER.—For the erection of new farm buildings at Middle Wyke. Mr. J. Hillary, architect:—

Brown, G. W.	£1,025
Eyles	600
Brule (accepted)	575
Sainsbury	499

ANERLEY.—For alterations to the Railway Hotel, and two new houses, with shops, adjoining. Messrs. Bird and Walters, architects. Quantities supplied:—

Downs	£2,755
Nightingale	2,740
McLachlan and Son	2,684
Smith, R. and E.	2,514
Taylor, G. (accepted)	2,437

BARNES.—For additions to schools at Friern, for the Rev. R. Morris. Messrs. E. Habershon and Brock, architects:—

Woodhall (accepted)	£555
----------------------------	------

BISHOPS STORFORD.—For additions to Church of All Saints, Hockerill. Mr. Joseph Clarke, F.S.A., diocesan architect; quantities supplied by Mr. Sidney Young:—

Hill and Higgs	£6,960
Dove Brothers	6,900
Roberts Brothers	6,667
Bell and Sous	6,356
Gibbons	6,290
Parmenter	6,200
Glasscock	6,180
Gregory	6,145

BLACKHEATH.—For repairs and decorative works to be done for W. C. Birch, Esq., at 13, Vanbrugh-park. Mr. W. Huts, architect:—

Hockley and Co.	£502
Pitman and Cuthbertson	475
Adams and Son (accepted)	445

BRIGHTON.—For the erection of a shop and warehouse in Whitecross-street, Brighton, for Messrs. Delland Wicks. Messrs. Holford and Clayton, architects, Brighton:—

Lockyer	£718
Garrett	746
Keup	700
Newham	619

BRIGHTON.—For the rebuilding of a range of workshops in North-street, Brighton. Messrs. Holford and Clayton, architects:—

Botting	£1,263
Cheesman and Co.	1,255
Lockyer	1,230
Barnes	1,227

CROYDON.—For a new branch bank at Croydon for the London and South-Western Bank, Limited. Messrs. J. and J. S. Edmeston, architects. Quantities by Mr. O. N. McIntyre North:—

Philipson	£6,079
Hyde	5,986
Cowland	5,984
Nye	5,960
Marriage	5,910
Coles	5,834
Williams	5,802
Legs	5,575
Adams	5,569
Taylor	5,475
Clarke and Bracey	5,397
Jarrett	5,330
Smith (accepted)	5,276

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 20, 1877.

THE ARCHITECT AND THE EMPLOYER.—I.

BUSINESS and art qualifications frequently go but ill together. It has been recorded by a well-known author that genius delights in solitude. Men of letters and art have been generally prone to avoid a life of energy and excitement; conversationalists have rarely proved to be the ablest writers; and artists and philosophers have certainly not been distinguished for "a ready mind." We suppose an analogous habit has unfitted the architect for active business. It is quite certain, however, that business tact and art ability are very rarely combined in him. It was said of a scintillant wit by a celebrated man that "he vanquished me in the drawing-room, but surrenders to me at discretion on the stairs." In like manner it is a fact of daily observation that the architect of business capacity vanquishes his more competent brother in professional pursuits. To qualify an architect for the active work of his profession we need hardly remind the reader of the importance of a business training. The pupilage system gives but a poor insight into the official routine required in the active practice of a profession in which so many commercial interests have to be mastered. How can the young architectural student hope to master the intricacies of a practice in which the artistic, the financial, and the legal minds are supposed to be blended? Confined, to use a Pecksniffian expression, to that "hotbed of architectural genius, the two-pair front," there is not much chance for the rising Martin Chuzzlewit in the profession to obtain even a modicum of business qualifications; whilst as for the less favoured Tom Pinche there is positively none. Except copying now and then a specification, the student has no means of becoming acquainted with the usual instruments or processes required in carrying on a business. We are constantly being asked questions relating to the liability of architects, their relations with their employers and with builders, forms of contracts and agreements, certificates, and a variety of other matters connected with architectural practice. It is our intention in this and the following chapters to give some hints on these questions; and with this object in view we shall follow the order of building operations, beginning with a few remarks on the duties and responsibilities of architects. The responsibilities of architects have been a prolific theme of disagreement from time immemorial, and nothing very definite has been laid down or determined. As a rule architects have to buy this kind of experience rather dearly, and lawyers have not aided them much. The author of one book says:—"After the plans are settled, and the work commenced, it must be distinctly understood that the client yields himself absolutely to his professional adviser." This is perhaps a rather uncompromising way of stating the case, and to the "client who pays" may look a rather one-sided arrangement. It is obviously fair to the architect that he shall not be unnecessarily interfered with by the employer, especially in those matters of experience and knowledge for which the latter pays. It is certainly unfair that he should be questioned and interfered with in matters of plan or construction after the drawings have been approved, though every architect knows to his cost how frequently this is the case. It may be urged that the client has a right to interfere if, when the work is progressing, he discovers something that he

did not quite understand when the plans were prepared, and on the first blush of the question this objection may appear a valid one; but it will be at once seen on reflection that if this questioning were permitted, the architect would be subjected to constant interruptions in the work, entailing probably expense, besides other graver inconveniences, such as that of breach of contract, &c. A recent writer (Sir Edmund Beckett) objects to the doctrine of the submission of the employer to the architect, but we cannot see where he would draw a line. It is only reasonable to suppose the authority of the architect must begin somewhere, if he is to be made responsible for his work, and every architect is well aware how ready some clients are to charge them with any mistake that may arise from vacillation or lack of firmness on their part. No doubt this is one of the *veacte questionnes* of architectural practice, and one we should like to see the profession take up and settle, for its own peace of mind.

Of course, every employer assumes his professional adviser competent; if he finds him not to be so he has a remedy. The question involves mainly the appointment of the architect, or rather the approval of the plans. In speaking of this question, Sir Edmund Beckett, whose authority as a lawyer may be taken, proposes the following condition as applicable to a competition:—"The committee will not be bound to accept any plan, nor to proceed with any one which they do accept, unless they find that a contractor with sureties in one-third of the amount of the estimate, to be approved by them, will undertake it for that sum. If no such contract can be made to their satisfaction, the whole proceeding is to be void, and the architect to have no claim upon them." This condition may appear a rather harsh one, though in this initial matter of selecting plans we can see no objection to what appears to be a just one to the party or individual who pays for the services or plans of the designer, as architects are not bound to compete under such a condition. It is evident the same terms apply to any individual who proposes to build and requires plans. If he finds the design too costly, he should not be bound to carry it out, and this might be made a stipulation at the outset. Unfortunately, however, it is not as a rule; hence the architect has a claim upon the employer for the plans prepared, and is fairly entitled in this case to be paid for them at the usual rate of 2½ per cent. on his estimate, or any fixed sum that may have been agreed. We are inclined to think an agreed sum should be fixed beforehand for this preliminary work, and it is certain much unpleasantness would be avoided if the architect made this a rule in his practice.

It may be as well to allude to the Government code of rules of agreement with architects. Here it is expressly stipulated that, if the commissioners abandon their intention of building, the architect shall be entitled to a sum to be fixed beforehand; that the plans and documents shall be the property of the employers (except sketches); if, after the working drawings have been made the work is not proceeded with, the architect to be paid a fixed sum; or if only a part is executed, he shall be paid a proportionate part of the remuneration fixed upon, and also a part of that upon the works abandoned. If the works are proceeded with, the remuneration (a fixed sum to be agreed) shall be paid as follows:—One-third on the execution of the contract, another third when half the contract price has been paid to the builder, and the remainder when the last payment is made. We are led to consider here the question of architect's charges. That the percentage system works badly most architects who have had any experience must ad-

mit. That it has been a cause of injustice no one will deny, and hence the Institute of Architects in 1862 laid down a more reasonable scale of charges. Before this scale was adopted, architects were paid by the unvarying 5 per cent., whether for a complex or a simple structure, whether for one or for any number of similar houses. This was manifestly unfair either to the architect or his employer, as the case might be. It further led architects into a pernicious plan of charging for extras or exceeding their estimates whenever a chance presented itself. The Institute rule has considerably modified this charge by providing that, in complicated structures, the extra labour entailed of arranging with artists and tradesmen should be paid for at the rate of 2½ per cent., and in settling other points that were previously left to custom merely. Still there is much that is unsatisfactory; and, as Sir Edmund Beckett has said, the R.I.B.A. has varied it chiefly in their own favour, and has not taken into account the differing degrees of labour the architect is called upon to perform. The 5 per cent., in fact, is made the minimum for all classes of executed work, no matter how simple or otherwise it may be. It is true the Institute observes that in a number of houses from the same design the percentage might be reduced, though this is only hinted, and no positive charge is laid down, as there should have been to make the scale a differentiating one, which it by no means is at present. Let us take for instance two extreme cases—one a row of small houses, costing about £200 each, and of exactly the same plan, and a restoration of a parish church, in which a great deal of Perpendicular woodwork exists. Now, the thought and labour entailed in designing the houses would scarcely take a day—the subsequent labour would be repetition and superintendence. If there were 20 houses in the row the cost would be £4,000, and at 4 per cent.—if an architect took it so low—he would receive £160. Let us look at the restoration. The plans in this case would involve a month's labour at the least, and the execution of the work would demand constant vigilance and numerous details; the thought and care bestowed would be unremitting; yet, supposing the contract to be the same in amount as the houses, the architect would only get his 5 per cent., or £40 more than the houses. It is true he would probably have a claim for arranging with artists, and say he received £300, the disproportion in the payment for skill and labour would still remain ridiculously great, and the architect in the first case would be paid at least thirty times, as well as in the second instance. Such instances are by no means unusual, and we think that in a fair scale of charges the degree of labour should have been considered. A new building is invariably less troublesome than a restoration in which a great deal of architectural detail is involved. But there are also classes of new buildings in which the differences are quite as great. For example, how much more complex is a well-appointed house than a warehouse, or even a school; and supposing the cost to be the same in both instances, the percentage on the latter would be at least 30 per cent. more remunerative. We might multiply instances. Shop premises and fittings are a great deal more troublesome than factories, hospitals than prisons; a vestry or town-hall is a vastly more complex structure than a church, and so on through a variety of other structures. In these cases it appears to us the proportion of plain walling and inclosed area, or capacity, should become the measure of charge, and if architects were paid on the plan, or by a scale regulated to the complexities of internal structure and arrangement—a graduated form of which might easily be prepared—

the anomalies of the percentage system would disappear. It is evident the division into four parts of $1\frac{1}{4}$ per cent. of the 5 per cent., though meeting the requirements of ordinary buildings, does not agree with the extremes we have indicated. Thus the preliminary sketch and design for a complex building like a town-hall, or a large house, is inadequately paid at $1\frac{1}{4}$ per cent. Again, in the other three divisions of general drawings, working details, and personal superintendence, the labour bestowed on such a structure would be fifty times greater than that on a plain building, such as a skating-rink or factory. It would be a simple matter, we contend, to suggest a classification that would meet all the cases likely to occur. Thus we might classify all works into three distinct groups—constructional, architectural, and decorative. Again, we might still more systematically divide all buildings into simple cellular and compound cellular, according to the number of apartments in plan; while architectural design in the abstract we might divide into classes denoting the material and the degree of complexity of detail. The subject is too large, however, to enter upon in this article.

THE THAMES EMBANKMENT.

THIS promenade yearly assumes a greater degree of completion. The plane trees on each side are beginning to throw a grateful shade on the wide foot pavements; the roadway itself is being remodelled, or macadamised, and the current of traffic since the opening of Northumberland Avenue has gradually increased from one of a thready intermittent character into a continuous stream. The clearing of the gas-works near the site of De Keyser's Royal Hotel, Blackfriars, has been followed by some architectural improvements, amongst which may be mentioned the blocks of offices in red brick and stone, in the Tudor style, at the bottom of Surrey-street; the completion of the areas of ground near the Temple station, and the erection and unveiling of the statue of Brunel at the corner of the triangular open space on the east side of Somerset House. The last-named object is a conspicuous feature, and its *localité* could not probably have been better chosen. The great engineer stands over a tunnel, which, as a work of modern times, may be considered to be one of the greatest, and to bear to the present age somewhat of the same importance as his own great tunnel under the Thames at Rotherhithe bore to a previous generation. Again he stands facing a work of equal engineering importance, if not of skill—namely, the Embankment itself. As to the character of the design we cannot say it is quite so poor as public works are generally credited to be; the best part of it is the winged base or background of masonry against which the great engineer stands. This screen or winged wall, if we may so term it, completes an awkward corner of one of those waste bits of reclaimed ground the Metropolitan Board of Works have done their best to adorn. It makes an easy turning, and utilises a corner in at any rate an unobjectionable way. We hope the space within the enclosure will be rather thickly planted with trees. The figure of Brunel, cast in bronze, is rather heavy, but the engineer himself was a heavily-built man. He is shown dressed in a light overcoat, displaying a loose vest, and standing in an attitude expressive rather of conversation than of thought. His right hand holds a pair of compasses, with which he appears to be playing with a nonchalance acquired from habit. As a work of the modeller the figure is quite above the average. The simple but expressive inscription, "Isambard Kingdom Brunel, Civil Engineer, born

1806, and died 1859," is cut in the stone pedestal, which on each side has a stone seat, moulded, and forming a portion of the base. The mouldings are bold, and of good design, rather French, and the upper part of the screen is terminated by flat scrolls or trusses, carved on the front with festoons. A little further eastward, and within the Inner and Middle Temple grounds, the new buildings, known as the Temple Chambers, are progressing rapidly, and already the façade towards the Embankment may be completed in the architectural imagination. The front is wholly of dressed stone, Portland apparently, and will be a striking addition to the architectural frontage of the Embankment. The elevation is pleasingly varied in plan by circular turret-like projections at the angles, and by three bays, two of which are bold canted projections, or windows, carried up the façade. In style, the architects, Mr. J. P. St. Aubyn and Mr. E. M. Barry, have adopted one of the richest varieties of the French Renaissance of the time of Francis I.; and the design recalls to mind the châteaux style, as we see it in the Châteaux de Blois and de Chambord. The panelled pilasters of the three main stories, with their diamond-shaped panels, the richly moulded window heads and shafted mullions, the fine carved work in the friezes and the trussed balconettes to second-floor windows, seem almost too refined for the adjacent buildings, and contrast rather singularly with the Temple Library and the surroundings of the eighteenth century Vernacular brickwork to which the new building is an adjunct. We are led to speculate on the result of this rapid importation of Renaissance. From the St. Stephen's Club-house to Blackfriars the leading buildings are, or will be, of this phase. It is true the new Opera House is still in abeyance, but we know what it is to be. The *embouchure* of the new street from Charing-cross will probably be in the same architectural dress; the proposed hotel, near Waterloo-bridge, recently illustrated by us, is also Renaissance; the new School Board Offices are conceived in a similar style; and now we have the Temple Chambers, while the large hotel facing Blackfriars-bridge forms the eastern *finale* of this series of attempts. There are evidently two schools now wedded to Renaissance—one taking the English phase and using brick, and the other French, aiming at a more refined sort of expression, in which the effect is sought to be produced by a more abstract use of architectural detail. Both kinds admit of considerable freedom and lightness of treatment, and they lend themselves to our civil structures with great ease. Let us hope at last the vagaries of Gothickesque and Queen Anne will be supplanted by a style of architecture in unison with our great thoroughfares. It is quite certain a row of quaint buildings in the picturesque garb of the seventeenth century would badly harmonise with the boulevard-like spaciousness of our Embankment; it would be like widening, levelling, and paving our narrow City lanes, retaining the old dingy buildings on either side. By the way, we notice Fleet-street is at last being paved by the Asphaltic Wood Company. Will the process have any effect upon the architecture essentially picturesque at present?

AMERICAN ENGINEERING.

AN historical record of engineering must always possess a great interest to the student of a civilised society, and especially instructive must be the engineering progress of a great country like America. We read of difficulties overcome by works of daring and enterprise that have scarcely their parallel in ancient times—the forces of

Nature brought into subjection, and harnessed to the work of piercing the mountain, or crossing a ravine, or some herculean task performed in which mind has overcome matter. The work of the engineer must always precede that of the architect; the "rough ways must be made smooth" before the refinements of art can be duly appreciated. America pre-eminently presents to us a nation rapidly transforming the obstacles of Nature, and we may say confidently she is passing through the engineering phase of her existence. In no country has engineering science made such rapid advances within the last half a century. We can point to bridges and viaducts and aqueducts that surpass in scientific ingenuity the more massive constructions of Rome, and to a railway system that can rival any of those of the older nations; while the art of canal construction has attained a development truly surprising. We can name the Erie Canal, the Chenango Canal—98 miles long, with 100 locks, extending from Utica, on the Mohawk, to the Susquehanna River. The progress of engineering, like that of other arts of civilisation, takes place by a series of successes and failures, and we look to the works of our Transatlantic brethren as a series of achievements in this art unexampled in the history of the world. One reason for this is that the American engineer has not been unduly led by traditional forms, and has relied mainly on his own resources and skill. Each great problem of construction, whether it be in bridge-building, reservoir construction, or canal formation, has been solved by the united experience and science of the age. In every branch there is a tendency to a uniform type of construction, as in architecture, and one might trace certain stages of progress, just as the scientific sociologist can, from certain facts and social phenomena, account for laws and societies of various types. Into this view of the subject it is not our intention to enter here, however interesting it might be; though it may serve to indicate the various influences at work if we briefly record the experiences of Mr. John B. Jervis, C.E.—a veteran in engineering, as detailed in a memoir read before the American Society of Civil Engineers, in October last year. The paper read furnishes us with the individual experiences of a practical engineer, who has taken part in the engineering constructions of his country during the present century. Mr. Jervis's first work was on the original construction of the Erie Canal, between Buffalo and Albany, in the State of New York, commenced in July, 1817. The author tells us his introduction to the engineering profession was as an axeman to his father in clearing a field of cedar swamp for the new line. The young axeman soon discovered a liking for the work; as an assistant to the rodman or "target-bearer" he examined the surveying instruments, and the idea of learning the mysteries of the art soon occurred to the young operative. The science of engineering was thought by the young aspirant to be a rather formidable study. Yet he appears to have overcome this idea, and soon engaged himself as a rodman at the modest sum of 12 dollars per month. At that period the art of engineering required little more than a knowledge of surveying, which was regarded as its basis. Full of youth and enthusiasm he started from Rome, N.Y., with a locating party, in April, 1818, and in July completed the location of the Seneca River, at Montezuma. A portion of the line was put under contract, and several small parties, each with a resident engineer, was organised to direct the execution of the work. Young Jervis was assigned to a party, having 17 miles in charge, under Mr. David S. Bates, who was a good land surveyor, but nothing more.

To show the limited engineering qualifications of this early period we may mention that the resident engineer gladly availed himself of his assistant's knowledge of levelling, which was greater than his own, and the young surveyor was allowed to run the levels. In the next year Jervis was made resident engineer, his master having more extended duties given him, and the salary was increased to 1.25 dollars per day and 0.50 expenses. We are told when this canal was constructed, the State of New York contained about 1,250,000 people—a large portion of it was a wilderness, and the surplus earnings of the citizens were employed in draining, clearing the forest, erecting houses, mills, and other works required by a newly-settled colony. Well might such an undertaking as this canal have been deemed insuperable at the time! It was thought it would sink the State in ruin. The aid of the Government was sought, and after the plan had been represented at Washington Mr. Jefferson remarked, "We are trying to make a canal three miles long at this city, and we have not been able to obtain funds from individuals, the State Government, and the General Government, to complete it, and now you ask us to aid you in building a canal, 300 miles long, through a wilderness. Preposterous!" Thus, in both the Erie and the Champlain Canals, the New York State entered single-handed into the schemes. Such was the state of the country when Mr. Jervis began his engineering labours, and we can only recall the difficulties overcome by Stephenson in the first railway adventure in England—the Stockton and Darlington line—as a parallel. Like the prejudice and traditions which our own Edward Pease and Stephenson had to encounter and surmount, Jervis had to stem a current; but the difficulty in this case was not so much prejudice and tradition as lack of money. One of the criticisms the Erie engineer had to meet with was the question of his skill to establish a true level of 60 miles long. To run a water level for 60 miles requires considerable care. When the water was let in the level proved to be correct. This was the first canal of any importance, and we gather from the paper various interesting particulars of it. The canal was at length commenced, after a preliminary survey and estimate had been made by two eminent land surveyors—Hon. Benjamin Wright, of Rome, N.Y., and Hon. James Geddes, of Onandago, who were appointed the chief engineers of the Erie and Champlain Canals. Mr. Canvass White, the assistant engineer, discovered the material to be used for the hydraulic cement, and prepared the plans for the structures of the great canal. As indicating the period, it is said that the chief engineer called on a carpenter—a Mr. Cady—to prepare a plan for the wooden trunks of aqueducts, which was adopted. In 1823 Mr. Jervis was assigned the duty of superintending the canal for a section of 50 miles from Minden Dam to the Mohawk River, having been made a resident engineer in 1821. This gave the author experience in the working of the canal. Weak points presented themselves, and the cost of keeping the section in repair was 600 dollars a mile. We are told there were no politics to be eared for, and the cost then compares in a remarkable manner with subsequent expenditures of 3 to 10 times the amount. In 1825 the canals were completed and opened for navigation, and Mr. Jervis resigned his employment. The success of the canals and the magnitude of their traffic gave impulse to canal enterprise.

The Delaware and Hudson Canal and Railway, projected by Messrs. Wurtz, of Philadelphia, in 1825, was the next work in which the author was engaged as principal assistant-engineer. The cost was estimated at 1,208,000 dollars, but the actual cost was

double. The rivers were not favourable to the piecemeal scheme proposed, or the slack water plan by dams and locks, and an independent canal was decided on—the sizes of which were 4ft. depth of water, 20ft. width of bottom, and 28ft. width at top water-line. The locks were 76ft. long, 9ft. wide, and capable of receiving a boat of 30 tons. From Kingston to Honesdale the canal is 106 miles, and has 110 locks, after which a railway of 16 miles is constructed to the coal mines of the proprietors in the Lackawanna valley, by a rise of 900ft. to the summit of the Mosaic mountain, and then a corresponding descent to the mines. Describing the canal at Kingston on the Hudson to the Delaware, the locks were of stone, with hammered face, and laid in hydraulic cement, the backing being in quick lime mortar. This last was a mistake, we are told. On the Delaware they were of dry masonry faced with timber and plank. The canal was finished in 1828. The railroad from Carbondale was an ascent 3 miles long by 5 inclined planes on an angle of one-twelfth, and these were worked by stationary engines, the cars being moved by endless chains passing over sheave wheels at the head and foot. The chain frequently broke, and hempen rope was substituted, which was found to work well, the sheaves being grooved to prevent slipping. Subsequently the hempen rope was replaced by one of wire. The descent was 500ft. in a mile, and to resist the weight of loaded trains, a friction brake was not considered safe, and Mr. Jervis proposed an ingenious mode of making use of the resistance of the atmosphere to overcome the preponderating force. Experiments upon a surface were made with different velocities, and at last the author attached to the shafts, or sheave wheels, sails, which, as the wheels revolved, gave motion to them, and retarded gyration. Each shaft had 4 sails of thin boards of about 20ft. square in area, and one of the sail shafts had a powerful brake to stop the trains at the head and foot of the planes. By the sails the velocity of the train was reduced to about 4 miles an hour. As business increased, the speed of the trains was augmented, and it became necessary to reduce the area of the sails. This plane was three quarters of a mile long, with a vertical height of 350ft. Rapid changes have followed; the planes ultimately were worked by steam and gravitation alternately. Thus the railway is now worked by stationary steam and gravitation, with no moving power. This combination of steam and gravitation has been used with success in other lines in connection with mines. Thus the railway from the mines at Pittston, 40 miles in length, is worked in this way in both directions, but the method is desirable only in mountainous countries, and this means of transportation has been largely developed in America. In time the traffic on the Hudson Canal increased, the locks were rebuilt with chambers 90ft. by 15ft., and the depth of water was raised to 6ft.; but the widening of the canal was not corresponding, and the ratio between the section of the boat and canal was defective. Mr. Jervis was appointed chief engineer when Mr. Wright resigned.

The Mohawk and Hudson Railway was the next work to which Mr. Jervis directed his attention. This passenger line extended from Albany on the Hudson to Schenectady on the Mohawk. Before this line the Erie Canal and stage coaches transported passengers from Buffalo to the latter place. Here, again, the sudden rise from the Hudson of 200ft., and another from the Mohawk, demanded the same method of inclined planes, then considered the only means available, and such planes were made at each end of the railway, which traversed a table land between.

The adhesive power of locomotive engines was not known at that time. After a few years the requirements of a miscellaneous traffic showed the utter inefficiency of this form of transport, and the author was a member of a commission appointed to consider the practicability of dispensing with it. A grade of 80ft. per mile at the Albany end, and of 40ft. at the other, was proposed and formed, and locomotive power is now employed. This early attempt at railroad construction is especially deserving of note, as indicating the initial idea. The rails were of wood, capped with a plate of iron, which in the cuttings was laid on stone blocks, and on embankments with timber cross-ties. The first locomotive weighed between 4 and 5 tons, had 4 wrought-iron wheels, and carried 75 to 125 passengers, at a speed of 25 miles an hour. Robert Stephenson, of England, constructed another of 7 tons, and it was called "John Bull." Landed proprietors were hostile to railways, as they were in this country; and we find this early pioneer of railways in America reproached as a barbarian, and his opinion that railway trains would be able to travel at a speed of 30 miles an hour pooh-poohed and made the pretexts for jests and effusions. The next step made was to improve the wheel base of engines, and the author made an improved locomotive with a 4-wheeled truck under the forward part as a support and a guide. Less vibration was experienced. Our own Stephenson built this engine, and it is said to have moved with "perfect beauty." At last this railway was extended, till it now reaches the Pacific Ocean at San Francisco. As our readers may be aware, the front truck plan is general in American locomotion.

The Cheroquo Canal, 98 miles in length, with 100 locks, was another undertaking in which resort was had to artificial reservoirs to supply its summit with water. It was thought that one-third of the rainfall could be depended upon over all loss. The proportion of rainfall estimated by rain-gauges and sluices was 40 per cent. as that to be depended on. In 1836 Mr. Jervis accepted the position of chief engineer to the Croton Aqueduct, and his connection with the Erie Canal (at which he was engaged in enlarging to 5ft. depth and 50ft. wide) was broken off. The Croton scheme was intended to introduce the water of the Croton river to New York. The location of the line of aqueduct had been made by Major Douglass from the Croton river to the north bank of the Harlem river, 33 miles, the grade being proposed to be 13¼ in. to the mile; but to Mr. Jervis, his successor, belongs, we are informed, the elaboration of the design and plans. Some interesting details are furnished of the work. One of the great features was the dam across the Croton for the head of the aqueduct. This was 40ft. above the river surface. At the south side was a rock rising from the river at an angle of 1 to 1½ to the head of the aqueduct. "The dam and its abutments on the river side were built on rock, and the extension of the weir was made by excavating the rock into the hill." The length of the weir was too short for the first flood before the dam was finished, and the embankment at the north shore gave way. The dam remained undisturbed, though the water rose 12ft. above the overfall. It was afterwards extended from the old abutment on the south side to the high level of the north side, thus extending the weir to 180ft. All the works had to be artificial, there being no rock. The great fall of water was broken by giving a curved form to the lower side of the dam, by which the falling body of water is gradually changed to a horizontal direction, when it reaches the apron, "and the reaction of the water in the river below." The curve, in this

case, has worked satisfactorily, the water in a high or low stage following close on the face of masonry." We are informed the ordinary width of the river is 100ft., and its greatest depth, 15ft. No settlement has occurred of any account since its completion, now 33 years. In Sing-Sing Bridge one peculiarity is the cast-iron lining of the conduit. This was to guard against leakage, which if only amounting to a sweating of the arch masonry, would speedily disintegrate the stone. To counteract the effect of longitudinal expansion and contraction, the author recommends an iron pipe, put together with the common faucet and spigot joint. The centring adopted at Sing-Sing Bridge was on the principle adopted by Rennie for Waterloo Bridge. To show the close jointing of the arch, a level taken showed its settlement to be less than $\frac{1}{2}$ in. The span is 88ft. We have no space to describe the Harlem river bridge, a quarter of a mile in length, half of which, or 600ft., crosses the river. Its height is 114ft. above tide water. These dimensions will convey some idea of the work. Some of the piers had to be placed on piles, others on solid rock. The foundation of the centre pier in the channel was carried down 40ft. without finding anything but sand. Piles were driven 12in. square, 35ft. in length, and in some cases they were driven 80ft. below the river surface. The shafts of the pier are hollow. We leave these details and those described for the conduit. The last was made for two 4ft. pipes. Against the engineer's protest 3ft. pipes were laid, and when the Water Commissioners often required a larger supply of water another pipe was placed on the top of the two others, which incurred a greater expenditure, and marred the simplicity and economy of the original design. Of the distributing reservoirs we may only remark that the main feature is the plan of hollow walls, whose retaining power had to sustain a pressure of 40ft. head of water, and hence it was deemed more economical to have a hollow wall, or two parallel walls, connected by cross walls, and these connected together at the top by brick arches. About 12ft. of the upper part was solid. Openings in the cavity were left to allow a man to examine the walls inside, and discover any leak. This ingenious mode of cellular construction has proved a success. We have no space left to detail other works by this engineer. The Boston aqueduct to supply that city with water, first abortive, was afterwards placed in Mr. Jervis's hands. The Hudson River Railway, the Pittsburgh and Chicago Railway, and the great railway from the head of Lake Erie to Chicago, called the Michigan Southern, and Northern Indiana Lines, were mainly constructed under the author's directions. In all these works a great deal of enterprise, tact, and engineering ability of the conquering sort were required, and Mr. Jervis seems to have been well fitted for this task. Statistics and passenger traffic had to be mastered to convince capitalists of the success of some of these great schemes, which have changed the character of the country. As he tells us, he had to encounter all kinds of opposition; to show that natural scenery would be improved by combining works of art with those of nature, and to prove a remunerative success. As regards scenery, perhaps American landscape has suffered less than the English. Mr. Jervis's narrative is instructive, at least, as showing us that the engineering progress of America has passed through similar stages to those of England, and that the impulses given to the railway system were of the same order, and had to encounter the same obstacles. It was first a struggle between the canal companies, then a compromise and combination, till at length it has assumed a special character of its own. Mr. Jervis,

like our own Stephenson, Fairbairn, and Brunel, was just the man required in the first period of enterprise of this kind, and for the building up of the engineering science.

LEAVES FROM A SKETCH-BOOK, A. A. EXCURSION, 1876.

AUGUST once more is almost here, and the season of holiday-keeping has again come round. People of nearly every rank and degree are looking forward to or are now enjoying their annual trip out of town, no matter how brief that trip may be. Arrangements are daily being made of every sort and kind, and architects with the rest are thinking of how and where to spend their holiday. With this intent the Architectural Association has just completed arrangements for its "annual excursion," which this year is to take place from Aug. 13th to 18th. The neighbourhood of Warwick and Coventry has been determined upon, with the first-named town as the headquarters of the party, which is to be limited to thirty. Last year, it will be remembered, a visit was made into Hampshire and Wilts, Winchester being chosen as a centre. The excursion was a thoroughly successful one, however far short it must rank for actual work done in comparison with its predecessors, conducted, as they were, under the immediate direction of their founder, the late Mr. Edmund Sharpe, whose energy and zeal inspired those accompanying him on the last occasion to such an extent that no less than 662 sketches, and these mostly elaborate and measured, were made in fourteen days by fourteen (chiefly) of the twenty working members of the party who visited La Charente in 1875. The results of their labours were made conspicuous by the unparalleled collection of drawings brought together by Mr. Sharpe to illustrate his celebrated lecture on the architecture of La Charente last year.* Such a result, and such work as that which produced it are too great, it is to be feared, again to be realised; while the loss of Mr. Sharpe cannot be over-estimated in this matter. However, the lines which the founder of these excursions laid down, will, as far as possible, be followed, and much good work will no doubt be done by those who join the excursions from year to year. The few sketches which we propose to give are taken from some made last year, and may not be without interest just now, although they cannot lay claim to being more than quite holiday work.

An account of the points of interest at Winchester, with an outline of those places visited during the excursion, were given in an article published in the BUILDING NEWS for Aug. 4th last year, given as a prospective review of the excursion; so that little remains to be described here save a few notes on the particular buildings referred to by the accompanying sketches. The two which are selected for publication to-day were made on Aug. 18th, the day arranged in the programme which governed the proceedings, for a visit to Salisbury. Before the duties of the day commenced, an early walk to St. Peter's, Cheese Hill,† Winchester, which lies to the east of the city, resulted in our sketch herewith; the building not being visited by the body of excursionists until the concluding day of the excursion. The chief peculiarity of this church is the square shape of its ground plan, which consists simply of a nave with a south arcade of three arches, a south aisle, and a square tower at the south-east corner, there being no chancel. The length of the nave is 37ft., with a width of 39ft. 8in., including the aisle. The nave arcade is Transitional Norman. The west windows are Decorated, while those of the east and north sides are of Perpendicular work. The tower is of much earlier date, having an interesting small square-headed window next street, of Early English, if not anterior, character. The roofs are covered with tiles, and the upper stage of the tower is tile-hung, and contains three bells. Some ancient open work crest tiles remain on the ridges of the roofs. The font is of Norman date, and is of Petworth marble, like many

* See BUILDING NEWS, June 16th, 23rd, and 30th, 1876.

† Cheesehill, anciently called Chishull or Chusull Street. It is near St. Giles' Hill.

other examples in Hants. The bowl has slightly-sunk circular-beaded panels. We have here also one of the several instances in the county of the use of chalk for somewhat elaborate work. We refer to the two Decorated niches in the south and east walls; they are of very good character, and are interesting examples though defaced. Adjoining the church, and extending on plan half way up the nave on the north side, commencing from the west end, is a house (formerly the residence of Chief Justice Fleming—now for many years the property of the Earle family), possessing the peculiar advantage of direct communication with the church on the chamber floor, by means of a shuttered opening, so that the inmates were able to hear the services from this sort of gallery, so to speak, without going into the church. Several remains may be traced in this house which seem to indicate the existence of some conventual establishment in connection with the church. From the many indications which remain, especially on the north and west sides, it is thought that at some time the church was much altered, probably at the Reformation era, and features, such as windows, built in from other, and not always similar, positions; and this idea is confirmed by Mr. C. R. Pink, architect, of Winchester, to whom we are indebted for our introduction to this church; the view from the west with its foreground of foliage, a branch of the river Itchen forming a base to the picture, with the water-mill and bridge to the left, being pointed out as one of the most "charming bits" in the whole city of Winchester. In a drawing published by the late Owen B. Carter a porch seems to be shown to the entrance; but if this was so, the porch no longer remains. The church was repewed in 1834; the parish school was built in 1840; and the parsonage in 1845. The rectory is valued at £100. Leaving Winchester at 8 o'clock, Salisbury was reached by about 10 a.m. The party first visited the Museum, and examined the fine collection of flint implements, and other varied specimens both of general and local interest, especially the large model in the museum of Stonehenge, which for want of time could not itself be visited. Leaving the museum, an approach was made to the cathedral by way of St. Anne's Gate, an interesting example of a rather late Domestic Gothic gateway, with later additions. This building was illustrated in the BUILDING NEWS from our sketch published Oct. 18th, 1872, when a few particulars were given. Passing the new college buildings, at the entrance to the Close, and then in course of erection by Mr. Butterfield, we at once obtained what Rickman calls "the best general view of a cathedral to be had in all England, displaying the various proportions of this most interesting building to the greatest advantage." Commenced in 1220 and finished in 1258, Salisbury Cathedral exhibits in perfection the Early English style, which attained its highest excellence at that date. The spire is of the time of Edward III. It rises 400ft. above the pavement line, 30ft. above the top of St. Paul's, and only 74ft. below that of Strasburg—the highest cathedral in the world. It was at this spot already referred to, from whence this fine *coup d'œil* of Salisbury Cathedral is obtained, that a friend brought his guest, who had just arrived from town, to enjoy a first view of the building of which he himself was so justly proud; and so careful was the host that the effect of grandeur should be realised at the right time by his London friend that he desired him to close his eyes until he reached the spot. "Now," said the chaperon, "what do you think of that?" "How wonderfully like the cork model I have in London," was the unappreciative reply. This anecdote was recalled to our mind by the equally appreciative and critical remarks on the proportions of the tower and spire by some of those who were with us on the occasion we are now recording. At the Cathedral the party was met by Mr. King, from the office of Sir G. Gilbert Scott, R.A., whose work of restoration here is so well known. All the chief points of interest were alluded to, including the questioned position of the high altar. The restoration of the choir was just on the point of completion, so that the work was seen to advantage. The choir stalls, by Wyatt, we need

hardly say, have been removed, though probably the new doctrine on restoration would have pleaded even their retention, and certainly an example might well have been preserved in the local museum as an historical record. The curious way in which these stalls were enriched with putty crockets and composition ornaments was interesting, however debased and bad they might have been. We are glad to have ourselves preserved a portion of one of these, secured from the debris when the stalls were broken up some few years since. After having visited the vestry and examined the celebrated cope chest (illustrated by Mr. Wm. Burges, in his "Architectural Drawings"), the triforium, roofs, and spire were explored, the system of iron ties and bondings introduced by Sir G. Scott being pointed out and described. A fine view of the surrounding country having been obtained from the spire, attention being drawn to the various churches and points of interest in the landscape by Mr. F. Bath, architect, of Salisbury, the party adjourned to the White Hart Hotel for luncheon, which, after such a morning's work, was readily done justice to, as may easily be imagined. Every one now in the brief time which remained was allowed to follow his own bent on promising to put in an appearance at half-past three for the group photograph, and the "gentle reader" will be lenient in passing judgment upon any work which was done during the interval which preceded such an auspicious event. One incident with regard to the "group" occurred which, had it taken place a moment earlier, would have seriously interfered with the tout ensemble. No sooner had the "artist" said "All right," or the cap put on the camera, than the doors of the portals in which the "group" stood were thrown open, and set the afternoon congregation free. But to return to our sketch in High-street of the Old George Inn. This building is one of the many interesting examples still to be found in Salisbury, and, although not probably quite so well known as some, is not second in interest to any. The other examples referred to may be briefly enumerated as St. Nicholas Hospital, near Harnham Bridge, founded by William Longspee, first Earl of Salisbury, 1227; the Poultry Cross, of sixteenth-century work; the Hall of John Hall in "New Canal," it was built in 1470, and was restored by Mr. Pugin; the Barracks in Brown-street, of the time of Henry VI., has a curious chimney-piece in one of its rooms; the Joiners' Hall, in St. Anne-street, temp. Elizabeth; the Tailors' Hall, in ruins (or was recently), at the end of a passage in Milford-street; and some houses in Minster-street, illustrated in the BUILDING NEWS, Jan. 12, 1877, from drawings by Mr. F. Bath, architect.

The following by way of description of the Old George: In 1412, when John Becket was Mayor of Salisbury, an account was rendered of rents and tenements within the city held under the mayor and commonalty, and among them is the hospiciam called the George Inn, held by Thomas Randolph at the yearly rent of £20. About 1570 the building was let for thirty years at £10 per annum, the tenant doing repairs. The George Inn is mentioned in the will of Alice Meriot, whose first husband, William Teynterer, jun., bequeathed it to the Mayor and Commonalty, as forming the confraternity of St. George, for charitable purposes, and to the inhabitants for their prayers. The executor, William Warmwell, a citizen of note, neglected to fulfil the directions of the will, and Alice, widow of Teynterer, who subsequently married George Meriot, and died in 1406, introduced an English clause into her Latin will, calling attention to the circumstances. It is probable that the inn derived its name from St. George, the patron saint of the corporation guild. The carved work at the entrance is said to be of the time of Edward III. or Richard II., and the woodwork of the George is "chiefly chestnut;" but, not having made a personal examination, we cannot vouch for this. We learn from an inventory of the furniture of the Old George, dated April 9, 1473, that there were thirteen chambers for guests, including the Earl's, the Principal, the Oxford, the Squire's, the Lombard's, the Garret, the Clarendon, &c., &c. There were, besides the tavern or wine cellar, the buttry, the kitchen,

the hostelry and hostler's chamber, and the parlour called the warehouse. The furniture was of the most homely description; the beds, of which there were one, two, and three in a chamber, were classed according to the number of planks which formed the bottom of the bed, and which were from two to five in each bed. The guests appear to have messed together in their respective sleeping rooms, as in each chamber there was the same species of accommodation—viz., a dining table of oak or beech, tressels to support it, and forms evidently adapted to the table. In the "Principal" chamber there was a cupboard. Robert Hungerford, second Lord Moleyns, on his way to join the English army at Blaze, in Guienne, commanded by his relative, the famous Talbot, Earl of Shrewsbury, in 1444, stopped at the George. Pepsys records his stay in 1668; he had "a silken bed and very good diet," as well as a most unwelcome bill of charges, "at which I was mad, and resolved to trouble the mistress about it, and get something for the poor, and come away in that humour."* The oldest portion of the Old George is still preserved, though the original purpose of the house has been changed. A carving knife of the early part of the fifteenth century, bearing the effigy of a king, was discovered during recent alterations, and is now deposited in the Salisbury Museum. The party returned to Winchester by the train leaving Salisbury at 4.25.

M. B. A.

PUBLIC OFFICES IN LONDON.

THE Select Committee of the House of Commons, appointed to inquire into the annual expenditure on public offices and buildings, and to see whether the adoption of a more comprehensive plan for the extension and improvement of the public buildings would not be more economical and advantageous than the present system, has reported in the affirmative. Three plans have been submitted to the committee for the concentration of certain public departments. The first plan is that of Sir Henry Hunt, the consulting surveyor to the Office of Works. He proposes to purchase all the block of buildings bounded by Parliament-street on the east, St. James's-park on the west, Great George-street on the south, and Charles-street on the north. This contains 133,000 superficial feet of building area, and the estimated cost of the ground amounts to £1,300,000; on this block Sir Henry Hunt provides accommodation for the War Office, and the Admiralty, and the Council Office; he proposes to remove the old buildings in Downing-street, and to erect houses fronting the Park for the First Lord of the Treasury and the Chancellor of the Exchequer; to add a story to the Treasury offices, to place the Board of Trade between them and the Horse Guards; to retain the Horse Guards, and to place the Office of Works and the Office of Woods between the Horse Guards and the present Admiralty, and thus to leave the existing Admiralty building at the disposal of the Government. Sir Henry Hunt stated to the committee that he calculated the whole expense of his scheme, including his Great George-street site, at two millions and a half, and that he further estimated that it would set free, and render available for sale, property belonging to the Government, including the existing Admiralty building, as well as release the houses which are now hired, represented by a capital value of a million. This plan, Sir Henry Hunt said, does not provide for the Civil Service Commission, nor for temporary commissions. It appears to the committee undesirable to add a story to the existing Treasury block of buildings.

Another plan was submitted to the committee by Mr. Mitford, the permanent secretary to the Board of Works. The witness proposes that the public offices should be placed on the west side of Charing-cross and Parliament-street, and that incidentally to this scheme the narrow part of Charing-cross should be widened, and the Mall extended into Charing-cross at the point where Messrs. Drummond's bank now stands. On the park side the Horse Guards would form the centre of a group of public buildings, and there would be no encroachment on the Parade.

* See Diary, Vol. II., p. 257.

For carrying out this scheme it would be necessary for the Government to acquire the whole of the Crown property and private property which lies between the corner of Spring-gardens and Cockspur-street and the present Admiralty, together with Dover House, which belongs to the Crown, and a portion of the block bordered by Great George-street to the south, and Parliament-street to the east, setting back Parliament-street to the line of the new Home Office. From a statement which appears in the appendix it will be seen that Sir Henry Hunt estimates the probable cost of Mr. Mitford's scheme at three-quarters of a million in excess of that of his own. Mr. Mitford proposes by his plan to obtain an additional building area of 25 per cent. over that of Sir Henry Hunt.

The third plan is that produced by Mr. Cates, one of the surveyors of the Office of Woods, and includes one side of Whitehall-place and the houses in Whitehall-gardens up to Montagu House. It makes use of the land known as the Fife House site, the vacant space of ground lying between the public gardens on the Embankment to the south of Whitehall-place and to the west of the public gardens of the Embankment. Here it is proposed to place the War Office, the Admiralty, and most of the other departments provided for in Sir Henry Hunt's plan. Mr. Cates estimates the cost of this site at £850,000.

The committee strongly insist on the expediency of the Government losing no time in proposing some plan by which the evils complained of may be remedied. It is their opinion that delay will lead to greater expense in the future, and that immediate action is demanded for the efficiency and comfort of the public departments and the dignity of the country.

LECTURES ON ANCIENT ROME.

THREE very interesting lectures, illustrated by photographs shown by means of the oxy-hydrogen limelight, were delivered by Mr. John Henry Parker, C.B., F.S.A., &c., at the Rooms of the Institute of British Architects, on Tuesday, Wednesday, and Thursday week, to select audiences. The proceeds are to go towards the Roman Exploration Fund—a work in which Mr. Parker has for years taken an active interest. The subjects of these lectures were the four walls and thirty-seven gates of Rome, the Forum Romanum, Via Sacra, and Colosseum, and the tombs and catacombs. Some time ago we gave a short account of Mr. Parker's published works on these subjects, one being the "Forum Romanum." What the author in those works has detailed and illustrated with such minuteness was explained to the audiences at Conduit-street with the advantage of magnified photographic representations of the principal portions of the Roman remains and excavations. Mr. Parker's second lecture was, perhaps, the most interesting from an architectural point of view, and we may just glance at some of the leading objects illustrated on Wednesday afternoon week. That lecture was an imaginary walk through the Forum Romanum, the Via Sacra, and the Colosseum. Commencing at the north end of the Forum, Mr. Parker described what he has called the Capitolium, which included the principal public offices of the municipality in the time of the Kings and of the Republic. It is now called the "Municipium" on this account. Under the building, in the basement, were the *Ærarium* or treasury, the *Tabularium* or Record Office, and the *Senaculum* or Senate-house. It stands on the south slope of the Hill of Saturn. The last-named offices were partly cut out of the rock, and portions of the excavated parts were illustrated. The Senate-house or *Curia* was on the level of the third floor, behind and above the *Tabularium*. The doorway of the *Curia* was the south-east corner, 20ft. above the market-place level. At this point, on the top of the flight of steps, the herald on certain occasions made proclamations to the people below. Mr. Parker contends that the Senate-house could not have been the Temple of Concord as believed by some, because it was the vestibule of it. He says the space was not large enough, and that it is more probable that the Senate assembled for debate in the great building behind the temple. He also shows

that, as the upper part of this great public structure was of wood, and the lower of stone, the latter would escape destruction by fire. The west end is of tufa of the time of the Tarquins; the east end of travertine of the early Empire, and belongs to the rebuilding after the great fire. The general view of the Forum, taken from the Palatine Hill, is an admirable key to the excavations. The photographs shown by the limelight included the half-buried columns of the Temple of Saturn as it appeared before the excavations in 1810. At that time it was named the Temple of Jupiter Tonans. The basement of this structure, showing the circular doorway of the *Ærarium*, with its massive walls of squared masonry, and the moulded plinth of the podium, were admirably indicated; so also were excavations of portico of the *Dii Censentes* (household gods), excavated in 1835, with its colonnade of light composite columns, between which were the bronze statues of the gods. In front is the well-known Ionic temple, generally called *Saturu's*, though, by Mr. Parker, *Vespasian's*. No traces of vaults exist under this temple, and the temple is described as having been rebuilt in the third century. In going on, the *Miliarium Aureum* or gilt mile-stone, in the exact centre of old Rome, and the Arch of *Septimus Severus* were illustrated; the column of *Phocas* (the nameless column of *Byron*); the basement of the Temple of *Vesta*; the marble screens in the *Comitium*, found in 1872, showing a procession carrying tablets, probably of citizens about to burn the bonds of the public debt; and also a magistrate, seated on a curule, together with the long flat panel from the Arch of *Constantine*. Other views shown were the *Basilica Julii*; the celebrated columns of the Temple of *Castor and Pollux*; the Church of *St. Maria Liberatrice*; a part of the *Cloaca Maxima*; Temple of *Constantine*, with its magnificent side vaults, &c.

The most interesting part of Mr. Parker's illustrative lecture was the description of the Colosseum. Photographs of the superstructure—external and internal—the work of the *Flavian Emperors*, were first exhibited, in which the magnificent arcades of *Travertine*, built against the outer sides of the galleries, were admirably depicted. The inner tufa walls, with brick facings; the wonderful substructures of different ages, recently excavated at Mr. Parker's suggestion by *Signor Rosa*; the dens for wild animals; the gulf, canals for water, the lifts for animals and men, the brick arches, the grooved walls, the vessels, the network of passages, were all shown in these photographs. The author maintains that the substructures are earlier than the time of the *Flavian Emperors*, and that probably part of them belongs to the great theatre of *Scaurus*, the stepson of *Sylla*, which held 80,000 people. A section exhibited the means by which the spectators were covered by the movable awnings over the galleries. Corbels for masts or poles appear round the upper story of the outer wall; upon these the poles rested which supported the awnings. The cords were so strong that it is recorded an elephant was trained to walk on them with a Roman knight on his back! It is also recorded that naval fights even took place in the canals of water, which were parallel to each other, and ran down the centre of the arena. These were covered by boards on other occasions.

THE PROPOSED CANNING COLLEGE, LUCKNOW.

SOME dissatisfaction appears to have been expressed among the competitors at the recent award that has been made in reference to the proposed college at Lucknow. From what we hear, the premediated design is by a native competitor, Mr. *Tockeram*, a draughtsman in the chief engineer's office, *Rajpootam State Railway*. A premium of £250 (in English money) has been awarded for his design, and the plan, elevation, and details are now before us. It certainly appears to us the committee of selection have not exercised the best taste. The photographic views sent in—taken from the "*Roorkee Treatise on Indian Engineering, 1876*"—shows an elevation reminding us of some of the earlier imitations of Oriental de-

signs. The centre of two stories, surmounted by a dome of square form, and flanked by spindling-angle minarets, has a low one-story wing on each side, terminated by a cupola of the usual Indian Saracenic type. The features of the building are mosque-like, but the detail is a mixture of poor classical with Oriental forms. The centre portion may be roughly compared to a very inferior imitation of the *Alhambra Palace*, in *Leicester-square*. The plan has a large examination hall in front (100ft. by 43ft.), forming the centre block, on one side of which are the library, principal's rooms; and, on the other, the professors', opening into one another. Behind a longitudinal corridor, with a porch at each extremity, opens upon a suite of seven class-rooms, each 24ft. 8in. by 35ft. A verandah, or arcade, surrounds the entire building (the corners of which are bath-rooms), the surrounding apartments all opening upon it. The main entrance is reached by a flight of steps from a covered porch in front. The design is intended to be constructed in brick and lime masonry, plastered internally, and externally picked out in colour. The entrance arches, decorated with a kind of running foliage over the members, and abutting against the weak post-like angle minarets, and the single segment arch above, inclosing three windows similarly decorated with leafage along the top, display ignorance of architectural design. Another design before us, "*Excelsior*," by a firm of *Bombay architects* (Mr. *F. W. Stevens* and Mr. *J. Adams*), has rather confirmed our conclusion that the committee have not displayed the best taste in their decision. The authors adopt a \perp -shaped plan, in which the examination hall is made an octagonal structure, behind the front block, and connected with it by a lobby. At the back of this hall is the library (60ft. by 30ft.), surrounded by a corridor with a carriage porch. The front building has a central hall and staircase, with side wings devoted to the professors' rooms, and two large class-rooms on each side; on the upper plan the class-rooms are repeated. An arcaded corridor surrounds the whole building, and the front is well broken by recessed portions, which have flights of steps. While there is more economy and condensation in the premediated plan, we are bound to say it is defective in the communication between the professors' rooms and class-rooms, and that the former are not central enough. The native professors' room is not lighted apparently. In external design, "*Excelsior*" exhibits a reasonable treatment of the local material, and that very essential feature of tropical architecture, the verandah. The design displays a European knowledge of style, in which brick and lime masonry are the principal materials used. The work was intended to be pointed externally, and plastered internally, with cornices, dressings, arches, parapets, &c., in cut white sandstone, procurable near *Lucknow*. The lower arcade has horse-shoe and pointed arches of Saracenic form, the *voussoirs* being of brick and stone alternately. Above these arches in the centre portion is a corbelled balconette projecting from a second range of pointed arches, with sub-arches and pierced heads of local stone. The arches of this story, in the wings, are cusped. The entrance is pronounced by circular turrets, capped with domes. The wings are crowned by domes of octagon shape, covered with coloured *Mooltan* tiles in a reticulated pattern, and the octagon examination hall is surmounted by the highest dome, of bulbous shape, resting upon a pierced drum. Angle turrets, with cupolas, accentuate the main angles of the structure. The estimate of the building was 120,000 rupees, or £12,000.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE members and friends of this society made their annual excursion on Saturday, the localities selected for exploration being *Whalley* and *Stonyhurst*. The party left the *Liverpool Exchange Station* at nine o'clock, and arrived at *Blackburn* soon after ten. Having a little time to wait, they walked into the town and inspected the new library and museum and the Exchange. They then resumed their journey on the railway, and arrived at *Whalley* at eleven o'clock, and proceeding to the abbey viewed the ruins. Attention was

next directed to the parish church, in the vicinity of the abbey. Three crosses in the churchyard, apparently of Saxon origin, were minutely inspected, and their date and origin discussed. The party next proceeded by conveyance to *Stonyhurst*. On the way a call was made at *Mitton Church*, the date of which is believed to be earlier than 1593. Leaving *Mitton*, the party soon arrived at *Stonyhurst*, where, by the permission of the rector, they were shown over the college by the *Rev. Mr. Lucas*. The inspection lasted more than an hour and a half, but so numerous were the objects of interest that only a superficial idea of them could be gained in the time. The libraries, with their collection of antique and illuminated books, the sculpture, and the paintings of the secular portions of the college, together with the artistic decorations of the religious apartments of the edifice—more especially the *Lady chapel*—won universal admiration. Works are in progress for enlarging the college, and the extent and nature of the enlargement were explained to the visitors. The party returned to *Whalley*, and, at five o'clock, dined together at the *Swan Hotel*. Mr. *J. M. Hay* (president of the society) occupied the chair, and Mr. *James Montgomery* (treasurer) the vice-chair. The toasts, after dinner, included "The President," proposed by Mr. *Montgomery*. The President, in responding, said: In thinking of what they had seen that day, the mind was carried to a period of English history and a phase of English society which had for ever passed away, and it was impossible to revive it. The whole formation of monastic institutions was a mistake. It originated from a grand and noble motive, but the point of departure, as the French would say, seemed to be a mistake. In our large towns and cities there were dark spots and places which ought to be swept away, that the pure air and light of heaven might be let in. It was the architect's mission to do that, and in doing it he became the truest missionary, or at least the handmaid of the missionary. That appeared to him to be the truest Christian philanthropy, and the whole system of monastic institutions was one that was false from the very commencement. However, it was not with those eyes that they had looked upon the old abbey they had seen. They had looked upon it more as architects and archaeologists. It was a genuine structure; the hand of the restorer had never been laid upon it, and what they did see was the genuine work of men who lived 500 years ago. It was also valuable as a link of that grand style which extended from the *Norman Conquest* down to the period of the Reformation. They had been interested in the churches they had seen, and also in *Stonyhurst College*. The contents of some of the apartments there would have permitted them to have spent a very much longer time. He must say he had looked at it also with another kind of interest—the association with that precious vagabond—that "nobleman who was now languishing in a felon's cell," and who attempted to wrest from the rightful owners the lands and title of a noble family. Mr. *Montgomery* proposed the health of Mr. *Joseph Boulton*, and alluded to the time which Mr. *Boulton* had devoted to the interests of the society. Mr. *Boulton*, in acknowledging the toast, said he regarded the society as one of very great importance to the profession, without which there would be no opportunities of meeting each other as merchants and brokers did on 'Change. The society was also desirable for checking any practices which might come into existence. They all knew that in other businesses there were persons who accepted inducements for recommending clients, and they had reason to believe that there were architects who accepted such inducements. He believed that when an architect recommended any particular course to his client he should be unbiassed in his judgment, and that his recommendation should be in the honest conviction that the person or thing recommended was the best. He considered that no architect could afford to work for 2½ per cent. in the ordinary occupation of the profession, and that if an architect did agree to work for that commission he made up a part of it, though not perhaps the whole, in other ways. Dinner over the party returned to *Liverpool*, where they arrived at eleven o'clock.

THE LATE MR. JOHN WIMBLE.

WE alluded a fortnight since to the death of Mr. John Wimble, of Queen Victoria-street, which unhappily terminated prematurely a professional career of considerable promise. Mr. Wimble, after completing his education at Tunbridge School, was under articles to Messrs. Whichcord and Son, of Maidstone, his native town, and on the expiration of these at once entered into business in London as an architect and surveyor, and by his energy and soundness of judgment soon gained the confidence of a valuable and influential connection.

Although dying at such an early age, the deceased gentleman had acquired a large experience, and unusually accurate judgment of the capabilities of City property, and had been regarded for many years as a prominent authority upon the development and adaptation of all kinds of commercial premises. Indeed, it is probable that during the last ten years he had carried out more work of this kind than any other member of the profession.

The following are among his principal works:—The block of offices at the corner of Gresham-street and Coleman-street; the Peninsular and Oriental Steam Company, West-end offices, Cockspur-street; Messrs. Boosey's premises, Regent-street; residential chambers, Ryder-street, St. James's; Nos. 59, 60, and 61, Haymarket; the premises lately occupied by the *Echo* newspaper in Ludgate-circus; London Salvage Corps stations, Watling and Queen-streets, E.C., and the Commercial-road; the corner block of warehouses at the juncture of Fenchurch with Leadenhall-street; Mildmay-chambers, Bishopsgate-street, covering the site of the famous Old Four Swans Tavern; various works to the Royal St. Anne's Society at Streatham, including the new Albert wing; the whole of Dyer's-buildings, Holborn; premises for Messrs. Mather, Farringdon-road, North-street Church, Brighton; the Countess of Huntingdon's chapel, Tunbridge Wells; Sittingbourne Cemetery; and many warehouse and office buildings in Queen Victoria-street and Southwark-street.

During his later practice Mr. Wimble was frequently retained upon compensation cases by the City authorities, the Metropolitan Board of Works, and the School Board for London—more especially in those relating to the Northumberland-avenue, and to the widening of the Poultry.

Mr. Wimble had been suffering for nearly a year from a serious illness, which, however, till within 48 hours of his death gave some promise of yielding to the influence of quiet and rest. By a large circle of professional and private friends his loss will be deeply felt, for few men were held in higher estimation. His practice will be continued by his brother and partner, Mr. William Wimble.

THE DIFFERENTIATING WASTE-WATER METER SYSTEM.

A LITTLE pamphlet now before us, published by the Waste-Water Meter Company, of Liverpool, points out the great advantages arising from a meter such as that invented by Mr. G. F. Deacon, C.E., engineer to the Liverpool Corporation. Our readers probably are aware that the Liverpool water supply has been changed from a restricted intermittent to an unrestricted constant system. This change has been effected with great benefits; waste has been reduced to such a degree that the municipality is said to have emerged from a state of poverty to abundant wealth. Mr. Deacon's meter system was introduced in 1873. At that time the intermittent service supply for domestic use, hotels, warehouses, offices, and shops, was about 22 gallons per head per diem, while under constant service the quantity was 31 gallons. Before the end of 1875 it is recorded "the waste had been so far checked by the new system that a constant supply was given, and the quantity taken is now only about 15 gallons per head per day." Thus a saving of more than half the former supply has been made. The money value estimated out of this saving is £40,000 per annum, the population being 656,000. At Glasgow Mr. Gale, C.E., estimates the saving to be still greater, or more than 25 gallons per head per

day, and the authorities are about to extend the meter system. To those not acquainted with Mr. Deacon's meter we would explain that it records on a diagram the rate of flow at each instant, and distinguishes the water used from that wasted—a valuable feature not found in other meters. The apparatus is placed under the footway as near a line of service as possible; pipes are laid to it from the main, so that all the water may pass through the meter before being distributed. A fac-simile of diagrams from a fire-ucter on a main supplying a district of 2,176 persons is shown. The sheet is ruled horizontally into a series of lines representing gallons per hour, and vertically into lines indicating from noon to noon, or 24 hours. When water is being drawn off for use, the rate of flow being variable, it is shown by irregular vertical lines from noon to 11 p.m., and from 5 a.m. to noon. When waste takes place, the flow being uniform, it is shown by horizontal lines from 2 to 5 a.m., broken only by occasional vertical lines caused by persons drawing water during the night. The filling of cisterns through ball taps is distinguished by sloping lines as from 11 p.m. to 2 a.m. The apparatus is a very ingenious application of the piston principle. It consists of a conical-shaped tube or gauge, in which a disc equal to the smallest or top diameter of gauge-tube works, suspended from a fine silver wire, which passes watertight through a small aperture to an upper chamber, and over a pulley, its end having a weight attached. To the wire is a cross-head carrying a tracer, which rises and falls with the disc as the latter is acted on by the weight or the flow of water through the tube. This vertical action, in conjunction with the movement of the paper, which revolves by clock-work round a vertical cylinder, produces the diagram. The whole is enclosed in a small east-iron box with hinged lid, which is let into the footway. Thus a flow of water presses the disc down, and the tracer describes a vertical line; but if waste takes place the element of time, or the lateral movement of the paper at the same time, produces a horizontal line, or an oblique one, on the paper, if the movements are compounded. It is found that the waste discovered by a given number of men in a certain time by this system is three or four times that detected in the same district by the old system. We commend the pamphlet to all water-consumers and companies.

SHOGUN AND MIKADO; OR, NIKKO AND ITS WOOD-CARVINGS.

"NEVER say *kekko* (beautiful) till you have seen Nikko," is the Japanese proverb fully justified by the splendid scenery in which are placed the shrines of the Shogun Iyemitsu and his grandfather. "No scenery in the world," says a recent visitor, Mr. W. C. Borlase, "surpasses in beauty the gleu down which from the sacred mountain a torrent rushes over its granite bed. . . . See it, if you can, in the early light of morning, when the hazy yellow sky is just changing into blue, and choose the season when the underwood of azaleas is in flower, and the hillsides are a mass of pink, dotted here and there with dark fir-clumps." Cross the bridge which spans this gleu, and you come to flights of steps and terraces, leading zig-zag fashion through courtyards lined with temples, each more elaborate than the last, until you reach the top of the hill on which stands the tomb. Many of the temples, as well as the palace formerly occupied by the Shogun during his yearly visit to his ancestor's shrine, have been burnt to the ground by order of the Government; but enough remains to prove the good taste and magnificence of these "Mayors of the Palace," to whom Japan owes her art-culture. Bronze lanterns forty feet high, granite lavers, huge candelabra, and incense-burners and vases, all in bronze, adorn the grounds. But the gem of all is the wood-carving and brass-work of the screen round the great court. "It is," says Mr. Borlase, "divided into compartments, each one filled with a choice subject of birds or flowers, so exquisitely treated, and coloured with so much delicacy and taste that it is hard to realise they are of native workmanship, until we remember that Europe at that time possessed nothing to compare with them. Harder still is it to believe that we are gazing at them in no palace or exhibition of fine arts, but in the centre of a damp-dark forest, where no roof shelters them, and, worse than all, no pious hands save them from decay." The central gate of this screen is described as a marvel of workmanship, full of carving—groups of children at play, fighting dragons, Chinese sages—as spirited as they are elaborate. All this, which, in the Shogun's or Tycoon's day, was yearly painted and

gilt by the best artists of the capital, is now rotting away in a cryptomeria forest, and must ere long be irreparably ruined. Mr. Borlase, in his little work on "Nipho and its Antiquities," hopes that "the liberal views of the Mikado's Government will be extended to preserve a work which is unmatched in the world." We cannot, however, expect much from a Government which has sold nearly all the fine bronzes in Buddhist temples for old metal, and which would have broken up and sold the Dai-Buts (Great Buddha), a grand bronze figure 64ft. high, but for the strong representations of the foreign consuls. If the Nikko carvings are to be preserved, the same kind of pressure which saved the Dai-Buts must be put on the Mikado's council; for everything at Nikko belongs to the fallen dynasty, and therefore reminds the nation of the 700 years' tutelage in which the Shoguns kept the Mikados. Hence, while stone arrows and spear-heads, leaf-shaped swords (like the Irish), as well as all that pertains to "puro Shintoism," find a place in the South Kensington Museum, the triptychs, and statues, and lamps and other fittings of Buddhist temples are the prey of every wandering dealer, and the exquisite carvings of Nikko are left out in the cold. They are the work of "the usurpers," and therefore the restored dynasty wishes them to be forgotten. The feeling is natural; but such meanness is surely inconsistent with the grand pretensions of the restored dynasty. If the Japanese rulers have grown civilised, now that they have taken to ruin native manufactures by wearing broadcloth and felt hats, let them show that no petty spite will make them forget their public spirit.—*Echo*.

CHIPS.

The Corporation of Tyemouth are about to erect extensive ice stores in connection with the Fish Market at the Low Lights. The proposed building, which is the commencement of a more extensive scheme, has been designed by Mr. J. P. Spencer, C.E. The contracts have been let to Mr. R. Bolton, of North Shields.

On June 27 the memorial stone of the Alma-street Schools, Aston, was laid. The buildings will be Gothic in design, and afford accommodation for 280 boys, 220 girls, and 400 infants. The total cost amounts to £12,897.

A memorial cross, in memory of the late Sir John Taylor Coleridge, has been erected at the new east-end entrance to the churchyard of St. Mary, Ottery. The cross stands about 12ft. high, and measures round the base below between 5 and 6ft. It is a solid piece of granite weighing from four to five tons. The design is by Mr. George Wollaston, of London. The cost will amount to about £150.

A printers' wayz-goose is not, as a rule, distinguished for the intellectual enjoyment provided, but the staff of the *Exeter and Plymouth Gazette* last Saturday week somewhat improved on the usual programme by organising an excursion for the purpose of visiting some of the adjacent places of interest. St. Saviour's Church, Dartmouth, Totnes Church, Berry Pomeroy Castle and church were successively examined, and the party dined together at Totnes in the evening.

The subjects for discussion in the Art Department of the approaching Congress at Aberdeen of the Social Science Association, are—1. What principles should govern the restoration of ancient buildings, or their preservation as memorials? 2. Is our modern system of art competition favourable or unfavourable to art progress? 3. How can art be best introduced into the houses of persons of limited income?

The memorial stone of a new church now being erected at Beswick was laid on Monday by the Bishop of Manchester. The new building, which is to be dedicated to St. Mary, will contain seats for 600 persons. The style is English Decorated. The architects are Messrs. Paley and Austin, Lancaster; and the contractors Messrs. Cordingley and Stopford, builders, of Manchester. The amount of the contract is £8,700.

The Boston guardians are about to erect a new workhouse infirmary from plans by Mr. Wheeler, architect. Last week the tender of Messrs. Harrison and Leng, of Boston, amounting to £734 10s., was accepted for the carrying out of the work.

Mr. Woods, sanitary inspector of St. Helens, was last week elected surveyor to the Penrith Local Board of Health, in succession to Mr. Todd, resigned. There were 12 applicants for the office.

Mr. John Somes Story, late engineer of the Midland Railway Company, has been appointed county surveyor for Derbyshire. The salary is £100 per annum, to cover all expenses.

The foundation stone of a new Board School was laid at Holden Colliery on Saturday. Mr. J. J. Lish, of Newcastle, is the architect, and the building will hold 660 children, at a cost of £1,000.

A new Baptist chapel in Marshall street, Edinburgh, was opened last Friday. The building has been erected from designs by Messrs. Thornton, Shiells, and Thomson, of Edinburgh. The style is Lombardic, of a severe type, and accommodation is provided for 650 people at a cost of £1,000.

CHURCH OF ST. LAWRENCE, NORTHAMPTON—"BUILDING NEWS" CLUB DESIGNS FOR CHIMNEY STACKS—PARSONAGE AT SUMMERTOWN—VILLA AT LEIGH WOOD, CLIFTON—CHURCH OF ST. PETER, WINCHESTER—THE OLD GEORGE HOTEL, SALISBURY—RESIDENCE AT BOWDEN, CHESHIRE.

OUR LITHOGRAPHIC ILLUSTRATIONS.

VILLA RESIDENCE, LEIGH WOODS, CLIFTON.

THIS house is now being erected for Dr. Wheeler, of London, from the design of Mr. Henry Shaw, architect, of 25, New Broad-street, E.C., by Messrs. Stephens and Baston, of Bristol, for £1,362. The walls up to plinth are of local stone, and above same to first floor of red brick, built hollow; the chimney shafts also are red brick; the gables and upper portions being in half timber-work. It is roofed in with Bridgewater tiles.

SUMMERTOWN PARSONAGE.

THIS house is shortly about to be erected. From the nature of the site, which has a main road at the front and back, and a third road at the side, the design of the elevations has had to be considered from several points of view. The hall is a large room, intended to be used partly as a parish room. The walls will be built of local bricks, and the roof is to be covered with tiles. The architect is Mr. John D. Sedding, of 18, Charlotte-street, Bedford-square, London. Our illustration was taken from the architect's drawing, now at the Royal Academy Exhibition.

ST. LAWRENCE'S CHURCH, NORTHAMPTON.

THIS design, which we illustrate to-day from drawings now on the walls of the Royal Academy, was selected in an open competition of ninety-one architects, Mr. Ewan Christian being the arbitrator. The aim of the architects has been to produce a town church of simple detail and inexpensive materials, which shall depend for any effect it may possess upon the breadth of treatment and general massive proportions. The plan consists of a wide nave and chancel, with narrow aisles, used only as passages, the bulk of the congregation being seated in the nave. There is also a chapel on the south side of the chancel, for week-day services, available also for use with the rest of the church. Additional seats are obtained behind the metal screens shown in the view, which separate the choir from the passages for communicants returning to their seats, for the general congregation, or available for an increased choir on special occasions. The contractor for the work is Mr. J. Watkin, of Northampton; Mr. E. Wickham has charge of the erection as clerk of the works; Mr. Alfred W. N. Burder and Mr. Arthur Baker, of 14, York-buildings, Adelphi, are the joint architects.

LEAVES FROM A SKETCH-BOOK.

THE Church of St. Peter, Winchester, and the Old George Hotel, at Salisbury, will be found described in the article, "Leaves from a Sketch-book," on p. 46.

BUILDING NEWS DESIGNING CLUB—
A CHIMNEY STACK.

THIS week we publish the selected designs for this subject. "Début" was placed first in order of merit; "B," in a circle, came second; "Mechlin," third; and "St. Lucy," fourth. For our criticism the reader is referred to the review.

SCHOOLS OF ART.

FEMALE SCHOOL OF ART.—The annual distribution of prizes to students in connection with this institution took place on Wednesday week in the theatre of the Museum of Geology, Jernyn-street. The report stated that the success of the students during the past year had been of a very satisfactory character, her Majesty having given an extra special mark of her approbation by granting an additional sum of £10 to the Queen's Scholarship, and by purchasing two works from the selection sent for her inspection. The committee had again to congratulate Miss Gann on having been awarded to her by the Lords of the Committee of Education a premium of £10, her name being fourth on the list of 138 competing schools. In the first division, national awards, five have been won by the students of this school. In the second division, local awards, the Queen's gold medal was apportioned to Ida Lovering, and it was recommended that Alice Hanslip should retain the Queen's Scholarship, value £30, for another year. The Gilchrist Scholarship of £50 was awarded to Miss Mary Ann Burney, student of the Female School of Art, Queen-square, Bloomsbury. The committee had also to receive the generous gifts of £10 10s. from Lord Hatherly, and of £10 10s. from Mr. Henry Bicknell, which had enabled him to sanction three scholarships for this year.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.—The annual country congress of this body has been fixed for Llangollen for the week commencing the 27th proximo, and the arrangements, so far as they can be made beforehand, have been completed. The meeting is held under the presidency of Sir Watkin Williams Wynn, whose seat, Wynnstay, is not far from the locality of the gathering. The opening meeting and dinner will be held on Monday, the 27th, and there will be excursions every day in the week, and meetings at night for the reading of papers. Among the places set down to be visited are Offa's Dyke, Denbigh Castle, Chirk Castle, Castell Dinas Bran, Valle Crucis Abbey, Elyseye's Pillar, the Gaer, an ancient British encampment, site of Owen Glendower's house, an ancient stone castle, and several ancient churches at Dolgelly, Denbigh, Wrexham, and other places.

COMPETITIONS.

HINDLEY CEMETERY COMPETITION.—In the recent competition for cemetery chapels, and for the laying out of the ground, the Burial Board have awarded the first premium to Mr. Geo. Heaton, of Wigan (the surveyor to the board); the second to Mr. R. K. Freeman, of Bolton-le-Moors; and the third to Messrs. Garside and Johnson, of Southport.

SCARBOROUGH.—On Monday a committee of the Scarborough Cliff Bridge Company decided the premiums for the plans sent in on the 20th of March for the renovation or reconstruction of the Spa-buildings, consequent on the fire of the last season, and the need of more promenading space. Some 26 plans for renovation were sent in, out of which 4 were, with the assistance of Mr. E. P. C. Cockerill, of the Royal Institute of British Architects, selected to send in an alternative scheme of reconstruction. The first prize of £300 (to be merged in the commission) was awarded to Messrs. Verity and Hunt, of 27, Regent-street, London, who, in their account of the reconstruction scheme which the committee decides to recommend for adoption in preference to the lesser plan of renovation, give the following summary of the accommodation:—It

embraces a grand hall for promenade in dull weather, concerts, and other large gatherings. A smaller, or floral hall, subsidiary to the former, which may serve for a crush room or lounge, small concerts, or theatrical representations, and a variety of other purposes. Largely increased promenade space on the roofs, the terraces, and parade, for the greater part within hearing of the band. A café for gentlemen on the higher level, where smoking might be permitted, and where it could not interfere with the comfort of others. A reading room or retreat for ladies, to which might be affiliated a lending library. An extensive refreshment buffet, with a properly arranged kitchen department. Every convenience for ladies, gentlemen, and children. A grand central well-lighted vestibule and staircase, giving easy communication to all parts of the establishment. Caretaker's quarters, and all necessary offices, and all the requisite stores for seats, coals, wood, earth for closets, gardeners' tools, &c. The other three architects whose plans had been selected for inspection, and who received £60 each, are Mr. George Dale Oliver, of Newcastle-on-Tyne; Messrs. Gibson and Son, Malton; and Mr. W. Watson, of Wakefield, formerly of Scarborough. The cost of the work, it is understood, should not exceed £40,000. We are promised the drawing of the successful design by the architects, and shall shortly give an illustration of the same.

THE following are the special questions selected for discussion by the Art Department at the forthcoming Social Science Congress at Aberdeen:—1. What principles should govern the restoration of ancient buildings, or their preservation as memorials? 2. Is our modern system of art competition favourable or unfavourable to art-progress? 3. How can art be best introduced into the houses of persons of limited income? Papers volunteered on other subjects, coming within the scope of the department, will be read and discussed.

MR. WALTER, M.P., opened an art loan exhibition at Wokingham, on Wednesday, and spoke of the advantages of such a collection in educating the tastes of the working classes. An art collection, he believed, had the same effect on the taste of those who took an interest in it as the cultivation of their minds in early life by the study of the best models of English composition, both of music and poetry, and would protect them against the sickening rubbish of which so much was poured out in the present day; and the chief object of that splendid exhibition, though some might consider it useless in a small country town, was to improve and develop the taste of the people. He did not think that, however much Englishmen had the power of appreciating and imitating the works of Greece and Rome, and also of France and other countries, art was the line in which they themselves were specially qualified to excel. They rather occupied the position of Rome in the matter. They had still higher and nobler duties to perform.

THE Common Council of London has again altered its mind, and resolved to authorise the Bridge House Committee to take the necessary steps to obtain the requisite Parliamentary powers for raising funds to widen the present London-bridge. Mr. Deputy Lawrence Taylor pointed out what every one in his right senses knows very well that if they widened the bridge they brought a greater amount of traffic upon it; but if they could get rid of the congestion at the north end, then to widen the bridge might be a desirable thing; but it was the traffic at that particular point which continually blocked up the roadway. If the citizens of London are contented to have their money frittered away in useless endeavours to obtain plans to carry out impracticable ideas, and meanwhile to allow the heart of the capital to be blocked by traffic which has no business there, no one else has much right to complain. As things go at present, the Corporation of London is likely to be reformed before a new bridge is built or the present one widened, and when the incompetence and hesitation of the present Common Council is considered no one need much regret the probability.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XII.

A Covered Carriage Entrance.

THE designs we have elicited for this subject do not come up to our expectations, and only two realise the idea of a covered park entrance, or *porte cochère*. The conditions required a covered carriage entrance 10ft. wide, with a two-roomed lodge attached. "Fleur-de-lis" sends the best attempt. The lodge and entrance are united, and are conceived in a free Renaissance, picturesquely handled. A circular turret stair adds a very characteristic feature to the lodge, and this is placed between the living-room (12ft. x 10ft.) and the scullery (projecting exteriorly). The living-room has an entrance from the foot passage-way of gateway, and is lighted by one window in front of too wide proportion, and two narrow lights on the park side. Between the latter is a fire-place, with a kitchen range. A door leads direct into the scullery, which is narrow and kept low. The author has pleasingly finished his turret at the top with a curvilinear roof of ogee flexure, with a belfry underneath it, in the shape of a series of panels filled with grilles. At the side, the bedroom has a dormer window breaking out from a pyramidal roof, the corners of which, together with the attic, are slightly splayed, forming an irregular octagon on plan. We doubt the effect of this in perspective, particularly when the angles of the lower square part of the lodge are seen protruding beyond the attic walls at the corners. We should, also, have preferred the stone archway without the hipped roof over it, and the appearance of the parallel ends of roof would not be very satisfactory. The author groins the interior in pitch pine; and the other materials proposed are, for the wall, stone; for the roofs, brinded tiles; and wrought iron gates. "Début" is a composition far more simple, more original in conception, and pleasingly handled. The carriage-way consists of four plain piers treated as pilasters, which support a simple flat roof, with gabled ends placed transversely. The entrance is joined by a covered passage-way (in which are the side gates) to the lodge, which is of one story, and compactly arranged in a square, with a high pyramidal roof, the chimney being carried up in the centre. There is a severe French feeling displayed in the design, while the carriage entrance may be almost called Schinkeleyesque in detail. The author gives a sketch perspective of the composition, and shows some well-designed wrought iron gates. At a considerable distance from the last in point of merit of design is "J'Espere." But for the careful drawing, this design has little claim to notice. The author places his rooms on one floor, and these are unnecessarily large and not well proportioned, and the bedroom is without a fire-place. Exteriorly we have a range of three circular arches with a cornice and balustrade over. Two of these are blank, being filled up with the front of lodge, and the other arch is made the entrance. The whole composition is, in fact, nothing more than a screen, one-third of which is open. The windows of the lodge are too palatial, and we certainly do not admire the preposterously high pediments over them, nor the way in which the circular moulding finishes. The superimposed upper range of pilasters, the heavy capitals of the lower order, and the weak pier jambs of the archway are all defective points. But the acme of absurdity appears to be reached in the large circular pedimented window over the archway. We are at a loss to know what purpose it can serve, or what it can light? Is it for the clock pendulum, and weights? The author of "Eclipse" has a better notion of the lodge, but the composition is spoilt by the lofty domical entrance and the bad detail, particularly the pilasters resting on the outer sides of the jamb piers. We recommend the author to avoid meaningless ornament, such as he has shown in the upper part of gateway. The design of "Felix" has more the character of a single-story penny-savings' bank than a park entrance. The plan of lodge is certainly not arranged with regard to the comfort of the inmates, there would be a draught through the living-room from the opposite outer doorways. "E." errs as much

one way as "Felix" does in another. Instead of combining the lodge and entrance they are completely detached. Why the passage through living-room into kitchen? "E." has no conception of architectural fitness or propriety, or he would never have perched such weak-looking pilasters upon such heavy battered pedestals as he has done in the piers of his entrance, nor drawn such an archway without a keystone. What is the intention of the sarco-phagi-looking terminals at the corners of balustrade?

Church Roof.

For this subject we have not received many designs, and those submitted are not marked by originality. We place "Trefoil," in circle, first as showing a form of church roof best adapted for modern wants. The design shows a single-framed pair of rafters, cross-braced with collar, the timbers being all 6in. by 4in. Beneath those framed rafters is a simple pointed barrel vault of wood, the boarding being nailed to longitudinal pieces 3in. by 2in. Each bay is divided into three by two main ribs, moulded, 9in. by 4in., between which are intermediate ribs, 6in. by 4in., also moulded. The former rest in stone corbels, and the latter spring from the cornice. At the springing and apex are longitudinal air trunks, perforated in front for ventilation. There is also a similar panel of perforation running along the vault in the centre. The visible ribs are bolted through to the rafters and braces, the plates are framed; from the inside plate on each side are upright studs to the rafters, and the plates are tied together by iron tie rods, supported in centre of span by a king rod. We should have preferred a more obtuse-pointed vault and the apex lower down the roof, which could have been done by shortening the radii. "Saint Lucy" is the next best. It is an open timbered roof boarded up the back of rafters and collar, and showing internally the common rafters and purlins. The principals, 10ft. from centres, are framed into a hammer-beam at the bottom, and tied together by an iron tie. Above they are framed into a collar, and the underside stiffened by curved ribs moulded at the edges and joggled together, these being bolted through the principals. Were it not for the tie rod this form of roof would be very weak at the middle point of ribs, though the author has thrown the pressure of the ribs upon the short hammer-beams, by which it is transmitted by curved wall struts to the corbels below. We notice the purlins are 10in. by 6in., placed vertically. These are shown notched considerably into the principal, a decided objection tending to reduce the strength of the timbers. They would have been better placed the usual way. Arched vertically-placed braces notched into the lower purlin, and abutting against the two principals, are shown in the elevation of bay. These would help to strengthen the roof, but slightly. The principals are not figured, and the detail of connection between purlins and rafters should have been shown. Ventilation is obtained by perforation of the flat ceiling over collar. "Mechlin" is a carefully drawn open-timbered roof of flat pitch, and so much like the typical examples of the Perpendicular period, many of which may be found in Brandon's *Mediæval Roofs*, that there is little to be said for its originality. The principals are framed with collars, moulded braces, or ribs, and hammer-beams filled in above collar with Perpendicular panelling. These are intended to be of oak. We note that the hammer-beam mouldings are too projecting, and would conceal the small panels resting upon it. The mouldings are also not the most effective. "Torpedo" is a design of some ingenuity, though it will not quite explode existing ideas of construction. The author shows a double-framed ribbed roof, with collar, hammer-beams, and braces. The inside curved braces or ribs springing from the hammer-beams are strutted to the wall-posts, and the whole lateral pressure is well brought down the walls. As the construction for a framed truss to be filled in with panelling, the design is not without merit, as the weak points of the principals are well strengthened, the curved ribs not touching the principals at those points, but are strutted to them. The open panels are proposed to be filled with fretwork, but the kind is not shown. No scantlings are

given, and the section of roof is drawn to a smaller scale than required. "Ashlar" shows another roof of low pitch, with cross braces. The truss consists of two principals, 9in. x 6in., joined at top by a collar, but which do not continue to the apex; cross braces, 9in. x 6in., with hammer-beam and curved braces below filled in with uprights or panelling. The ceiling of plaster is continued at the back of the lower portions of the cross braces, with a perforated opening at the crossing for ventilation. We note several objectionable points—namely, the upper struts from collar-beam, the purlins framed into principals—which would seriously diminish their effective strength, the junction of the curved brace upon hammer beam, with a cut end put on separately, and the details generally. The detail of corbel shows a want of knowledge of mouldings. The author does not understand that in drawing sectional woodwork it is not necessary to outline in black the parts joined, as he has done, in the stops at end of hammer-beam. As shown, the meaning conveyed is that the stops are movable instead of fixed, which, of course, is not intended. The designs, as a rule, are wanting in constructive detail.

A Mahogany Bookcase.

For this subject we have placed "B," in a circle, first. The design is divided into three vertical portions—the centre one forming a narrow and slightly projecting part. These divisions are marked by flat pilasters, grooved on face, carrying a cornice, with upper railed shelf for old china. The centre projection is carried up a trifle higher, and has its top railed off as a rest for a vase. With the exception of the centre door in the cupboard, which is rather too cut up with panel mouldings, the design is a sensible treatment. The cupboard doors at the sides are pleasingly framed, but no details are given. "Sperabo" is a more commonplace treatment. The author gets a useful shelf for portfolios, &c., under the centre division of his bookcase, which is divided into three bays. The book shelves simply rest on upright standards—the outer standards being carried up and rounded at the top. The statuette on the top is certainly rather heavy for the cornice. Leather valances fringe the shelves, which are open, and a space is left in the centre upon the cupboard top for nick-nacks. The shelves are fixed with Tonks' patent flush fittings. We do not like the detail of cornice. "Noah" sends a design of the ordinary type in three divisions—the centre one being the deepest and highest. We do not admire the cornice of the centre, which seems ludicrously high for the paltry balustrade over the sides, and there is certainly a discordance between them. The framing of the cupboard doors is sensibly handled, but the details are poor. "Bee," in circle, is a weak attempt at Japanese—the proportions of the cupboard doors and the cove at the top are not satisfactory. Otherwise there is something to be said for the design; for instance, a useful cupboard for MSS. and pamphlets forms the centre bay, and a useful opening is left underneath on the table top. The side shelves are screened by a curtain running on a rod, and a rack for china is shown over the centre at the top. The cove is intended to be painted in oil on a blue ground, and the panels of framing to be decorated with folial ornament on gold ground. "Student" sends a Gothic design, but the details are of an order we cannot commend. The divisional pillars springing out of ramps, the embattled cornice, and the meaningless tracery in the heads of the bookcase doors are not in keeping with the lower framing. The composition would have done well enough in the days of James Wyatt, but it is scarcely up to modern taste.

NOTICE.—In pursuance of our former plan we have determined to postpone the work of the Club till the first week in September, when the next list of subjects will be published. Of course the subjects given in our last list will be received in due course as usual.

RECEIVED.—"Fleur-de-lis"; William Lees (yes); C. E. Kemp (we can find no drawing with that motto, but if it comes to hand it will be returned).

ARCHITECTURAL SCIENCE CLASS.

PLASTERING—PRINCIPLES OF DESIGN.

IN reply to Question 52, "T. N.," "A. L. B.," "Spero," and "Wilhelminus," send good replies; Egbert, "J. S. A. M.," also are correct in the main. It is unnecessary to comment upon this question, as the processes and composition were described in our previous remarks upon plastering. No. 53 has been fairly replied to by "T. N.," who says, speaking of rendering walls, that the wall should be left rough to form a "key" or hold for the plaster, and if applied to an old wall the joints should be raked out, and the wall well wetted before the coat of coarse stucco is applied. "T. N." observes that this first coat varies from $\frac{1}{4}$ to $\frac{3}{8}$ in. thick. "A. L. B." and "R. J." also reply fairly to the question, though the terms "pricking up" and "rendering" are not very clearly distinguished. "Spero" indiscriminately calls the first coat by the first name on both walls and ceilings. Question 54, on the modes of finishing walls, has been rather inadequately answered. "A. L. B." mentions stucco "trowelled" or "bastard," rough stucco, rough casting, scagliola, and distempering, but no mention is made of Parian or Keene's cement, or any of the methods of finish adopted. "Spero's" reply mentions the latter cement, upon a ground of Portland cement, as a good finish. Replying to the advanced questions, "Atneave" says, "where decoration is required to be done immediately Keene's cement should be used." "S. M. E." sends a good form of specification for general plastering. Referring to the walls the specification says, "The walls for painting to be rendered or plastered if on laths, and set with trowelled stucco or with Parian cement; if for paper hangings, to be set with fine stuff, or with coarse Parian cement; the skirtings to be run as per drawings, with Parian cement on a Portland cement backing; where wood skirtings are fixed the space at back to be made good with coarse stuff; the angles of chimney breasts to be formed with a return bead in Parian cement, stopped at top and bottom with moulded stops."

The principles to be observed in designing cement or plaster work have been well stated by "S. M. E." in the published reply, and "Atneave" points to some considerations that should not be forgotten. Thus, he justly says, in designing a cornice it should be borne in mind that it is above the eye. Its members, he goes on to say, should be made to appear as bold as possible, at the same time not too heavy. It would have been better to say that the members should be distinguishable, and of sufficient variety to produce a pleasing play of light and shadow. One of the chief defects of modern plasterer's cornices is, that the members are too coarse; another is that they are not well juxtaposed to produce variety. We often see, for instance, ogees and beads placed together, or combined in such a manner that the effect below is to create a sense of monotony. Another very common defect is over-enrichment or placing large flat patterns on the ceiling or wall, without a sufficient contrast of plain members. All these mistakes arise from not considering that the members of a cornice should be arranged with as much care and discrimination as the colours in a piece of decoration, or as the words in a well-pointed epigram; just as two words of the same or ambiguous meaning produce a pleonasm or tautology, so in like manner, two or more members of one sort produce an unpleasing monotony on the eye. But there should not only be separation and variety with accentuation and contrast, but the shadows should culminate in one deep shadow or hollow between the wall and ceiling, or if in an outer cornice under the corona or chief member. External and internal cornices should be designed on principles determined by the position of the spectator—the light and the height of wall. The height of the room is a very necessary consideration in determining the proportion, whether the cornice should be mainly on the wall or on the ceiling. To produce apparent height in a room the vertically-disposed members should be small and few, and the cornice should be chiefly a flat margin to the ceiling. To reduce height the oppo-

site treatment is necessary. The cornice should be a deep crowning to the wall, and of small projection. There is considerable art in so designing each moulding that it will have the desired effect upon the eye. In lofty rooms a deep frieze is an admirable plan of taking off the height. Another thing to be guarded against is the using a mass of material in any member. The old Queen Anne cornices are very piquant and handsome in large halls and rooms, but they are not a logical mode of treating internal plaster. We prefer infinitely the surface treatment adopted in the Renaissance, as we see in the interiors of the Adams Brothers. In ceiling decoration the principle should be to make the members shallow and surface-like, to avoid deep undercutting, and to indicate as much as possible the nature of the material. Running and simple casting are the only two modes of treatment applicable to plaster, and in no instance should a kind of ornamentation be employed that at all indicates a fibrous material like wood. In the more decorative treatment the same rule should be observed. Heavily-cast enrichments, with undercut flowers and foliage, however admirable as works of the modeller, are absurd when used in plasterwork, and we consider that the most correct mode of decoration is that in which the raised parts are in shallow relief. Hence flutings, medallions, panels of flat-stamped ornament, which can be enhanced, if required, by light tints, are far more consistent in such a brittle and friable material as plaster.

NOTICE.—As we have now gone through the various branches of trades connected with building—a course which has rather exceeded the time we anticipated it would take—we bring this class to a termination at a period of the year when its cessation will be felt as rather opportune by many about to take their vacation. We cannot do so without expressing our thanks to those who have steadfastly remained by us through a rather arduous though pleasing duty. Its pleasure to us has been the knowledge of the fact that our course has been thoroughly appreciated both by those who have taken a part in the class as well as by outside readers. We could fill pages with expressions of approval, while the mutual advantages the class has afforded students are patent to all. The course completed forms, in fact, an encyclopædia of constructional and technical study. It was our intention to follow the science class with a series of questions on the history of architecture; this we defer for the present. For the purpose of the award we shall be obliged if those of our correspondents who have not yet done so will send us their names and addresses.

CHIPS.

Lord Ronald Leveson Gower has accepted the office of President of the Art Department at the ensuing Social Art Congress, to be held at Aberdeen.

Mr. George C. Strawbridge was on Tuesday appointed urban sanitary inspector to the Taunton Town Council.

At the usual monthly meeting of the Council of the Surrey Archaeological Society, last Wednesday afternoon, Mr. Joshua W. Butterworth, F.S.A., in the chair, the annual excursion to different places in Horley, Burstow, &c., was fixed to take place on Monday, the 30th instant, under the presidency of Mr. J. R. Daniel Tyssen, F.S.A.

A public institute and "British workman" public-house was opened at Grangemouth, Glasgow, on Monday. The building has cost £2,600, and is two stories in height, with a spirelet in the centre of the chief front, containing a public clock and bell. The meeting hall seats 400 persons.

A new bridge has been erected at Houghton, West Sussex, by Mr. Bushby, builder. The contracts and extras amounted to £3,025, but it was reported to the county magistrates last week that the contractor was a considerable loser, and that Sir John Hawkshaw had estimated the cost at £5,000.

The memorial stones of a new Wesleyan chapel have been laid at Sandiacer. The building is Gothic in style, and will seat 462 persons, and cost £2,100. Mr. A. H. Goodall is the architect, and Messrs. Henshaw and Son and Mr. W. Bailey are the contractors.

Mr. William Thornes, of Bradford, has been appointed assistant surveyor for the borough of Dewsbury, at a salary of £150 per annum. There were 43 applications.

The chancel of St. James's Church, Moor-park, Fulham-road, was consecrated on Saturday. The chancel has been designed by Mr. E. Christian, and has been erected at an expense of £1,600.

Building Intelligence.

BLACKPOOL.—The foundation stone of the new Church of St. John, Blackpool, has been laid. The plans are by Messrs. Garlick, Park, and Sykes, Talbot-square, Blackpool. They provide for a church to be built of brick, faced with Yorkshire parpontois, and Longridge stone dressings. The edifice will be cruciform, with a nave, north and south aisles, north and south transepts, chancel, vestry, organ-chamber, &c. The height of the nave will be 35ft. to the roof junction, and 60ft. to the apex of the roof, and the projected tower will be at the south-west angle, 14ft. square, and will rise to a height of 139ft. from the ground. The principal entrance will be through the tower. The church will accommodate 1,300 worshippers. The contract, including the tower up to the second string-course, amounts to over £9,000.

BRISTOL.—A new warehouse has just been erected in Christmas-street, Bristol, for Messrs. Clutterbuck and Griffin, from designs by Messrs. Foster and Wood, Park-street, Bristol, the whole of the contracting for the different branches of labour having been carried out by Messrs. Stephens and Bastow, under the superintendence of Mr. Stacey. The height of the building from the pavement line is 50ft., and the space covered is about 80ft. square. It is built of Cattybrook bricks, the window sills and impostes being of Bath stone, the latter having dental mouldings. Each window is surmounted by a hoodmould in brick. There are four floors, the gross area of which give a warehouse room of 25,000ft.

CHELSEA.—The first stone of the new Roman Catholic Church of St. Mary, Chelsea, was laid yesterday week. The building will be in the Early English style, its dimensions being 135ft. long by 82ft. wide, and 66ft. high. It will consist of a nave of five bays, flanked by two aisles of unequal widths (owing to a peculiarity in the ground), and a chancel 45ft. deep. At the end of each aisle there will be a chapel, the one on the south being the old cemetery chapel, which will be incorporated in the new building. The exterior will be somewhat plain. The materials will consist of stock bricks for the walls, Bath stone dressings and Staffordshire tiles for the roof. Mr. J. F. Bentley, of John-street, Adelphi, is the architect.

CROOK.—On Saturday last the foundation stones of two new schools, which are about to be built by the Crook and Billy Row School Board, were laid at Crook and Helmington Row respectively. The school at Crook will afford accommodation for 434 boys; it is estimated to cost £3,575, and will be built from plans prepared by Mr. J. Graham, architect, Sunnyside. The building will be in the form of the letter L, with two class-rooms, reading gallery, and porches back and front. It will be in the mixed Gothic style of architecture to correspond with the adjoining British School. Helmington Row school will accommodate 350 mixed scholars. Mr. Graham, of Sunnyside, is architect for the building. It will be in the Gothic style, and is estimated to cost £3,170.

GREAT BLAKENHAM.—The parish church of Great Blakenham, Suffolk, has been restored at a cost of £600, under the superintendence of Messrs. Cory and Fergusson, architects, of Carlisle. The gallery has been removed, the church reseated, a triplet lancet window opened out above the altar, and the roof restored. Very little has been done externally, and the tower still needs attention. The old brickwork has been restuccoed, and the south porch cleaned and retimbered where necessary. The old Jacobean pulpit, with its rich carving and sounding board, has been retained—not swept away as in too many churches.

HARROGATE.—A new United Methodist College was opened at Harrogate on Tuesday. The original building not being large enough for its intended use, plans for its enlargement were prepared by Mr. Potts, architect, of Oldham; and the different works were contracted for by Mr. Jos. Stephenson, of Harrogate, by whom they had been carried out. On the basement are spacious kitchens; the ground floor consists of entrance hall, dining and reception rooms, master's room, schoolroom, house-

keeper's room and pantry, from which room the kitchens are communicated with by a hoist fitted up upon the most approved principles. The first floor is occupied by classrooms, dormitories, lavatories, and bath-rooms, and the second and third floors also contain dormitories and other useful apartments. All the rooms, and especially the dormitories, are lofty, light, airy, and well ventilated. The whole of the building is warmed by Constantine's hot-air apparatus.

LAINDON HILLS.—The new Church of St. Mary the Virgin and All Saints, Laindon Hills, South Essex, built at the sole expense of the rector, was consecrated by the Bishop of St. Alban's on the 2nd inst. The church is Early Pointed in style, and consists of nave, chancel, north aisle, and organ chamber. The walls are of red brick, faced with Kentish rag stone, and the columns and dressings are of Bath and Box stone. The steeple has for the present been only carried to the level of the roof of the nave, but the designs show a tower and spire 130ft. high. Messrs. Michael Buckley and Co., of Wigmore-street, W., have placed a painted window in the south side of chancel; the subject is the appearance of Our Lord to Mary Magdalen in the garden at the Resurrection. The architect is Mr. W. White, of Wimpole-street, W.; and the builder Mr. Gregory, of Clapham Junction.

LONDON SCHOOL BOARD.—At Wednesday week's meeting of this board, the tender of Mr. W. Downs, of Hampton-street, Walworth, amounting to £8,167, was accepted for the erection of a school for 792 children in Lyham-road, Brixton. That of Mr. S. J. Jerrard, of Loampit Vale, Lewisham, amounting to £307, was accepted, for the erection of an additional girls' class-room at Lewisham-bridge school; as was also that of Mr. Tyerman, of Walworth-road, amounting to £516, for erecting a school-keeper's house at Hunter-street schools, Old Kent-road. For furniture and fittings for new schools the following sums were voted:—Princes-street, Bedford-row (548 school places), £453 9s. 3d.; Canonbury-road, Islington (559 do.), £443 0s. 3d.; Addington-street, Lambeth (576 do.), £447 6s. 9d.; Westcott-street, Southwark (818 do.), £595 11s. 11d.; and Woolmore-street, Poplar (467), £270 15s. 3d., the last mentioned including an enlargement.

METROPOLITAN BOARD OF WORKS.—At Friday's meeting of this board the works committee reported that they had before them an elevation, received from Mr. J. Gibson, of the building, proposed to be erected on plots 9 and 10 in Northumberland-avenue for the Society for Promoting Christian Knowledge, adding, "the elevation has been forwarded to the Royal Institute of British Architects, who, as in the cases of the other elevations forwarded to them, have declined to make any observations thereon until they have before them general designs for the blocks in which the proposed buildings will be erected." The committee recommended that the design be sanctioned, stating that they had instructed the architect to the board (Mr. Vulliamy) to prepare and submit a general design for the block of which these plots form part, which shall be in harmony with the building proposed by Mr. Gibson. Considerable discussion ensued upon the receipt of a report from the fire brigade committee, stating that large additional works had been found necessary at the head-quarter station in Southwark-bridge-road in consequence of the unexpectedly treacherous nature of the foundations the cost of which will amount to about £4,000. It was explained that on removing parts of the existing buildings on the site it was found that they were built on a Roman cemetery, and it had been considered necessary to underpin all external walls; and the committee was authorised to have the necessary works carried out by the contractors. The Parliamentary committee reported that having considered the desirability of the Board purchasing the rights of the lords of the manor over Bostal Heath, they had instructed the solicitor to agree that, on the opposition of the lords of the manor to the bill for confirming the scheme being withdrawn, and subject to the approval of the select committee of the House of Lords, a clause shall be inserted, providing that the board shall purchase all the

rights and interests of the lords in the heath, for the sum of £5,500. It was explained that the board would, if it gave this sum, acquire the right to purchase Plumstead-common for a further sum of £10,500. After some discussion, and a division, the report was adopted.

MILTON.—The Church of the Holy Cross, Milton, Northamptonshire, was re-opened on Thursday week. The chancel has already been restored, and the work just completed includes a thorough cleansing of the arcades, including the pillars, with their bases and capitals, which are now in perfect condition. Additional beauty has been secured to the church by the opening up and complete renovation of the tower arch. The wooden clerestory windows have been removed, and new stone trefoil-foamed windows have been introduced like those at Cranford St. Andrew's and at Barton Seagrave. The old roofs of the nave and both aisles have been renewed in pitch pine. The porch, which was very rude, has been entirely rebuilt in somewhat modified proportions, with small decorated windows on the east and west sides. The whole of the works, including the chancel, have been carried out according to drawings prepared by Messrs. E. F. Law and Sons, of Northampton, and under their superintendance. The works of the chancel have been executed by Mr. Asplin, of the village of Milton, and those of the church by Mr. Gee, of Daventry. The carving was executed by Mr. Phillips, of Northampton. The cost of the entire restoration, including the chancel and architects' commission, &c., will be about £2,800.

REDRUTH.—A new Baptist chapel was opened at Redruth last week. Messrs. Grey and Martin were the builders, and Mr. Hicks the architect. The style is Early English, and the chief feature of the front, 50ft. high, is a large traceried window and a porch at the side. For 5ft. from the basement the walls are of granite rockwork, the rest of local elvan, with Bath stone dressings. The "lay" of the ground allowed of a schoolroom for 300 children being built underneath the chapel. The contract price was £1,500.

STOKENCHURCH, OXON.—On Monday last the foundation stone of new Board schools was laid by Major Fane, of Wounsley House. The new buildings will comprise mixed schools for 160 children and teachers' residence. The site is an excellent one. The materials are to be of flints, with random brick dressings, and with slated roofs. The contractors are Messrs. Taylor and Grist, of Birtton, near Aylesbury, at the sum of £1,849; and the architect is Mr. Arthur Vernon, of High Wycombe.

THE INCORPORATED CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting, the last for the present session, on Monday. Grants of money amounting to £3,224 were made in aid of the following objects—viz., building new churches at Bear-park, in the parish of St. Oswald's, Durham; Harlesden, All Souls, Middlesex; Hugglescote, near Ashby-de-la-Zouch; Kensal Green, St. Jude, Middlesex; Loughborough, Holy Trinity; Mapperly, St. Jude, in the parish of St. Ann's, Nottingham; Newcastle-on-Tyne, St. Matthew; Ponder's-end, in the parish of St. James, Enfield, Middlesex; and Old Ford, St. Paul, in the parish of Bow, Middlesex. Rebuilding the churches at Cricksea, near Maldon, Essex; Newland St. Lawrence, near Maldon, Essex; Southampton, St. Mary; and (on a new site) Upton-on-Severn, near Worcester. Enlarging or otherwise improving the accommodation in the churches at Aston, near Ludlow; Bardney, near Lincoln; Constantine, near Penryn; Exeter, St. James's; Good Easter, near Chelmsford; Goxhill, near Hull; Holyhead, St. Cybi; Mariansleigh, near South Molton, Devon; Market Rasen, Lincoln; Rothley, near Loughborough; St. Ippolyte, near Hitchin, Herts; Stalbridge, near Blandford; Tilston, near Malpas, Chester; Upleadon, near Newent, Gloucester; and Whitestanton, near Chard, Somerset. Under urgent circumstances, the grant formerly made towards re-seating and restoring the church at Felstead, near Chelmsford, was increased. Grants were also made from the Special School Church and

Mission House Fund towards building school or mission churches at Claverham, in the parish of Yatton, Somerset; Nanpan, near Gram-pound-road, Cornwall; and Offerton, near Stockport.

WESLEYAN CHAPEL, TEWKESBURY.—On Wednesday, the 4th inst., the four memorial stones of a new Wesleyan chapel were laid with the usual ceremonies, in the presence of the Mayor (Captain Price, M.P.), and the Corporation of Tewkesbury. The site is one of the best in the town for a public building, and was formerly occupied by the old Market House. The chapel will be about 60ft. long by 32ft. wide, the roof of open timber, the western end being occupied by a gallery, and the east end terminating in an apse. The front elevation—the only part of the exterior visible from the street—will be of Stanway Hill stone walling, with Bath stone dressings. The design is in the style of the 14th century. The old chapel in the town was opened by the Rev. John Wesley, just a century previous to the date of the stone-laying of the new chapel. The architect is Mr. Charles Bell, of 4, Union-court, Old Broad-street, London. The contract has been undertaken by Mr. Thomas Collins, of Tewkesbury (the builder engaged on the restoration of Tewkesbury Abbey Church), and the quantities were prepared by Mr. H. Lovegrove, of 30, Budge-row, London.

PUBLIC HEALTH,

A Weekly Journal of Sanitary Science and Progress. The number published July 20 contains articles on Popular Hygiene, The Birmingham Congress on Domestic Economy, Flat Roofs as Finest of Recreation, Sewer Air, The University of Durham and its Examinations in State Medicine, Guarcol as a Decolorant and Disinfectant, The Physiology of Sugar in the Blood, The Social Science Congress, Hot Air Baths for Treating Diseases, Parliamentary Notes, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c. Price Twopence. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

B. W.—(1. To hold the elements before consecration. 2. "Registering" and "patenting" are two different things altogether. Write to any of the patent agents advertising in the *English Mechanic* for a copy of their instructions to patentees, which they will send post free.)—G. W. WARD. (The house has been executed.)—HUSKIN. (The only means to secure ink from running is to use the best Indian ink freshly mixed, and that not too thick.)—A. R. BROWN. (Apply to Batsford, High Holborn.)

Correspondence.

AN ACT OF BARBARISM.

To the Editor of the BUILDING NEWS.

SIR,—As at this season many architectural students and ecclesiologists are visiting the numerous old churches scattered over all parts of the country, I am induced to trouble you with this communication in order that through the extensive circulation which your most valuable publication enjoys, others may escape a disappointment which fell to my lot last week, when, after travelling a distance of nearly twenty miles in order to procure a rubbing of the fine brass at Brandesburton, near Beverley, Yorkshire, I found after long search the lower extremities only of the knight and lady protruding from beneath some newly-erected, but immovable seats in the chancel. Now as a large space in the nave is occupied by a cumbersome reading-desk and pulpit, and other places in the church seemed to me to be available for additional seats, it is nothing less than an act of barbarism worthy of the last century thus to hide, and very possibly to seriously injure, an invaluable work of art. On an expression of regret being courteously made to the rector, that gentleman treated the matter very lightly, and said that seats for the people were of far more consequence than the exposure of the brass, and he also stated that he had himself ordered and paid for the seats in question. After this, further remonstrance seemed to be useless. The noble brass thus hidden is fortunately engraved in Mr. Boutell's "Monumental Brasces," and also in Poulson's "History of Holderness." It is attributed by Mr. Boutell to Sir John de Saint Quintin and Lora, his wife, and in his descriptive notice he says, "the plate armour of this most interesting brass is elaborately enriched, and the belt is very splendid. The hauberk of mail is shown with unusual distinctness." The date is 1397, 21st of Richard II. The height of the effigy of the knight is 6ft. 8in., and that of the lady 5ft. 11in. The church itself presents Perpendicular features externally, but the interior has 12th and 13th century work in the nave arcades. There is also a very curious and ingenious niche in the north wall of the chancel. The building generally has a most forlorn and desolate appearance, and is seated with deal pews. The "living," which is in the gift of St. John's College, Cambridge, is a valuable one, being worth from £1,400 to £1,500 a year, with house. Trusting that your insertion of this may save some one a fruitless journey, and bring forth some effectual remonstrance, I am, &c.,
ECCLESIOLOGIST.

PEEBLES PARISH CHURCH.

SIR,—Might I be allowed to inquire, with respect to the view of the nice-looking building proposed for the reconstructed form of Peebles Parish Church published in the BUILDING NEWS of the 13th inst., whether the floor-lines of the building shown on the right are inclined upwards from the roadway, or those of the vestry downwards, or whether, for purposes of "art," the draughtsman has adopted the ingenious expedient of using some three or four points of sight at different levels? I remember to have seen an interior perspective view, some ago, by a very distinguished architectural artist, in which, for the purpose of enlarging the scope of view in a large galleried hall, two points of sight were used—one for seeing under the gallery, and the other over it, and the imposing vistas thus obtained led, probably, in part to the success of the design in the competition in which it was submitted, as it secured the author the premium, though not the building. I forget where Brooke Taylor is buried, but it may be well for the churchwardens there to look to the security of his resting place, as this distinguished mathematician and original member of the Royal Society may, it is to be feared, be disturbed in his grave by some of the extraordinary liberties taken with the exact science of linear perspective, first demonstrated as such by him in the admirable treatise which is the one authority on the subject, and the foundation of all treatises of any value which have since appeared on it. If certain draughts-

men are haunted by a ghost in a lace cravat and full crop of long curls, they will have only themselves to blame.—I am, &c., H. P. H.

BIDEFORD GRAMMAR SCHOOL.

SIR,—It may interest those who submitted designs for the new Grammar School at Bideford, in June, 1876, to know that two sets of plans have been retained by the governors until the present month, when they were returned to the respective owners, with thanks and cheques for the respective amounts of five and three guineas, the premiums awarded in the competition, the governors having engaged the services of Mr. R. S. Hookway, builder and contractor, dealer in timber and drain pipes and chimney-pots, to prepare plans and superintend the erection of the schools.

It may be very amusing to a body of country gentlemen to obtain the ideas of architects for a few guineas, but it is rather more than a joke to lend a set of drawings for a year, receiving in return a cheque to about pay for the perspective drawing submitted.—I am, &c., A VICTIM.

Intercommunication.

QUESTIONS.

[5061.]—Removing Putty from Old Sashes.—What is the best process for removing putty from old sashes so as to save the glass? Is there any acid superseding the hot iron process?—AN OLD SUBSCRIBER.

[5062.]—Varnish for Water Colours.—Could any of your obliging correspondents inform me of a thoroughly good varnish for water-colour drawings, either simple or compound?—SUBSCRIBER.

[5063.]—Ambulance.—Will any of your readers inform me what is the meaning of the word "ambulance," applied thus:—"Detached laundry, 'ambulance,' stable, &c., to be provided?"—HOSPITAL.

[5064.]—Iron Girders.—Will painting iron girders, after they have begun to rust, stop the corrosion? If not, how long before they are liable to become dangerous from the rust eating into the iron?—W. L.

[5065.]—Main Sewers.—The local authorities in a sea-side watering-place are contemplating the construction of a brick culvert to supersede the present drain—a stoneware pipe of small dimensions—and for the purpose of being satisfied on all points I beg the liberty of asking one of your experienced engineering correspondents:—1. How to calculate the number of houses or w.c.'s, a 3ft. 6in. x 2ft. 6in. sewer will carry, with the ordinary means of flushing by street gullies, &c.? 2. Is not a fall of 1 in 100 considered a good one? 3. Does a simple, open, ventilating shaft—without a charcoal filter—work efficiently, or do the noxious gases become a nuisance to passers-by, the grating being on road surface? 4. Can a 9in. invert and arch, with 4½in. sides, be constructed with safety, so as to afford sufficient resistance to the subsoil, or should the section be 9in. all round?—OUT-FALL.

[5066.]—Architectural Models.—Will one of your readers be good enough to state the best method for colouring cardboard models, so as to represent the various materials used in the building, and whether such colouring should be done before the various parts are gmmmed together? Also, what is the best material for small models—say, to a ½in. scale?—MORGANWG.

[5067.]—Measuring Plasterers' Work.—Is it not usual in measuring plasterers' work, either for labour only, or for labour and materials, to measure the actual work done, allowing a small margin for skirtings, architraves, and mantel-piece finishings, unless a stipulation in the contract or specification provides that all openings are to be measured in?—MORGANWG.

[5068.]—Where to Place the Felt in a Roof.—The Wesleyan chapel, Steyning, is building from plans by Lund and Son, architects, Worthing; the span of roof is 29ft., and the rise is 20ft.; it is boarded up to the collar-beam with square-edge ¾ boards (these felled). What is the proper lap for countess slate? Also, above the collar-beam, it is not boarded, nor have I felted it, but will felt the square-edge boarded ceiling. (Which is the proper place to put the felt—under the slates, or on the ceiling-boards?) The ceiling has six cast-iron ventilating grates in it, 2ft. 6in. by 9in. I shall be exceedingly glad if some one of your well-versed readers in building will answer these few questions for—C. B. O.

[5069.]—Cast-Iron Girder.—"Cast Iron" does not furnish sufficient particulars. He asks if 3cwt. is too much to allow as a permanent safe load on a girder 16ft. bearing, and 9ft. from centre to centre. Does he mean this load to be in the middle, or distributed? This is important. Also, does he mean that this weight is the weight to be borne by the whole floor, or that only which would be borne by the girder in question? Before an answer can be given it is necessary to give these data. The load mentioned is certainly not too much for any ordinary-sized girder of this span, which would well bear nearly two tons in the centre. What I mean by

ordinary size is one, say, 9in. deep, with a bottom flange of about 8in. Such a girder would bear that weight in the centre.—G. H.

[5070.]—Country House.—1. In building a house to cost about £2,000, what difference in the contract would it probably make if the water, instead of being on the site, had to be fetched 100 yards? 2. Can you mention any work (not purely professional) treating of the construction, &c., of a gentleman's country house? 3. About what amount would the construction of a well cost in a soil of sand and sandstone where water is anticipated at 55ft. By construction, I mean labour, digging, bricks, and laying of bricks—all except pump machinery, in short. If you would reply to these you would greatly oblige. I inclose my card.—BEAVER.

[5071.]—Proportion of Rooms.—Will any of your readers inform me what principles should be observed in proportioning rooms as regards length, breadth, and height?—STUDENT.

[5072.]—Dimensions for a Fives' Court.—Will any of your numerous correspondents give me, through the "Intercommunication" column, information as regards a small fives' court—principally the length and width of court itself, the height of back wall, the length of flank or wing walls, and the height of the latter at their lower point.—BUNCH OF FIVES.

REPLIES.

[5046.]—Cornice to Verandah.—If the verandah is formed of wood a gutter can readily be affixed to plate. Acting as a cornice, and lined with lead, the lead to turn up under slating, or one of the lighter patterns manufactured by MacFarlane and Co., of Glasgow, and shown in their catalogue for rain-water goods, would answer the same purpose, no matter what material the verandah may be constructed with.—M. HAWNEY.

[5059.]—Cast-Iron Girder.—A girder of cast iron 16ft. bearing to carry a floor of 146 square feet, reckoned at 3cwt. per square foot (load and weight of floor), should be of the following dimensions:—16in. deep; 20 square inches, sectional area of bottom flange in middle; 3½ square inches, sectional area of top flange. Your querist himself may judge best of what allowance should be made for the load, and I would recommend him to consult his client on this point, being careful not to underrate it. By diminishing the width of the bottom flange at the ends a little metal may be saved, but it is preferable, I think, for the top and bottom flanges to be parallel to each other. The surroundings, however, more often than not, determine these points.—M.

PARLIAMENTARY NOTES.

THE SCIENCE AND ART DEPARTMENT.—Mr. Chamberlain, on Monday, moved a resolution declaring that the expenditure for the promotion of science and art should not be exclusively confined to institutions in London, Edinburgh, and Dublin; but he did not press it on being assured by Lord Sandon that the subject was under consideration, and that the Government would be prepared to deal with it next session.

WATER SUPPLY AND SANITARY MATTERS.

NEWBURGH.—The first sod of the new water-works at Newburgh was cut on Friday last. Messrs. Joseph Shaw and Sons, are the contractors. The distributing reservoir of the new works measures 97ft. by 27ft. by 20ft., inside measurement, built of whinstone rubble, and coated with Portland cement. The height of the reservoir above the town will give about 250ft. of water pressure, sufficient to reach the highest buildings in case of fire. The estimated cost is about £2,100.

CHIPS.

Mr. Westcott has been re-elected surveyor and inspector to the borough of Basingstoke. His salary has been increased from £120 to £130 per annum, and a gratuity of £10 awarded to him for extra work.

Mr. Charles Barry was in Edinburgh last week, engaged, at the instance of the managers of the Royal Infirmary, in making a thorough examination of the new infirmary buildings. His investigations lasted two or three days, and his report is expected next week.

The *Gardeners' Magazine* contains "a complete audit of City trees," accompanied with notes and an essay on City trees and shrubs generally. Mr. Hibbard tells us there are 1,200 fine trees within the boundaries of the City, and, in addition, over 2,000 undershrubs. The detailed enumeration shows the numerical proportion of the several kinds of trees, the plane and the lime occurring most frequently.

The Blairgowrie Police Commissioners have appointed Mr. Young, C.E., Perth, as engineer for the drainage of the burgh, the burgh surveyor having lately been dismissed, and Mr. Mackinson, Dundee burgh surveyor, having declined to superintend the works. Mr. Young is to use the late surveyor's plans as far as they go, and make a deduction from his fees accordingly.

LEGAL INTELLIGENCE.

A LIGHT AND AIR CASE.—THE NATIONAL AND PROVINCIAL PLATE-GLASS INSURANCE COMPANY v. THE PRUDENTIAL INSURANCE COMPANY.—This case, decided on Monday, by Mr. Justice Fry, in the Chancery Division, was a light and air action which has occupied several days, and raised, if not some novel points, some new forms of a question which was much discussed in more than one case some 12 years ago, and was set at rest, as was supposed, in the House of Lords in the case of *Taplin v. Jones*—namely, the effect of alterations in ancient lights in extinguishing the rights of the owner of a dominant over a servient tenement. The plaintiffs in the action are the owners of a house in their own occupation on Ludgate-hill, which was considerably altered in the year 1874; previously to that time they had let off the first and part of the ground floor, and occupied only the back part, which consisted of a back room, ill-lighted by a sort of skylight or dormer window, and an entrance and staircase leading out of Belle Sauvage-yard. The light was there admitted to the back-room through a skew opening in the flat ceiling by means of three panes of glass, forming a nondescript window, set at different angles under a projecting part of their own building. By their alterations they converted this opening into an ordinary skylight, and put back part of their building which overlapped it, so that they got light from the sky directly over head, and made alterations in the internal arrangement of the ground-floor by putting up glass divisions instead of party walls and otherwise, so as to improve the light of the room. In clearing the space overhead of the skylight they had set back some upper windows. The defendants are the next-door neighbours of the plaintiffs, and have recently commenced alterations in their buildings, which, it was alleged, would seriously interfere with the light coming to the plaintiffs' house both through the upper windows and through the skylight; and the questions were raised whether by setting back the upper windows and by turning round the plan of the skylight and otherwise altering it, the plaintiffs had to any extent abandoned their rights. The injuries complained of were in respect of several alterations; but the evidence satisfied his Lordship that the only material damage was caused by the erection of a parapet or wall about 4ft. high close to the plaintiffs' skylight. Mr. Justice Fry, after having stated the facts, said that the evidence satisfied him that the only material damage was on account of the parapet, which he was of opinion materially affected the plaintiffs' premises in their present state, and would also have damaged them in their old state. He explained the law under the Prescriptive Act, by which the custom of the City of London was altered, and the right to light and air, after 20 years' uninterrupted enjoyment, was given, and the decision upon that Act of *Taplin v. Jones*, in which the House of Lords decided that the mere enlargement of a window did not operate as an abandonment. The principle of that case he held applicable to windows which had been put back; a contrary conclusion to this seemed to him against common sense. Referring to the Act, he considered that an owner's right was not limited by the aperture in his own wall. A right to any aperture in his own wall he had independently of the Act; but he interpreted the decision in *Taplin v. Jones* as laying down that the owner of the dominant tenement had, notwithstanding alterations, a right to the enjoyment of the space of light and air coming over the several tenements so far and in such a way as he had before such alteration. That being so, the only question to decide was whether he should grant an injunction or award damages—a question depending partly on the conduct of the parties in respect to the action and partly on the circumstance of the buildings. He held that the plaintiffs had not used such diligence as that they were entitled to an injunction, and assessed damages at £200; but as they had put their case far too high and claimed much more than they were entitled to, he gave no costs.

WAGES.—Mr. Bridge heard several summonses at the Wandsworth Police court against Mr. Levi John Rudeforth, a builder, of Bangor Wharf, Langdale-road, Peckham, for wages claimed by workmen employed on his houses on the Sisters' House estate, Lavender Hill, Battersea. The defendant said he did not employ the men, but made a contract with Herbert Freeman for the carpenters' work, and he engaged them. Freeman had overdrawn the account by £200. This was denied by Freeman, who had a claim against the defendant, and he said there was no agreement.—Mr. Bridge said he should like to have decided for the men, as it was very hard upon them to sub-contract the work, and then disavow their claim.—The summonses were dismissed, but others were granted forthwith against Herbert Freeman, who employed the men.—Mr. Bridge, in ordering the amounts to be paid, told the defendant not to take out contracts, and not pay men in public-houses.

LIGHT, OBSTRUCTION TO.—ROTHWELL v. THE COMMISSIONERS OF PUBLIC BATHS AND WASH-HOUSES, ST. PANCRAS.—This was a motion, recently, in the Chancery Division, to restrain the defendants from building on the site of the old Fitzroy-market, a building higher than 24ft., or nearer to the plaintiffs' premises than a distance of 24ft. Mr. Glasse, Q.C., and Mr. Brookshank appeared for the plaintiff; Mr. Higgins,

Q.C., and Mr. Macnaghten for the defendants, were not called upon. The Vice-Chancellor said the old Fitzroy-market was 24ft. high and 24ft. distance from the plaintiff's house. The market had been pulled down, and was now in the hands of the defendants, who intended to turn it to a most useful purpose. The building which they had erected was 26ft. high, and 1ft. nearer the plaintiff's house than the old market. The injury was so immaterial that it was not a case for an injunction, though at the hearing Mr. Rothwell might get damages. The injunction was refused.

OFFENSIVE ASPHITS ON A BUILDING SOCIETY'S ESTATE.—Thirteen persons occupying houses in the Brickyard Killamars, belonging to the Sheffield Permanent Benefit Building Society, were recently summoned to Ekington Sessions, charged with allowing the privies and asphits of which they are the occupiers to be in such a state as to be a nuisance and injurious to health. Mr. Birch proved that on the 7th inst. he visited the premises and found the asphits in a very filthy condition. He posted a notice on the premises, but the defendants failed to comply with it.—Dr. Macintosh, medical officer of health, deposed that he found the refuse standing in the yard, and it was necessary for health that it be removed.—The summonses in two cases were withdrawn, and an offer was made to do the same in the other cases if a promise was given that the nuisance be remedied, and the costs, 4s. 6d., in each case were paid. This was agreed to by all but two defendants, on whom the Bench thereupon imposed a penalty of 10s. each, in addition to the costs.

SUPREME COURT OF ADJUDICATION, COURT OF APPEAL.—*Bourke v. Alexandra Hotel Company.*—In this case, which was an appeal from Vice-Chancellor Malins, the plaintiff who was owner of 15, St. George's-place, Knightsbridge, sought to restrain the defendants, whose hotel is No. 16, and other houses in the same terrace, from blocking up five windows in the party walls, and from raising a party fence wall separating the areas of the two tenements so as to darken the windows which opened into an area or wall separating the plaintiff's and defendant's tenements. The Vice-Chancellor held that the defendant company were wrong throughout; they were wrong in giving notice to block up the five windows, and they were wrong in giving notice to raise the wall so as to obstruct the eight windows; that the litigation had been most vexatious, and he granted the injunction with costs.—On the appeal, which was as to the five windows only, Mr. Higgins, Q.C., and Mr. E. Cutler were counsel for the plaintiff; Mr. Glasse, Q.C., and Mr. Romer for the defendants.—Their Lordships dismissed the appeal.

LUDEROOK V. BARRETT.—This case, reported in the *Solicitors' Journal and Weekly Reporter* for 9th June, Vol. XXV., p. 649, is not without interest to architects, independently of its novelty, for it is the first time the point has come before the courts. A decorator undertook to decorate work to the satisfaction of the defendant, an architect. The architect, as it is alleged, in collusion with the person for whom the work was done, refused to certify, and the decorator could not get paid. Whereupon he brought an action against the architect for a collusive and fraudulent refusal to signify his satisfaction, and the Court of Common Pleas held that the action could be maintained. Mr. Justice Grove remarked that the fact that no such action had been brought before had raised a doubt in his mind, but he could see no reason why the architect should not be liable.

DAMAGE TO WORK BY WEATHER.—*Harris v. Higgins.*—Gravesend County Court.—This action was brought to recover £1 15s. 2d. The defendant, a bricklayer, repaired a roof for the plaintiff, after which wet weather set in and washed a portion of the work away. The plaintiff employed another workman to repair the damage, notwithstanding the defendant offered to make good the same. The judge said as the work had been properly done in the first instance, the defendant could not prevent the rain from destroying his work. He should order the defendant to pay 10s.

PARTNER. — MISCONDUCT. — CLAIM FOR DAMAGES.—*Hill v. Keddell.*—Chancery Division.—The action was by the executors of a deceased partner against the two surviving partners of the well-known London building firm of Hill, Keddell, and Waldram, for accounts of the partnership which had determined by the death. One of the two defendants made a counter-claim for damages, alleging misconduct against his co-partners, on the ground that they had endeavoured to starve him out of the business by refusing to carry it on. The Master of the Rolls held that a partner could not claim damages against his co-partner for misconduct.

DISCOUNT FOR CASH PAYMENT.—Westminster County Court.—*Litchwitz v. H. J. Taylor.*—This was a cause remitted from the High Court of Justice to this court for trial, and was one of some peculiarity. Mr. Oppenheim appeared for the plaintiff, and Mr. Lord for the defendant. The plaintiff is a zinc merchant, carrying on business at Westbourne-park, and the defendant a builder, of Elm Park, Haresden-green. It appeared that at the latter place the defendant is carrying on building operations of an extensive character, and that a Mr. Greaves watched the progress of the erections on the

part of the freeholder, and early in September he introduced the plaintiff to the defendant for the purpose of providing the zinc roofing to several houses. The work was measured up and an account sent in, and the defendant forwarded a cheque before a month's credit had expired, deducting 5 per cent. for prompt payment. A letter was sent by the plaintiff in answer, stating that he could not afford to allow more than 2½ per cent., and that he would charge the remaining amount to the next account. The plaintiff, during November and October did other work amounting with that due on the previous account to £28 10s., and the defendant wrote to him stating that instead of paying cash he would accept a bill at three months. The plaintiff forwarded a bill for acceptance for £29 6s., charging 15s. interest, and the real question between the parties was, whether the transaction was a cash one, or subject to the usual rule of trade—viz., three months' credit on a bill being given. The amount of debt had been, by order of the High Court, deposited in court to await the decision of his Honour, who, after hearing the evidence on both sides, came to the conclusion that the defendant had a right to credit for three months without interest, and therefore gave a verdict for defendant with costs.

THE ARTISANS' AND LABOURERS' DWELLINGS COMPANY.—Another Director Involved.—The late secretary of the Artisans' Dwellings Company, Mr. W. Swindlehurst, and Mr. E. Saffery, estate agent, were again brought up (the former in custody, the latter surrendering to his bail) at Bow-street on Wednesday, charged with conspiring to defraud the shareholders of the company. With them was now associated Dr. Baxter Langley, the chairman of the company until a few days ago, to whom it was alleged that a portion of the money corruptly paid to Swindlehurst could be traced. The evidence mainly consisted in tracing the notes that had been paid on the purchase of estates by the company, and the defendants were again remanded.

CASES UNDER METROPOLITAN BUILDING ACT.—*Bad Building.*—A Caution to Builders.—On the 26th ult. Mr. J. Stanway, the builder of Nos. 37 to 49, Shaftesbury-road, Hammersmith, appeared before Mr. Paget, at the Hammersmith Police-court, in answer to a summons taken out by Knightley, district surveyor of Hammersmith, requiring him to take down the south flank wall of No. 37, in consequence of having built it with broken bricks, not properly bonded and solidly put together, as required by the Building Act. Mr. Knightley produced a sample of the broken bricks used in building the wall, and explained how impossible it was to form bonded work with such material, and side by side showed the method of bonding with bricks of the size specified by the Act. He had continually complained of defendant's buildings, but finding remonstrance useless, now asked the magistrate to order the demolition of the wall. He called a witness, Mr. E. F. Roberts, a local architect and surveyor, who alike spoke to the bad quality of the work, and his assistant, who saw the sample taken from the building, and the magistrate having expressed his intention of making an order, unless defendant could bring evidence to alter it, he (defendant) applied for an adjournment, and paid costs, 30s. At the adjourned hearing, on the 17th inst., Mr. N. Bazalgette, instructed by the Metropolitan Board of Works, appeared for Mr. Knightley, and Mr. Claydon for defendant, and the cross-examination of defendant's witness proved nothing beyond confirming the belief in the mind of the magistrate that the walls were badly built. He summed up as follows:—"The question before me is one of bare fact: are these walls built in the manner specified by the Building Act—that is to say, do the bricks overlap each other and form bonded work, and are the bricks, as specified by the Act, not less than 3½ in. long? It has been shown that there was a large quantity of broken bricks or 'bats' used. The district surveyor complained of this, gave notice to amend, and followed it up by a letter that such notice could not be waived; but defendant deliberately built the walls higher with the same bad material, in direct opposition to the proper authority." He, therefore, made an order as prayed, with general costs, amounting to £1 15s. 6d.

The Padsey School Board has accepted tenders from Messrs. Illingworth, Ingram, and Co., amount to £475, for the entire furnishing of the two schools just erected by the board.

The Church of St. Peter, Sandwich, built in the reign of King John, and which has been partially restored, is about to be completed. Mr. W. White, F.S.A., of 30, Wimpole-street, is the architect.

NOTICE OF REMOVAL.

CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS,
Have REMOVED from 57, St. Paul's Churchyard, to new and extensive Premises,
123, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.
Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

Trade News.

WAGES MOVEMENT.

DARLINGTON.—After extending over some weeks, the strike has been adjusted by the withdrawal of the claims made by the employers. The Master Builders' Association, finding that two firms in the town who have large contracts on hand, were subletting the work to the men on strike, held a meeting, and decided that rather than allow such practices to be continued, they would resume the *status quo ante bellum*, and consequently signified to their men that they would be at liberty to resume work on the old terms of payment—namely, 36s. for bricklayers, 37s. 1½d. for masons, and 39s. for plasterers, per week of 49½ hours. The dispute originated in a proposal made by the employers that the men should work by the hour, under an arrangement that would have made a difference of about 11d. per week in their wages. Minor matters were put forward for revision and change, but the men would not allow any deviation from the former wages of the trade. The building trade has not been very brisk in Darlington lately. Scarcely anything has been doing in the way of large jobs, except the new hotel at Bank Top, and the new Darlington Grammar School, both of which are now approaching completion. Hence some employers have not made a fresh start yet, and it is said to be probable that during the rest of the year the men engaged in the building trade will have to suffer a lot of broken time.

EDINBURGH.—At a meeting of the operative painters of Edinburgh on Saturday evening, a resolution was all but unanimously adopted, declaring the shops open at 7½d. per hour as the minimum rate of wage, and agreeing to send notice of this to the masters who had conceded the demand for 8d. per hour, so as to enable them to compete with the Associated Employers. It was stated at the meeting that the strike had lasted fourteen weeks, that the operatives had no prospects of success, as members of the society were daily returning to work at the masters' terms, and that the General Alliance was, therefore, not inclined to countenance the struggle any longer in the mean time. The strike, it seems, cost the Alliance upwards of £350.

MANCHESTER.—At a meeting of the master builders last week it was reported that new men are gradually coming into the town. A letter from the Hulme Lodge of the General Union of Carpenters and Joiners having been read, it was unanimously resolved—That this meeting thinks it undesirable to meet any further deputations from the operatives, inasmuch as it might lead to a belief that the employers were countenancing an attempt to compromise the dispute. The shops are open at 8½d. per hour, and the employers see nothing to induce them to depart from the position they have taken up. The number of men on the relief books of the Carpenters and Joiners' Union at the close of last week, is stated to have been 980. The total income of the United Trades Committee up to that time was £1,662, including over £1,000, the amount of seven weeks' local levies. The secretary of the strike committee announces that the authorities of the Amalgamated Carpenters and Joiners in Birmingham have decided to impose a compulsory levy of 1s. per week per member in aid of the Manchester strike. This levy will bring in £14 per week; and in accordance with a further resolution, a contribution of at least that amount will be continued until the termination of the dispute. Other contributions are also announced.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's Pills.—A gap existed in the treatments of diseases prior to the discovery of these priceless Pills, which successfully rectify a disordered digestion before the whole frame is affected by disease. Want of appetite, furred tongue, acidity, flatulency, distension, and other stomachic annoyances are readily removed by Holloway's medicines.

TENDERS.

BOSTON.—For the erection of a new infirmary for the poor law guardians of Boston. Mr. Wheeler, architect:—
 Lucas, J. £36 0 0
 Clarke, H. 822 0 0
 Lovell and Darby 761 12 0
 Bowles 756 0 0
 Pannell, James 750 0 0
 Harrison and Leng (accepted) 734 11 0
 (Architect's estimate, £780.)

BRAY.—For a villa residence, stables, and lodge, at Grove Hill, near Bray, Co. Wicklow, for James Jameson, Esq. Messrs. Millar and Symes, Dublin, architects; quantities (for the villa only) by Mr. Haus Harford, Dublin:—
 Millard, Dublin £20,450
 Moyers, Dublin 19,700
 Kinninmont and Son, London 19,523
 Bolton, Dublin 18,850

BRISTOL.—For erecting new class-rooms, enlarging school-room, and restoring outside of chapel for the Brunswick Congregational Sunday Schools Building Committee. Mr. J. W. Frew and Sons, architects, 1, Wine-street, Bristol:—
 Stevens and Gardiner (accepted) £1,583

BRENTFORD.—For the erection of two semi-detached residences. Messrs. Smithies and Gladman, architects:—
 Barnes, Acton £1,953
 Gibson 1,592
 Taylor 1,588
 Falkner 1,547
 Nye 1,511
 Beauchamp 1,419

BRIGHTON.—For laying out two new streets, Kemp-ton, with drainage, metalling, kerbing, &c. Mr. Fred. W. Hyde, surveyor:—
 Bruton £1,680
 Barnes 1,515
 Howard (accepted) 1,491

BRIGHTON.—For alterations and additions to the Gladstone Hotel, North-street, with bowling alley, assembly-room, billiard-room, and entrances in rear of hotel, for J. S. Ashton, Esq. Mr. Fredk. W. Hyde, Brighton, architect:—
 Patching and Webber £3,046
 Lockyer 2,994
 Cheesman and Co. 2,940
 Nash and Co. 2,888
 Colwell 2,780
 Bruton 2,650
 Stenning and Co. 2,639
 Ancombe, J. 2,577
 Howard 2,575
 Barnes 2,560

BUCKS.—For new workmen's club, Tyler's Green, for Sir Philip Rose, Bart. Mr. Arthur Vernon, architect:—
 Woodbridge £850
 Silver 747
 Loosley 670
 Wheeler 573

BUCKS.—For additions to Baptist schools, Wycombe Marsh. Mr. Arthur Vernon, architect:—
 Silver £116 0 0
 Nash 368 0 0
 Hunt 359 10 0
 Taylor 353 0 0

CHESHIRE.—For construction of new sewers in 15 streets. Mr. G. H. Stayton, C.E., surveyor to the vestry:—
 Contract No. 1:

Brass £4,658
 Mears 3,822
 Pearson 3,284
 Thompson and Son 3,250
 Killingback 3,250
 Nowell and Robson 3,150
 Ford and Norris 3,073
 Braid and Co. 3,000
 Neave and Son (accepted) 2,614

Contract No. 2:
 Brass £4,200
 Mears 3,461
 Pearson 3,086
 Thompson and Son 3,000
 Prout 2,955
 Killingback 2,900
 Ford and Norris 2,805
 Braid and Co. 2,800
 Nowell and Robson 2,799
 Neave and Son (accepted) 2,420

Contract No. 3:
 Brass £3,790
 Mears 3,231
 Killingback 2,950
 Prout 2,900
 Thompson and Son 2,900
 Pearson 2,843
 Nowell and Robson 2,700
 Ford and Norris 2,629
 Braid and Co. 2,600
 Neave and Son (accepted) 2,247

ERITH.—For the erection of a board-room and offices for the Erith Local Board of Health. Edward Hyde, architect, 12, Queen Victoria-street, E.C.; quantities supplied by E. J. Paine, quantity surveyor, 11, Great James-street, W.C.:—
 Jarvis, Erith £1,193
 Green, Belvedere 1,110
 Blake, Grave-end 1,095
 Catchpole, Erith 945
 Miles, Crayford 910
 Hills, Erith 927
 Tongue, Plumstead (accepted) 924

FANHAM, NEAR BRISTOL.—For erecting the Chiddy Memorial Cottage for the committee of the Chiddy Memorial Fund. Mr. J. W. Trew and Sons, architects, 1, Wine-street, Bristol:—
 King, Charles, Bitton £273
 Stevens and Gardiner, Bristol (accepted) 267

ILFRACOMBE.—For forming roads and constructing drains, at the Stolars, for Capt. Walters. Mr. W. M. Robbins, architect, Ilfracombe:—
 Shepherd £283 16 0
 Mason 265 0 0
 Tucker 219 10 0
 Slece 192 10 0

MAIDENHEAD.—For the erection of new laundry at the Cookham Union Workhouse for the Board of Guardians. Mr. C. Cooper, architect; quantities by the architect:—
 Cox, C. W. £469
 Woodbridge 460
 Partlo Bros. 394

MARGATE.—For the erection of a villa residence on the Mill Green Estate for Wm. List, Esq. Messrs. Smithies and Gladman, architects:—
 Bushell and Sons £2,038

WENNESBURY.—For alterations and additions to offices for Messrs. Thursfield and Messiter, solicitors. Messrs. Horton and Scott, architects; quantities supplied:—
 Butler, G. P. £690
 Mullin, J. 640
 Prow and Sons (accepted) 560
 Whitehouse, J. 554

WYCHOLD, BROMSGROVE.—For farm buildings, at Holp-ridge Farm, for John Blick, Esq. Mr. John Cotton, architect:—
 Brazier and Weaver £397
 Harris and Cook 371
 Bourne 370
 Stokes (accepted) 349

LONDON.—For new warehouse buildings, St. Mary Axe. Mr. H. H. Collins, 61, Old Broad-street, E.C., architect; quantities supplied by Messrs. Batstone Bros.:—
 Bracher and Son £9,420
 Scrivener and White 9,185
 Newman and Mann 9,030
 Waldram and Co. 9,020
 Brown and Robinson 8,960
 Morter, J. 8,848
 Brass 8,815
 Byles Bros. and Allen 8,759
 Merritt and Ashby 8,737
 Mark, F. 8,700
 Nightingale, B. 8,562
 Abraham, R. 8,468
 Kirk and Randall 7,840

NEWARK.—For erecting the Mission-house, Balderton-gate, Newark. Mr. Geo. Sheppard, borough surveyor, architect:—

Baines £910 0 0
 Hancock 866 0 0
 Hunter 848 10 0
 Doncaster, W., Fiskerton 838 5 6
 Hoe, Edwin 835 0 0
 Lane, Cuthbert 815 16 0
 Duke, W. 809 0 0
 Henderson, Thomas (accepted) 795 0 0

Also alterations to girls' schools:—
 Lane 186 0 0
 Hoe 178 0 0
 Henderson 167 0 0
 Duke, W. (accepted) 141 0 0

SOUTHWICK.—For master's residence, for the Southwick School Board. Mr. Frederick W. Hyde, North-street, Brighton, architect:—
 Triggs and Willett (accepted) £324 10 0

SURREY.—For semi-detached villa residences, Caterham Valley, for A. Weller, Esq. Mr. J. Glenn, architect:—
 Byles Bros. and Allen £2,790
 Longley and South 2,702
 Staines and Son 2,668
 Cullum 2,554
 Ennor, Julian, and Co. 2,500
 Ridge, Croydon (accepted) 2,412

WOLVERHAMPTON.—For the erection of four houses at Riches for J. H. Ashton, Esq. Messrs. F. and A. Wheeldon, architects:—
 Lovatt £2,100 0 0
 Higham, G. and F. 2,007 0 0
 Barratt and Skinner 1,991 14 0
 Gough 1,870 0 0
 Wiley and Pitkin (accepted) 1,840 0 0

WOLVERHAMPTON.—For alterations and additions to the Darlington Arms Inn, for Mr. Thomas Davis. Messrs. Horton and Scott, architects; quantities supplied:—
 Mallin £667 0 0
 Horsman 540 0 0
 Lovatt 530 0 0
 Groves 479 0 0
 Gough (accepted) 463 4 0

YORK.—For the erection of 12 new villa, Fulford Grange Estate. Mr. William Lewis, architect; quantities supplied:—
 Weatherley (bricklayer & carpenter) £3,752 7 0
 Hobden (stone mason) 617 6 0
 Rawlings (plasterer and slater) 1,066 8 0
 Lyons (plumber and painter) 670 0 0
 Hill (smith and ironmonger) 256 6 0

(Accepted) 6,365 0 7

BATH STONE OF BEST QUALITY.

WESTWOOD GROUND BOX, GROUND, CORSHAM DOWN, and COMBE DOWN.

RANDELL, SAUNDERS, & CO., LIMITED

Quarrymen and Stone Merchants.

Prices, delivered at any part of the United Kingdom, furnished on application to

BATH STONE OFFICE CORSHAM, WILTS. [ADVT.]

Geometrical and Encaustic Tile Pavements in every variety. Over sixty New Designs at 5s. 6d. per yard super. "The Tiles are excellent, both in quality and colour."—*BUILDING NEWS*. "They are of great excellence in design—the material is not surpassed by any found in this kingdom."—*Art Journal*. "For paving conservatories they are the best tiles we have seen; there can be no end to their wear."—*Gardener's Magazine*, &c. &c. Designs and sample Tiles free on application to WEBB'S WORCESTER TILERIES COMPANY (Limited), Worcester.

Lampough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL-POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world and the maker, 113, Holborn Hill. Use no substitute.—[ADVT.]

BULL'S PATENT BRICK KILNS

Effect a saving of over 50 per cent. in fuel, and are the cheapest to build, each kiln costing only from £75 to £150, exclusive of roof. For particulars, and to see working, apply to HERMANN WEDEKIND, 155, Fenchurch-street, London, E.C., or HUMPHREY CHAMBERLAIN, Patent Brick Works, Barnsley.

CITY FREEHOLD.—To be LET on

Building Lease, situate close to the Post-office, and ripe for immediate development as a site for a warehouse or business premises.—Messrs. DEBENHAM, TEWSON, and FARMER, 80 Cheapside.

FREEHOLD BUILDING LAND in

GRAFTON STREET, NEWPORT MARKET, suitable for the erection of light warehouses, to be LET for 99 years; about 8,500 superficial feet.—Apply to Mr. F. BEESTON, Architect, 16, Walbrook, E.C.

BEDFORD-HILL ESTATE,

BALHAM.—Eligible BUILDING LAND to be LET, on long Lease, (Good roads and sewers.—Apply to Mr. STOCKER, 12, St. Mary Axe, E.C.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 27, 1877.

A PLEA FOR ECLECTICISM.

A SURVEY of recent architectural works cannot fail to force the conviction upon us that, despite the overruling influence of fashion, and the abject return to antiquated ideas, there is a growing tendency to types that are more favourable to modern usage. Wherever a revived style has taken root we may be sure of finding indications of features that are not far removed from our actual wants—a “survival of the fittest” has been going on in that constant struggle between the architect’s ideas and the demands of the builder. It may nevertheless be true that the sentiment in which these features are expressed may be quite in discord with the age; it may be thoroughly retrogressive in some instances, as we find it in the ultra-Gothic, in the Jacobean and Queen Anne buildings, which emanate from a school of artists ever prone to admire the past more than the present. Even here, however, we may discern traces of the operation of the law of what we may call progressive modification. In spite of the artist’s individuality, in the face of all the care and effort to give his building the air of quaintness and *négligé*, we cannot be mistaken as to the authorship. If we examine the executed works of masters of this school of art—thought—a school we may call fairly the re-representative—we find they seldom fulfil our expectations of success, even in the sense of being fair realisations of the drawings on paper. Exquisitely quaint and picturesque as are the conceptions of Mr. Norman Shaw, we are bound to confess they not unfrequently lose by realisation; with the exception of some feature or moulding that captivates our fancy *per se*, but which would be charming wherever we saw it, we may pass from the work as a whole with more of the impression that it was an excellent embodiment of the antiquated than a truly architectural product of the age. Possibly the artist would deprecate the idea conveyed in this last phrase, and thus, indeed, he would be joining issue with us on the only intelligent ground possible. The question between the modern artist of the representative and re-representative school would be this, that the former maintains for art a *modern* expression, and the latter an antiquated one. In justice to Mr. Shaw, as an exponent of the latter, we admit that few have shown themselves greater masters of easy and picturesque reproduction; and this, in our opinion, constitutes the very success of that gentleman’s work. We see no straining after piquant effects; his walls are broad surfaces dictated by the plan, the chimneys rise without a twist, or a distorted effort to make them appear somewhere else than where they actually occur; the gables are the unstudied result of simple roofing, and any piquancy of grouping seems to be the result of conditions rather than the endeavour to look clever. Though there is a rural simplicity, that almost seems a little too primitive and nonchalant, it is constantly an effortless working out of the plan. In these respects the art, though antiquated, is consistent and thoroughly artistic. We cannot assert the same of the works of many others of the school to which we are referring. There is often a forced kind of expression that, while it destroys the energy of the design, renders it simply absurd. For instance, how commonly the study of the designer is apparent in making a group of chimneys or gables picturesque by a variation in their

forms, without the consideration that by so obtaining effect the very idea of piquancy is destroyed. He is like those rhetoricians who constantly employ antiquated or foreign words, and who thereby destroy or modify the very effect they wish to produce. An idea of artifice is, we contend, the modern vice of the school we speak of. Picturesqueness is made the study of the artist, instead of being the natural outcome of skilful planning, pleasing grouping of features and light and shadow. Neglecting this only truthful method of design, he superadds afterwards what should have been first in view: we need hardly add, the effect is incoherency, caricature, or jumble. Bits of gables, useless breaks in the walls, little fancies obtruding here and there, windows varied in outline, show the artist has been endeavouring to produce a piece of accidental quaintness, instead of designing the truthful. But all this capriciousness, in proportion to its absurdity, defeats the end in view. If the essence of architecture is picture, then we have nothing to say; if it is artistic building, it comes under another category.

Now, if we take the broader school of architecture, or the “representative,” in which we must include the works of our leading Gothicists, we note those of Mr. Waterhouse, Mr. Pearson, Sir Gilbert Scott, Mr. Street, and a few others; we are obliged to admit that the sentiment—or what is sometimes called “feeling”—displayed, is far more generic; the features are strung together with more consistency and sometimes rhythm—in one word, there is less singularity and individuality. We by no means undervalue the quality; but we consider that the tendency of all good art is to conform to a central type. All great periods of art have centred round types, in styles as marked off on one hand from eccentricity as they have been from mannerism. Just as in the phenomena of crystallisation, the nature of the molecules determine the mode of crystallising; so in architecture, the units—or what we may term the fundamental elements of architectural composition—will ultimately form an aggregate or a central type. Though modern architecture is not, as formerly, the expression of a dominant oligarchy, though the interests that now sway the designer are a thousandfold more numerous, and though the materials he has to utilise are more varied and multiform, yet these are influences that, under masterly hands, will assume orderly arrangements—well-defined features out of chaos. Our most satisfactory buildings assure us of this—that, in proportion to the restrictions and conditions under which the architect works, in that degree they fall into definite styles—that is to say, their features, as the windows, doorways, and wall decorations, assume defined types and combinations. Our public buildings and City warehouses have, we contend, been gradually leading towards the horizontal-featured Renaissance, if we may so qualify the type, in spite of here and there a solitary resistance to the law of evolution we have prevised. Our business architecture will be found invariably to assume this type, and it is not difficult to account for it. Let us look at the conditions of the problem. There is generally restricted area or site. What does this entail but reduction of wall, till it begins to partake more of the pier? It must be remembered that lighting has always exercised a considerable influence on architecture; hence, in crowded cities, like London, the architect has had a constant struggle between his wall and his openings. It is not hard to discern that the compromise would lead to the pier as the modified type of the wall. If we traverse such thoroughfares as Gracechurch-street we find the buildings composed of piers and

well-marked horizontal divisions. The masonry is reduced to a mere framework in some cases, to secure the requisite light. It is impossible not to see to what type of architectural style this leads. An arched style always needs wall and lateral support, and whenever we see a narrow street-front, crowded with pointed or round arches, we are always disappointed with the result; it looks as if the architect had endeavoured to get effect with a feature that, however well suited to a large building, with plenty of wall, was positively starved in such a position. No wonder that such circumstances have favoured the employment of forms like those of the Renaissance and Queen Anne, in which the pier and the square-headed aperture are the main features. Hence also the same law of modification has transferred the interest from the windows to the supports. The necessity for large and unobstructed openings has been the death-blow to the tracery window, which was so overdone during the Venetian-Gothic mania which raged a few years ago. Sir Edmund Beckett calls the Italian Gothic the “shadowless style;” it certainly possesses a little of that character in its wall surfaces, which are unusually flat, and sometimes destitute of all relief. No sane architect would ever have dreamt of substituting it for our own vigorous Gothic; its interest centres in the wall, and the openings are far too small and inadequate for our dark and gloomy atmosphere. The result has proved the *à priori* conclusion some architects held: its small traceried windows were quickly found to be ill-adapted for our commercial structures; its surface decoration soon became blackened with soot and rain, and it quickly died a natural death in this country. But the main reason of its not surviving in this country was, that it was a style that had grown in and adapted itself to a sunny climate, in which all the labour of the polychromist and mosaicist had been spent to cover large wall surfaces with absorbing masses of colour. Our business architecture, on the contrary, seeks to get as much light as possible, and to reduce the wall surface. Another feature which has shown the modifiable tendency of use to a still greater extent is the roof. The Greek purist sought to reproduce the flat invisible roof, but it quickly gave way from its unsuitability to our climate. Here was another mistaken importation from the East. Our representative architects now have tacitly agreed to the moderately high-pitched roof of the Renaissance; in the Queen Anne the roof is made a feature of considerable effect, and generally it may be regarded as the type best adapted to our wants. Internally, too, it may be considered that the inner ceiling or waggon-headed roofs of our churches have supplanted, both from economical and sanitary considerations, the heavily-timbered open roofs of the Gothic revival. In the matter of chimneys also the tendency of our architecture has been to adopt the high stack and make it a visible feature. This has been dictated partly by necessity and partly by the requirements of high roofs. Again, the use of gutters has lately introduced the parapet, and we might extend the same law to all decorative features of building. Generally, we may affirm that modification has been influenced by the requirements of the day, the necessities of materials, area, light, and a division into stories having been mainly instrumental. The modifiable actions of long bearings, iron construction, hygienic conditions, and mechanical improvements have also tended towards the establishment of types which the practical architect cannot have failed to observe. These influences render it daily more im-

possible for the architect to assert his own preconceived fancies. Even the 17th century revivalists have intuitively adopted their favourite style in obedience to the requirements of the day for plain square-headed sash windows, high roofs, and brick ornamentation, and as long as they keep within bounds their work will be appreciated. Eclecticism, then, so long as it proceeds on the principle we have indicated, becomes a just and equitable means of design. By borrowing those features that conform to the most rigid test of common sense and fitness, we are fairly aiding the march of improvement. Let us mark another sign of architectural progress overlooked. Everywhere we find the law of adaptation resisting the individual, the whimsical, and the grotesque; the cultured artist invariably uses the most abstract and refined modes of expression; the uncultivated and the vulgar, the naturalesque and the isomorphic. The point at which sculptural art should begin is, perhaps, the nicest in the whole range of aesthetics.

THE ARCHITECT AND EMPLOYER.

II.

IN all agreements with employers the question of travelling expenses should not be overlooked by the architect. We have constant experience of the unpleasantness and disagreements arising from this neglect. Clients who employ architects from a distance are apt to disregard this item entirely; and there are many who, when the works are completed, believe that the 5 per cent. should cover all expenses. In all cases where a considerable distance separates the architect from his work, we should advise that an agreed sum be arranged for travelling, or that the journeys be paid for according to their number and the actual expense incurred. Unfortunately, this rule has been set aside by a large portion of the profession, who think they are justified in charging for time as well as travelling; and from actual experience we know that in many instances excessive sums are charged. In the professional scale, as sanctioned by the R.I.B.A., nothing definite is laid down; and this is to be regretted, inasmuch as there is now no rule to limit the unscrupulous practitioner in his charges. In the schedule of rules, issued under the sanction of the R.I.B.A., and confirmed at a general conference of architects in 1872, it is distinctly said:—"The usual remuneration for an architect's services, except as hereinafter mentioned, is a commission of 5 per cent. on the total cost of the works executed from his designs; besides which all travelling and other incidental expenses incurred by the architect are paid by the employer, who may be also charged for *time* occupied in travelling if the work be executed at a considerable or inconvenient distance, or if more than ordinary personal attendance is required." The italics are ours, and it will be seen that no limit of distance is stated so that practically an architect can charge what he likes for time. Who is to define an "inconvenient distance?" The words italicised also leave it to the architect entirely; this is unsatisfactory, and architects would do well to amend this rule. In his common-sense remarks on building arrangements Sir Edmund Beckett observes:—"I have the highest authority among architects for saying that no more than the actual expenses should be charged—first, because it is unwise for the architects themselves to weight the difference of distance with more than is absolutely necessary; and, secondly, because they are not paid by time, but by percentage, or by a fixed sum, in which they can take the distance into account if they like." Architects can fairly charge by

a higher scale for those works in which skilled labour is mainly involved and the proportion of materials small, as in cases of designs for furniture and decoration, though the Institute code does not define the scale beyond that the charge should be regulated by "special circumstances and conditions." This, certainly, is vague. Would it not be better for the architect, in the absence of a regulated scale, to agree upon a charge beforehand? Rule 4, that in works under the value of, say, £500, an ascending scale of charges should be adopted, reaching 10 per cent. for works under £100, is a judicious one, and, as we have hinted, a scale of this kind should exist also for works of a complex kind. Indeed, rules 2 and 4 of the code seem to require remodelling. As the question is often asked us, it may be necessary to inform the young architect that commission is calculated upon the total cost, valued as if the materials were all new, so that for alterations in which old materials are re-used, the percentage should be reckoned not on the contract sum, but upon a fair valuation of the work done, as if the materials were all new. The justice of this is obvious, for the architect spends as much time and skill in converting *old* as as he does new materials, often more. What special charge can be made for alterations is not stated, and it is advisable that an agreement be made. As regards drawings, it is the theory of the profession that the architect is paid for their *use* only, and that they should be returned to him; in the decision given in the case of the Government and the architect of the Houses of Parliament, it was ruled otherwise, and perhaps the architect had better come to terms about this question, though it is one rarely in dispute, and we have very seldom known old designs re-used.

As regards the question of alterations or additions, it should be always laid down in the contract that no alterations or additions should be made without the express sanction of the architect in writing, or that, if the employer desires to make any alteration, he should make the order in writing, which should be countersigned by the architect. We have known more squabbles to arise from a breach of this rule than any other in building operations, and it is very necessary that the contract should clearly state in what manner these almost invariable contingencies should be regulated. By and bye we shall refer to this in speaking of contracts; but the question has a special bearing upon the relations between the architect and employer, and it is this point we desire to dwell upon here. It is of little use mincing the matter, but few buildings are ever completed without some deviation from the plans; in some cases the alterations are considerable. Now, it would add to the protection of both architect and employer if a distinct understanding were come to—to the effect that any additions or alterations should be paid for at an agreed percentage—say, 5 per cent. Clients frequently wish alterations made as the work proceeds; but they are not always ready or willing to pay for them; at any rate, they wonder how it is that the architect has exceeded his commission, and when the explanation is given they often are more inclined to hesitate than pay. Every architect knows how frequently disputes arise in his practice from this source, and yet it is strange few adopt a plan that will at least protect them from the forgetfulness or waywardness of their clients. It is often the case that the employer gives his own instructions to the builder without informing his professional adviser; but if it was understood that every order had to be countersigned by the architect, and that he was entitled to a percentage for the same, a much stricter regard to the contract would be maintained. We desire to

impress one thing. Architects are apt to overlook the fact that there is a contract between themselves and their clients just as binding as between employer and the builder, and in spite of the protection afforded them by the code of rules, behind which they too frequently repose, and which they imagine all-sufficient to protect them, the law expects from them the fulfilment of certain duties. The fact cannot be too strongly enforced that there must always be two parties to a contract, and when a code of rules is framed the demands of the employer should be considered as much as the employed. Have the Institute always acted on this principle in drawing up their code? Though nothing, as a rule, in the shape of a written contract exists between the architect and employer, they are, nevertheless, contracting parties, and it is the safest course to agree to terms.

Our pages have lately been occupied with the important question of "quantities;" we shall therefore briefly remark here the points to which attention is necessary. By almost universal consent of the profession "quantities" are considered necessary; it therefore seems to us only fair to make them the basis of the contract, and to acknowledge them openly, instead of trying to conceal them from the employer, who, after all, has to pay for them. As the architect should have nothing to do with the financial transactions further than to certify the payments due to the builder, we contend that it is better he should employ, and that he and his clients should *agree* to employ, a surveyor to take out the quantities. By so doing all suspicion of unfairness is avoided, and the employer becomes a party to the employment of the surveyor. The R.I.B.A., as our readers know, first prohibited their own members from taking out quantities, justly seeing the evils which arose from it, and which have only recently been made the subject of public comment; subsequently, however, in 1872, the rule was modified. The practice was so general, indeed, that the Institute found it impossible to sustain a rule they could not enforce, and they proposed that the employer should pay the architect for the quantities instead of paying the contractor. But this was objectionable for many obvious reasons. A recent and further modification of the rule has been proposed, by which the quantities are to be prepared an independent surveyor, appointed with the concurrence of the employer, and we believe this to be the only just course, notwithstanding the advice of some who advise employers not to recognise the quantity surveyor. The quantities should undeniably form part of the contract. There should not be a suggestion of suspicion cast upon the architect on their preparation, nor should he be made chargeable for omissions. Many in the profession make a considerable emolument from quantities, and for this reason we must account for the opposition entertained against any proposition for limiting the architect's connection with them. The recent controversy has been waged between those who believe the architect should primarily protect his client, and be thoroughly independent, and those who see no harm in making an additional 2½ per cent. on quantities supplied to the builder. Further, we contend that any one who supplies the quantities should guarantee their accuracy to the contractor. Architects, as a rule, endeavour to protect themselves from this risk by a clause in the contract—hence the exorbitant percentages added by builders in many cases, which the employer has to pay.

In relation to this question it may be desirable to mention that the employer is liable for the quantities, if, after he receives tenders founded upon them, he abandons the intention of proceeding with

the work. In all cases we should suggest the desirability of making an agreement with the quantity-taker to charge a fixed sum in case the work does not go on. This is only fair, because in such a case he takes no further risk.

In advertising for, or inviting, tenders, the usual clause, "the lowest or any tender is not necessarily accepted," is a safe one; for if there is no such clause the lowest tenderer has a fair claim to recover for his time and labour. Besides which, the young architect cannot be too much on his guard sometimes. Many men tender for a work which they are quite incompetent to undertake, and it is the duty of the architect to see that he is not making a contract with a man of straw, but with a responsible individual. He should invariably require, before the acceptance of the tender, that the builder be able to find the necessary sureties—one, two, or more, as the work demands, for the due fulfilment of the contract. One-third of the amount of tender is not too large a guarantee in ordinary contracts, when the contractor is not known as a safe man. It is usual for a contractor to allow 25 per cent. to be withheld from the amounts due to him at each instalment; and, of course, such a condition should form a part of the contract, and a contractor of any standing or reputation would never object to this reservation. We caution the architect in all cases against accepting a tender too hastily, but to do so only with a proviso, remembering a tender and the acceptance constitute an agreement in law. With all tenders a schedule of prices should be given in—at least a list of the principal kinds of labour and materials like excavation, concrete foundations, brickwork, timber per cube, &c., by which any additional works may be fairly estimated, or any deductions made. This is a requirement, however, seldom insisted on, and unless the architect sees to it he never gets one. Sometimes the priced bill of quantities is enclosed and sealed and given into the architect's keeping for this purpose. A schedule, however, is the best. We may mention a rather important case here in reference to the acceptance of lowest tenders—a question that is constantly being put by correspondents. The plaintiff was a builder, and, amongst others, had plans sent to him for tendering. His tender being the lowest was thought, according to custom, the accepted one; and, as usual in some cases, the hospitality of the plaintiff was indulged in by the other builders and the architect. Afterwards the defendants denied the authority of the architect to accept the tender, and refused to employ the plaintiff. The judge ruled that there was an acceptance and perfect contract, and this decision was upheld on appeal.

AUTOGRAPHIC ART IN THE BRITISH MUSEUM AND THE ARTIST-WORKMAN.

IN the effort and in the hope of being able to aid the artist-workman in his, if at all successful, arduous work, it is somewhat difficult to find out what best to select as most instructive. It is to be recollected, in the very first place, that the position of the art-workman in these our modern days is a very different thing indeed from that of his position and mode of work in the antique Greek or Roman times, or in that of the Gothic times and middle ages, or in the Byzantine days, or even, for that matter, in the days of Christopher Wren and Inigo Jones. We might here go further and call to mind the doings of the artist-workman all the wide world over, from the very earliest and rudest efforts to those of the most refined and finished work to be found of any date. They will all of them

go to prove the one great and material fact in art-history—viz., that they are not in any sense copies of older and previous work, but are original thoughts, and the practical embodiment of such original thoughts, and that they are, too—and this is quite as important and momentous—the result of individual art-power in the executive artist and workman. It would be very difficult, indeed, to find within the compass of art a subject more important and influential in all its bearings than this, certainly to the executive artist and workman. No matter what the style and manner of the art produced may happen to be, or what the subject of it, the very first requirement is that it be autographic.

It may, therefore, be of interest to many of our art-workmen to point out to them some of the peculiarities and beauties of the work of past ages, and to indicate the probable way in which such work was accomplished, and to note the probable position of the artist-workman in days of yore, and before the triumphant power of machinery had been brought to bear on art-work; and then, and which is more important than all else, to that division of labour, minute and detailed as it now so often is, which enables the workman of today to accomplish so much in a given time. No two modes of work and action can be more diverse than are those of the past and present, and while looking at and attentively and closely studying the art-workmanship of the past, it seems not a little strange that this difference has not attracted more attention than it has hitherto done from those who have written and thought so much on the history and workings of fine art. Indeed, it might be a little difficult to point out any source wherein it has been systematically treated of, or even alluded to, as it so well deserves to be. This is a very curious fact, and well illustrates and exemplifies what Sir John Herschel has said in one of his essays:—"That so very much is lost by our ignorance of what is and what is not of primary importance, though not at first sight quite obvious, of what ought to be diligently noted, and of what may be allowed to pass without notice." And that it is this which makes, in the first place, a "theory" of so much moment. It gives, he continues, to a collection of mere feelings, impressions, and scattered thoughts in the mind the power of presenting these to it as a coherent whole.

No one will dispute this dictum of Herschel's who will look into this special subject with sufficient attention, and give sufficient thought to it, and will at the same time refer to that past state of things wherein other methods of work prevailed, all so different from the present. In the British Museum this may be well studied, and, if there be a difficulty about it, it will be found, not in the fewness of the proofs of it, but the many, and in the choice of what is most instructive and to the purpose. One great difficulty there is, and it is a most unfortunate one, the British Museum collection contains but very few, if indeed any to our present purpose, examples of the Rouanesque or the Gothic, either of architecture or sculpture, or of the details of either. Why is this? There is not either a good specimen of the art or the architecture of the Renaissance, to use that somewhat indefinite term, or Italian, either Continental or English. We say nothing of other and more out-of-the-way styles of art. It must, truth to say, be taken as it is, and the best be made of it. We might refer here, as filling up partially this gap, to the collection of the Architectural Museum, Westminster, almost exclusively devoted to Gothic art in its several phases. The time will doubtless come, though it may be a distant one, when such collections will come

together, and thus form a connected whole, thus to exemplify the long history of past art and architecture. But in these days unhappily the hindrances are not a few to concerted action, however desirable.

We might thus go on with our lament, and can hardly forbear, there being so much that is needed even for the small purpose which we have here in mind. There is practically—strange as it may seem in such a well-endowed establishment—no catalogue of antiquities, for the few leaves of printed matter sold as a catalogue makes no allusion in detail to the separate objects. These objects, as in the Egyptian galleries, have many of them two or more numbers on each one of them, and sometimes none. This catalogue, by the way, is quite a curiosity of its special kind, and the student should certainly provide himself with one, not to refer to maybe, but to note in the margin what it is he wants to know. We hope to help him here, and to refer to some of the fine examples of art-workmanship in detail, affording names when possible. A capable workman, not simply looking at these fine works, but earnestly studying them, will be right well rewarded, and will, we cannot but think and hope, be in no long time able to distinguish between the true and the meretricious in art, and between that art which has been the result of manufacture and that art which has, as here, been the result of the thought and personal handwork of the artist-workman. This is worth almost any amount of painstaking, and will amply reward it. We would mention here in passing that, if possible the student should provide himself with one of the old "Synopsis" of the Museum Collection, the first edition of which appeared so long back as 1808. It has unfortunately been superseded by the present so-called Guide to the collection.

But we must needs take things as they now are, and make the most and the best of them, and get help from what is about us, however much we may regret its deficiencies. And, in the first place, missing much, we would call special attention to a really remarkable series of impressions or casts from Egypt, but within a few days open to public view, in the Egyptian galleries of the British Museum. They are contained in a series of wooden panels, fixed into the east wall of the central Egyptian saloon, unfortunately under a window light, so that they are but very imperfectly seen, there being, consequently, no direct light on them, and no shadows thrown. These fine examples by the artist-workmen of old Egypt deserve a better fate and place—a good side light and an eye-level point of sight. They are large, life-sized hieroglyphics, incised into the stone, and are alike admirable for the drawing and expression of life and individual character displayed in them. Fragments, most of them of human heads, of divers nationalities, by the way, and animal forms, the birds peculiar to the country being especially striking in accuracy of drawing and outline. The human heads, too, are admirably cut out of the hard stone—some of them in relief, and the peculiar still and soft expression of the Egyptian faces admirably caught. We can hardly point to special instances, the panels containing them not being as yet numbered; all are worth attentive study. The profile of the Pharaoh, close to the floor, and another over a doorway, are, it struck us, especially fine, and admirable specimens of artistic skill of hand and eye and memory. We could well dwell on these fine works of the Egyptian sculptor in detail, and even compare them with some of the Greek work not far from them, but must forbear; for the time, it is to be feared, is hardly yet come wherein individualised art-work is duly cared for, except in painting. But the time

will certainly come when this will be so; and then such work as this will attract students, not for the sake of its antiquity and historical import simply, but for its display of artistic power and import. We may note, too, that these plaster casts have not as yet been tampered with in any way, or, what is as bad, coloured or "painted;" so they fairly bring the actual work and workmanship before you. They deserve indeed, as we say, a better place than where they now are, and a better light.

It is to be observed that these stone carvings are not—any more than another example we propose to cite—the result in any sense of copyism from previous art-work or from the work of a, at the time, past age, but are evidently transcripts from living forms and then present impressions. The old Egyptian copied the life and occurrences then about him, and in his own individualised way, *i.e.*, in his nationalised and own way. We see here his veritable "handwriting" on the wall. We can hardly, therefore, point out to the stone carver and artist-workman, even in the Museum, finer or simpler examples of drawing and stone-cutting; and they are as living to us as they must have been to the Egyptians. It would be, indeed, a great point gained if our art-workmen could be induced to feel intelligent interest in the British Museum collection of art, for there is nothing within the ken of the British workman comparable to it. There is so much, too, that is as yet really genuine and untampered with.

We will now, without going further, but just point to another remarkable fragment of Egyptian work, unfortunately within a glass case, so that it is a little difficult to look at and study. It is the well-known "Rosetta stone," as it is called. It is of the hardest of black marble-cutting, and might well be left to itself minus the distracting plate glass case. It has puzzled not a few of the learned, and is simply a stone page of a book, and contains a trilingual inscription, and is noteworthy here as an example of marble-cutting, and as evidencing how the ordinary and common "lettering" of the age can be made artistic, and possess interest as art-work. It is, indeed, writing with an iron pen on stone, and the artist-workman or marble-engraver who did the work must needs have been a skilful workman, and well up to his work. It is a pity that his teaching cannot be followed now-a-days, for there are surely many opportunities where this "writing" on a building might well be followed. In the place of utter meaningless now-a-days-copied "ornament," to be seen all about us everywhere on the wall surfaces of new buildings, might not the skill of the art-workman be more advantageously employed in writing "inscriptions" on modern buildings in readable "lettering," and might he not, here at least, exercise his own artistic power and invention in such work? That the artist-workmen of Egypt did this is quite certain.

RULES AND DATA UPON CONSTRUCTION*.

BOOKS on the strength of materials and the rules and tables founded upon experiments, are getting so numerous that our shelves are beginning to be overwhelmed by them. In fact, when we want to make a reference it is difficult to know which book will give us the best or the most concise information, and we may look through half a dozen without finding what we want. From Tredgold and Barlow to Rankine and Downing, we have a profusion of rules and formulæ that are perplexing, if not distract-

ing, and if we compare them we find the results so different that for practical purposes the architect or engineer must rely upon his own experience or calculations. Mr. Daniel Kinnear Clark, M.I.C.E., has published another voluminous work upon the subject, in which the author has concentrated the labours and experimental results of recent authorities. This bulky volume professes to give the best information with conciseness and scientific accuracy. From a general glance at its pages we are inclined to think its author has been pretty successful; at any rate, we find the information tolerably well compressed and arranged, and the rules and formulæ divested of unnecessary symbols. Passing a very comprehensive epitome of geometrical problems, mathematical tables, weights, and measures, we come to a useful division of the book on the weight of metals. We there find it stated that wrought iron varies in weight for different qualities from 466lb. to 487lb. per cubic foot, the average usually taken being 480lb. For a square foot lin. thick this weight gives us a very convenient and easily-remembered number, or 40lb. Dividing 480 by 1.28 we get 377lb., usually taken as 380lb. per cubic inch. Of cast iron we find the cubic foot is stated to vary from 378 $\frac{1}{2}$ lb. to 467 $\frac{3}{4}$ lb., the average being 450lb., and the weight of a square foot lin. thick 375lb. The tables furnished by Mr. Clark are ample, and amongst them is given a very useful table containing the weight of prisms or bars of iron and other metal of any uniform section from 1 square inch to 10 square inches of section, advancing by one-tenth of an inch for 1ft. and 1 yard lineal. This will be found of great value to architects, surveyors, and others in building, as bars of any section or form can be estimated by its use. To find the weight of wrought and cast iron, and steel from the volume is also of considerable advantage, and numerous multipliers for this purpose are given. Thus, if we want to find the weight of wrought iron, when we know its volume in cubic feet, we can do so by using 4.29 as the multiplier, and the product will give the weight in cwt. For cast iron 4.02 is the number to be used. When the quantity is superficial one inch in thickness, the following numbers are useful to remember:—Multiply area by 40 for wrought iron; 37 $\frac{1}{2}$ for cast iron; and 41 for steel; the product is the weight in lbs. The following rules, too, will always be found handy to carry in the head or waistcoat pocket, and we quote them:—When the sectional area in square inches, and the length in feet, of a bar are given, multiply the sectional area by length, and by 34 for wrought iron, 34 $\frac{1}{2}$ for cast iron, and 3.4 for steel, and the product will give lb. weight. For large masses the sectional area, multiplied by the length, and divided by 672, will give the weight in tons of wrought iron; or by 717 will give the weight for cast iron. These instances will be enough to show the practical value of Mr. Clark's book to those engaged in calculating the ironwork of structures; they will, at least, indicate that every day rules have not been forgotten. Again, rules are given by which, from the length and total weight, the sectional area may be obtained, or vice versa; but we pass on to notice another division of the author's work of special interest to those engaged in construction—namely, the strength of materials. By the way, we notice a preliminary chapter on "Mechanical Principles," which appears to be a pretty succinct statement of the leading propositions, in which the author has borrowed freely from the excellent treatise of Professor Moseley, a work we remember as one of the first, and whose illustrations we see have been reproduced, but the author does not appear to have elucidated

one important method of mechanical analysis, that known as the graphical process. It is rather an unphilosophical arrangement to insert the subjects of "Heat" and "Steam," "Fuels and Coal," before the "Strength of Materials," which should certainly have followed "Mechanical Principles."

In speaking of the transverse strength of homogeneous beams, the theory of transverse stress is amply illustrated, and the question of "diagonal resistance" is entered into, though we confess it is not very clearly stated. It is said the normal resistances, or those usually considered above and below the neutral axis of a beam, are supplemented by diagonal resistances, by which each of them is augmented 75 per cent. This is a doctrine quite new to us, and to many. What we have always considered to be the "diagonal resistance," in the sense here explained, has been met by assigning a sufficient resistance per unit to the generally conceived stresses of compression and tension. The author graphically investigates these diagonal forces, and shows diagrammatically the diagonal stress in the section of a beam, by which the combined areas of stress are shown to be equal to that of the semi-rectangle; and it is therefrom deduced that the tensile and compressive resistances act at a resultant radius measured from the neutral line of beam 1. Again, "as 5775 is the geometrical radius of gyration of the semi-rectangle on the neutral axis when the half depth = 1, the moment of resistance will, for simplicity, be taken as 5775;" or, in other words, the total moment of either tensile or compressive resistance with reference to the neutral axis, is expressed by the product of half the sectional area of beam by half its depth and by 5775, and by the extreme stresses per unit of area, or, if we call s the extreme tensile and compressive stress per sq. inch, we have

$$\frac{bd}{2} \times \frac{d}{2} \times 5775 \times s = 1444 bd^2s.$$

and the sum of the moments of resistances (tensile and compressive) is practically twice the moment round the neutral axis. We are disposed to think, though the theory is rational, that the diagonal stress is more a refinement of the theory of flexure as generally explained in works on construction, and may with advantage be disregarded in our practical treatises. If we consider the resistance of the fibres to be in proportion to their distance from the neutral axis, or to their areas multiplied by the squares of their distances from the axis, we obtain all that is necessary. We pass over the usual formulæ for beams with the remark that we see scarcely enough reason to change the term moment of inertia for "radius of gyration," though perhaps the latter term may be quite as intelligible to the mechanic. Flanged or hollow beams are investigated, and we have the following rule for a I-shaped girder, when the depth is considerable compared with the thickness of the flanges: Multiply the sectional area of one flange by 4, and multiply sectional area of web by 1.155, add the products together and multiply the sum by the depth of beam and by tensile strength per square inch, and divide product by the span; the quotient is the breaking weight." Beams of unsymmetrical section are discussed—a subject of some importance when we have I and L shaped beams in every-day use, the difficulty being to determine the neutral axis of the section. A good rule is laid down to enable the computant to find this. Beams of uniform strength are considered, and the variables pointed out. We notice a clear statement of shearing stress, and the diagrammatic means of measuring it—a subject that has been thoroughly worked out by

* A Manual of Rules, Tables, and Data for Mechanical Engineers, &c. By DANIEL KINNEAR CLARK, M.I.C.E. London: Blackie and Son, Paternoster-buildings.

Mr. Stoncy, Mr. Humber, and others. In a subsequent part of the book rivet-joints, cast and wrought-iron flanged beams are discussed, the conclusions of Hodgkinson, Laslett, Kirkaldy, and others being abstracted in a useful form for reference. In "framed work" we have girders, roofs, and trussed forms dealt with—a subject of great value to architects. We have simply glanced at those parts of Mr. Clark's work which are of general interest to our readers, though it embraces every branch of the mechanical engineer's work. In conclusion we commend the book to all interested in construction, as the most comprehensive work on rules and data we have seen.

NATIONAL COMPETITION DRAWINGS AT SOUTH KENSINGTON.

THE art-talent of this country is nowhere better displayed than in the annual competition of drawings contributed by the various schools of art. The present exhibition at South Kensington appears in every department equal to the last year's display, when there were exhibited 1,100 works, selected from 257,926 productions. Imitative art holds the highest place, as usual, for we find by far the most striking works in this division; design being mainly represented in lace, embroidery, and other decorative branches. As for architecture, it is quite at a discount, and one small screen contains all the architectural skill the examiners have thought fit to represent. We are inclined to think that even here they experienced a difficulty in making a choice, for we find scarcely a design that indicates a just conception of architectural composition.

Beginning with the 3rd grade prizes, we find the water colours certainly up to the average for minuteness of delineation, careful manipulation, and colouring, though in composition and generalised effects of colour, the collection fails as a rule. It is too evident, in looking over these groups in water colours, that mechanical merits have been reckoned rather high compared with the perceptive power of the artist. Execution has been taught before outline in some instances. If the acme of art-skill is the art of conveying an impression of form with the least visible effort, then we consider the bulk of the works at South Kensington, as representative of our art-schools, to be a failure; but if the perfection of imitative art consists in the power of placing lines and tints in exact imitation of the texture of the object to be represented, they may be said to achieve this object.

The National Gold Medal (3rd grade) is awarded to the Lincoln School, for a group consisting of a jug, plate, oranges (some peeled and divided), and a melon, against a deep-toned background. We cannot find fault with the composition of this piece; the oranges and the ewer and glass are excellently truthful. The initials, "S. M.," are marked upon the drawing. Under the motto, "Honori," the West London School has certainly not come up to the Lincoln work, though a gold medal is awarded. The composition is a group of apples and holly, defective in outline and mass. The spray of holly is carefully drawn, but wanting in the qualities of pleasing grouping; the leaves are too open, and there is a want of shadow and solidity in the piece, that makes it fall far short of "Ars Longa," Leicester—a subject that has greater claims to distinction. The National Silver Medal is given to a grouping in which a jar turned on its side is shown with some dates—a work of merit, and free from the defects we have pointed out. It is a Bloomsbury contribution. The bronze medal is also awarded to Bloomsbury female school, for a clever though rather weakly executed study of white and pink May blossom in foliage; the motto is

"Conquiesco." Of other works we note "Onward," Nottingham—a well-conceived group of blue vase, pine-apple, with a background of drapery and open woodwork. The piece which has gained the National Book Prize is certainly not, in our opinion, so successful, though the same subjects are chosen. "Lux," Exeter, takes a National Bronze Medal. Lincoln stands very high this year, and, if we remember rightly, the same school carried some good prizes last year. In oils Lincoln wins a gold medal for a cleverly-executed group; and Portsmouth also, in the person of Mr. John Parkinson, takes a gold medal for a similar composition in still life, in which richly-feathered fowl are lying upon a deal table, a cauliflower and a plate of the willow pattern being very naturally placed in the background. The brown jug, and the plumage of the birds, with the knife lying partly under them, are exquisitely true as copies. The Exeter school, motto, "Tempus," sends another very faithfully-rendered grouping, in which are chiefly to be noted a richly-carved ivory cup, with gilt cover, of the Cellini type, a bowl of fruit, and other accessories, on a rich Oriental mat, the execution of the latter being remarkably realistic. The silver medal in this class is taken by Portsmouth, in which game and vegetables are blended, the contrast between the leveret, the cabbage, and basket being happily managed. Still life seems to be the favourite kind of composition in our art-schools; it may be just worth the remark, however, that in such subjects discrimination in the selection of objects is not to be despised. To bring together a promiscuous assemblage of dinner service, old boots, broken crockery, vegetables, &c., does not help to form the student's taste in composition, even if it gives variety, and exercises his power of delineation. The Bloomsbury female school, which is well represented, receives, among other prizes, a bronze medal for a nicely-drawn and coloured study of primroses, but the composition lacks coherency—a fault frequently noticeable in ladies' works. A clever and effective piece of chiaroscuro takes a National Book Prize, the leading object being some herrings, surrounded by a mélange of worn-out articles worthy of a marine-store dealer's collection. We cannot understand the principle of award in some instances. Thus, "Labor," North London, and "Omega," Preston, go without reward; two excellently coloured subjects. The latter is especially a clever study of a carved cabinet, against which at one side rests a bronze platter, very admirably rendered in the reflected light, a blue jar making up a very pleasant study of colour harmony. This piece, placed on the ground, contrasts rather remarkably with the picture above it—a flower composition as remarkable for a confused treatment as the subject just noticed is for breadth. We may notice a group of pansies to which a book prize has been given; a group of eggs and onions, by "Strive," a well-composed contribution from the Edinburgh female school, &c. In another branch of study, the oil portraits, we note Lincoln stands well. "Tempus" is the motto of an excellently-painted girl with dog, and there are some capital studies of portraiture. The Silver Medal is awarded to "Tempus," Lincoln, for the head of an old friar, with hood, reading a book. The aged countenance, full of wrinkles, and the light are cleverly handled. The Training Female School, Kensington, exhibits in this class a well-drawn side face of a woman; the Bronze Medal is awarded to "Ars non Vis" (St. Martin). The chiaroscuro of some of these is admirably studied, and the portraits are truthful, particularly two women's faces we have noticed, where the effort has been to depict the lineaments of common life, not the

ideal beauty. Altogether there are about a dozen and a half well-studied portraits.

We pass on to notice the few architectural drawings. We see a bronze medal has been bestowed upon a design for a church bearing the motto "Onward," an over-florid Gothic attempt, characterised by a large central tower and spire at the crossing, and an apse surrounded with gables in a very unmeaning fashion. Though the detail is not bad in some parts, there is a misdirected effort throughout. Another bronze medal is awarded to a metal screen for a cathedral (Leicester school), the student being Samuel P. Pick. Here we have one of Sir Gilbert Scott's designs, heavily treated in parts, as in the lines of the gables, though the drawing appears carefully done. A third bronze medal is given to a design for a country mansion—a Renaissance treatment, and decidedly the most deserving work on the screen, with all its faults. It is contributed from South Kensington. "Tempus" is the motto of a study in colour, showing the interior of a cathedral, with some well-rendered details. The Bedford Church Institute contributes an extravagant town hall in a florid Gothic. The cause of failure in this class is undoubtedly the persistent, though absurd, notion of giving such extravagant themes as town halls and cathedrals to the young student. Such a mode of studying architectural design must invariably lead to the same results as learning drawing by placing before the student finished antique sculpture and the *chefs d'œuvre* of the great masters. Some of the other designs we shall describe next week.

WROUGHT-IRON GIRDER-WORK.

IN a paper read before the Liverpool Engineering Society last month, Mr. C. Graham Smith, the President A.I.C.E., referred to some important questions touching upon wrought ironwork. It is well known theoretical strains are considerably modified by the practical details and modes of manufacture. Something more, the author observed, is required than a knowledge of the principle of the lever and triangle, or polygon of forces, in order to design wrought-iron girder-work. The aim in all designs ought to be to so arrange the parts that there may be as little departure from theory as possible, the main points of which we may briefly refer to. The author cautioned his hearers against the fascinating theory of uniform stress, or that in any arrangement it was possible to obtain uniform strain throughout an iron structure. It was shown that the usual hypothesis on which strains are calculated supposes a normal length, whatever the load put upon the member, and that the strains are the same as they would be were it free to turn in a plane about its extremities. This assumption amounts to considering every joint to be a frictionless pin-joint, and the material of uniform texture and rigidity. Taking a roof principal as continuous, instead of having frictionless joints over every strut, we find this assumption to be quite wrong. Such a principal is often strong enough to stand with half the trussing, as the strains in the ties and struts are reduced by the resistance to deflection of the principal. In English girder-work the connections instead of frictionless are rigid and rivetted. American engineers use the pin-connection to a large extent, and if the pins and eyes are properly proportioned, theory may be more closely approached than with our complicated lattice girders with rivetted joints. American engineers pride themselves on their scientific skill in economically distributing their material, believing that a certain amount of material put into one member will do much more work than the same quantity distributed over two or more members. The sun is said to be the worst of the many things that invalidate theory. The author refers to Mr. Clark's description of the Britannia Bridge, showing how sensitive the tubes are to changes of temperature. Half an hour's sunshine upon them "has a greater effect than is produced by the heaviest trains or the

most violent storm." They are said to be in a state of perpetual motion. The expansion of the top flange by the sun, and the contraction of the bottom flange by the effects of the cool wind, cause the bridge to rise to an extent exceeding the deflection caused by the heaviest load. In the Mersey Dock the top flanges of the bridges are painted white to obviate this effect as much as possible. It is shown that, assuming the difference between the ordinary extremes of temperature is 82° Fahr., and a change of 150° induces a strain of 1 ton per square inch of wrought iron, a variation of the above extent will produce a strain of $5\frac{1}{2}$ tons per square inch. The protection of paint, and the fact that the extreme of temperature only acts during a short time of the day, reduces this strain, and an allowance of $\frac{1}{10}$ in. for each 100ft. in length is found sufficient in England. As iron within working limits stretches about $\frac{1}{100000}$ of its length for each ton strain per square inch, it is found that the strain per square inch, without proper provision being made, will be to 1 ton as $\frac{1}{27143}$ (the allowance given) is to $\frac{1}{100000}$, or equal to a little over $3\frac{1}{2}$ tons per square inch. The author thus points to the fallacy of those engineers who cite cases where bridges have not moved at their abutments for years, through rusting of the bed-plates, overlooking the loads that have been borne. Again, the screwing up of small rods by one man may often double the strain, and exceed the limit of elasticity of the iron. In such cases, destruction is only a question of time. Mr. Smith defined the "limit of elasticity" practically as that point up to which the same strain will not produce an increasing permanent set, however often repeated, and for good iron this limit may be taken at 8 or $8\frac{1}{2}$ tons per square inch. If, on repeated applications of a strain, a bar continues to elongate, the limit is exceeded, and the safety of the structure is only a matter of time; hence the giving way of some railway bridge, though it may have stood a long time, is not an improbable accident.

Some very practical advice is given in apportioning the proper amount of material to meet the strain. One point is, to employ iron chiefly of the economical sections, weights, and lengths obtainable in the iron market. Though generally specified, Staffordshire iron is seldom employed in girders, it being small in size at the prices. Thus, South Staffordshire plates to cost the ordinary prices ought not to be over 4cwt. in weight, 15ft. in length, 4ft. in width, but at an additional cost of £5 per ton the plates may be had up to 20ft. long, and 7cwt. weight. Angles, tees, and other rolled sections can be had in lengths up to 30 to 35ft. without extra cost if they do not weigh more than 4cwt., and the sum of the sides do not exceed 8 or 9in.; larger sections, such as H-iron, will be about 20 per cent. more. Bars without extras must not be more than 6in. wide, though they are rolled to 8 or 9in. at a small extra cost. These market limitations, it is shown, considerably influence designs for ironwork. Thus a girder for a span of 68ft., to carry a load of 12 cwt. per foot-run, requires to be about 5ft. 6in. deep; but as plates cannot be rolled above 4ft. 6in. at a reasonable price, this lesser depth is selected, and other considerations are set aside. For complicated forgings, the best Yorkshire iron, such as Low Moor, Bowling, and Farnley, is recommended; but for ordinary girder work Lancashire, Welsh, and Scotch, and north country manufacturers supply a material of sufficient quality. It is said the Cleveland district is fast becoming the principal iron centre of manufacture. As the plates are sometimes very brittle, extra care should be taken to test the quality of the iron. Ship plates are looked on with suspicion by engineers, as shipbuilders are not very particular as regards quality, and they are the cheapest iron in the market, notwithstanding their size. To guard against bare or thin plates it is best to specify that $\frac{1}{2}$ in. plates shall weigh 20lb. per superficial foot, and other thicknesses in proportion; an allowance of 5 per cent. for iron above $\frac{1}{2}$ in. thick, and $7\frac{1}{2}$ to 10 per cent. for iron below that thickness, is usual; but payment should not be made for any increase in weight above that specified. The author says it is next to useless to specify for certain brands of iron with the object of getting a definite

quality as in ordinary iron, the "best" of one maker being often equal to the "best best" of another; and testing is the only means to resort to. Mr. Smith alluded to the rashness of the so-called "practical man" in these matters, and said that no engineer need hesitate to own that he is unable to determine the quality of iron by its appearance. As to strains, 20 tons per square inch and 6 per cent. elongation with the fibre, for plates; 22 tons per square inch, and 9 per cent. for elongation, for angles and tees; and 24 tons per square inch, and 15 per cent. elongation, for rod iron, are not too high for ordinary iron. The plan of comparing the original and fractured area after testing, specifying that the latter shall be less than the former by a certain percentage—say 10 per cent., specified by some engineers—requires more care than usually bestowed. It is shown that in small sections, as bars $\frac{1}{2}$ in. square, a very slight error of measurement, say of $\frac{1}{100}$ in each dimension, would show a contraction of area of 6 or 14 per cent., instead of 10 per cent., according as the error was deficient or in excess. Another reason for preferring the "elongation" test is that iron plates are not always uniform in quality throughout. Some useful hints on testing were given. Thus, in preparing test samples, all tool marks should be filed out. A nick in the iron causes fracture to take place at that point, and the tensile strength is not obtained fairly. A good rivet should be capable of being bent double whilst cold without signs of fracture, and the heads hammered down to less than $\frac{1}{4}$ in. in thickness without cracking at edge. Lord Ward's and Galloway's rivets stand these tests. A rivet if bent should be fine, fibrous, and silky. Good iron may to some extent be determined by its texture. It should be fine, close-grained, of a silvery-grey colour. Iron of inferior quality has a coarse granular fracture like cast iron. Mr. Smith recommends that tests for tensile strength and toughness should be carried out by independent authorities, such as Mr. Kirkaldy, and not at the contractors' works. Work, too, is done by the "piece," and this is a great evil among contractors, as periodical inspection does little to check scamping. Rivets are sometimes only heated at the point, and consequently they do not fill the holes, though the rivetter can make them tight to all appearance. In structures subject to much vibration these rivets will soon get loose. Contractors can estimate the quality of work that will suffice by the style of the specification and drawings. If these are arbitrary and unreasonable, they are apt to cover contingencies by a percentage on their prices. Specifications should be clear and concise, and explain those things which the drawings cannot fully show. It should not be crammed with dimensions and descriptions which can be shown by the drawings. A clause to the effect that "the work is to be carried out in strict accordance with the drawings Nos. 1 to —" will save time of both engineer and contractor. The drawings should be as complete as it is possible to make them; dotted lines should be largely employed to explain, and cannot confuse if they are put in their proper places; such drawings are for men accustomed to complicated, not pretty, delineations. A working drawing should be so accurate and complete as not to require explanation. The pitch and diameter of rivets should be shown; also their relative position in the structure. In the construction of a bridge it is generally necessary to draw the whole or parts, full size with its required camber. This is done to give the lengths of separate parts, and the relative position of the rivets. These positions are then marked on a template, from which any number of like plates or bars can be made. Great care is necessary to ensure the accuracy of the rivets and holes, and sometimes a template is specified, the studs fixed to which in the position of the rivets are required to enter all the holes at the same time. If the holes are not true, the shearing area of the rivet is reduced. It is desirable in calculating the number of rivets to consider their diameter $\frac{1}{16}$ th less than that shown in the drawings. All rivets should have a good and sufficient head and snap. Mr. Smith warned his hearers against too implicitly believing in the economy of using rolled

sections as beams of great sizes and lengths; and inculcated the maxim that the same amount of material put into one girder will generally do more work than if distributed over two or three—first, because there are certain practical limits to the thickness of webs and position of stiffeners; and, second, because the more numerous the plates in the flanges the nearer the actual weight will approach that required by theory, and the greater the percentage of effective section to gross section. It was remarked that if the stiffeners to a plate girder are splayed out clear of the angle irons, they will cost 50 per cent. less than when made to fit close round, and answer equally well; and it was hinted that stiffeners are best put in at those points where the flanges possess an excess of strength owing to unvarying thickness. Great care is necessary in the joints and position of rivets, and the amateur designer is apt to be led away by the facility of placing them to afford ornament. The author also thinks that punched holes are not so damaging in faced iron as thought by some who specify that rivet-holes are to be drilled; and in simple joints the extra cost of drilling overbalances its advantages. Referring to the "life of ironwork," it was stated that iron embedded in concrete has been found as free from decay as on the day of its manufacture. Provided air is excluded, and at the ordinary temperature, water has no effect on iron. Ironwork should allow of inspection in every part, and modern practice has shown that box girders and cellular flanges are bygone types, to slavishly imitate which implies ignorance of modern girder work.

Referring to paints, the author said the experience of Liverpool foreman painters is decidedly in favour of lead paints, when of good quality and used with good oil without spirits. Iron oxide paints are preferred by some, on the score of cheapness and non-adulteration. Tar paints are well adapted for ironwork which is not seen, such as the floor-plates of bridges, water-pipes, &c., and for sea-work it is better than other paints in not fouling so readily. A good rough paint is made by heating coal tar, mixing it with finely-sifted slaked lime in the proportion of 1lb. of lime to a gallon of tar, adding sufficient naphtha to make it of convenient consistency for laying on. It should be applied while hot, though it should not be so much heated as to lose its essential oils. Sanding paint adds to its durability. The value of a coat of boiled linseed oil applied hot, as a preparation for after coats of paint, is mentioned. The author advises that the blue shales inseparable from the manufacture of the iron should be removed before the oil or after coats are put on. This is better done after the ironwork has been put together in the yard and tested. The author, in conclusion, referred to Professor Barff's recently-discovered method of coating iron with magnetic or black oxide. This he effects by subjecting it to steam at a temperature of $1,200^{\circ}$ Fahr. for six or seven hours. The iron so treated is said to resist a rasp, and bear any amount of exposure without any signs of corrosion. The Professor and Messrs. Penn are said to be making experiments on a large scale, with a view of testing its application to constructive purposes.

In the discussion that followed the reading of Mr. Smith's paper various speakers took part. Mr. Clanchy spoke in favour of pin joints in new countries and remote districts, where the transport of cumbersome machinery was a matter of serious expense. In up-country work skilled rivetters are not to be had. In the San Paulo and Rio de Janeiro Railway pins were much preferred for facility of construction. The general type of the bridges was that known in the United States as the Wynville truss, of trapezoidal form, with compressive members of circular section, and steel fastenings. The time occupied in erecting a 20 metre (65ft.) span bridge, with a gang of fifty men, was generally about six days, and that without the aid of steam or hoisting machinery. Mr. Maginnis thought "piece-work" in rivetted work should be abolished as expensive, and he instanced a case of an iron vessel which was found to be seriously defective after the first coasting voyage; the rivets were badly put in, and their heads not up to the plate.

Mr. Henry Turner contended there was little difference in the quality of rivetting done by piece-work as compared with that done by the day, as in the former the workman cuts out and makes good at his own expense, while in day-work it is done at his master's cost. He believed supervision was the great secret in producing good work, and that the fault in the case of the vessel alluded to by the last speaker was due more to bad design than workmanship. Mr. Alexander Ross spoke in confirmation of the cambering of bridges under a hot sun, and instanced one of the tubular bridges on the Chester and Holyhead Railway, where the rising of the bridge took place while the load increased. Mr. Birch said cross-piled plates did not produce cross tensile strength equal to that in the direction of rolling. Quoting a Cleveland manufacturer, he showed that in rectangular plates of ordinary sizes the strength in the direction of the rolling is to that crossways as 22 to 18. It was best not to specify piling, but only to require the necessary tests. Mr. Graham Smith, replying to the strictures, said the few failures in America are not a ground to condemn the whole system; factors of safety in America were greater rather than less than in England, being 10,000 per inch in tension and 8,000 in compression, and he fully appreciated the value of machine rivetting referred to by Mr. Petherick, and spoke in terms of praise of Tweddell's portable hydraulic rivetter.

STREET PAVEMENTS.*

SINCE the days of MacNeill, Telford, McAdam, Parnell, and others, volumes have been written upon this subject, yet we have in many localities pavements which are a disgrace to a community making any pretensions to scientific knowledge. This results either from a misunderstanding of all the conditions of the problem or an inability to fulfil them. The conditions, it is true, are intricate and variable, depending upon location, grades, nature of merchandise, vehicles, power, sub-soil, finances, &c., but in this monograph we propose to discuss briefly only the requirements of the surface covering, and to determine in the light of a long and varied experience what material will best fulfil all the conditions of a crowded thoroughfare. The requirements of the surface are that it shall be: (1) firm and elastic; (2) noiseless, clean, and dry; (3) smooth, yet rough; (4) permanent, yet easily removable; (5) light, yet heavy; (6) it should be durable, producing a minimum amount of wear and tear; (7) it must also be cheap and readily obtainable, and (8) non-combustible. The impossibility of selecting any one of the available materials, wood, stone, brick, cement, iron, or asphalt, which will fulfil all the above conditions, is apparent. A compromise must therefore be made, and one or more selected which will approximate most nearly to the requirements of the case.

It is interesting to observe the ingenuity displayed by advocates of a particular material in making it conform to every want, and in theory all the above materials have been found to answer equally well; but from a practical, rational, and disinterested point of view it is impossible that such should be the case; e.g.: *Vegetable Substances*, containing within themselves nitrogenous principles, elements of decay and putrefaction, should be rejected from sanitary considerations alone, but in addition to this, their combustibility, softness of fibre, permeability, and cost are serious obstacles, and the experience of numerous trials on both continents, under varied conditions, has proved them failures as to durability. We feel entirely justified, therefore, in omitting this material from the list of available substances until some more efficient means be successfully introduced of preserving the blocks, draining the foundation, and preventing dry rot. Iron has been used in various forms, but, being a manufactured article, it is more expensive than stone or wood, which are natural products. Hexagonal and other forms of blocks, covered with studs, and standing on legs which were driven into the foundation, have been discarded because of

the noise, expense, and insufficient foothold. Whenever tried in the form of blocks, iron has been found very objectionable, and its use is now restricted to tram and railroads.

Bitumen is a natural mineral product, belonging to the class of hydrocarbons, and may be found either solid, as in *asphaltum*, or liquid as in mineral tar. It is used chiefly as a matrix for harder materials. The best asphaltum is imported from Scyssel, in France, and Neufchâtel, Switzerland, but a tolerably good article is also obtained from the island of Trinidad. This substance melts at a comparatively low temperature, and is quite brittle when cold, so that it possesses properties which render it inappropriate for roads when subjected to great ranges of temperature and heavy traffic. When used, however, with sand and cement, it forms an excellent surface, so far as smoothness and durability are concerned.

The wooden pavement on Pennsylvania Avenue, Washington, has recently been replaced by another, part of which is composed of Neufchâtel bituminous limestone, one and three-quarter inches thick, laid on a foundation of eight inches of cement, and the remainder of "Grahamite" (pure asphalt from Ritchie County, Va.), two and a half inches thick on a similar foundation.

Brick, being merely clay indurated by burning, is too brittle for ordinary travel. We find ourselves, therefore, restricted to the use of stone or cement as fulfilling most nearly the requirements of a good road covering.

But *stone* occurs in a variety of forms, as in "cobbles," boulders, "spalls," or blocks, and in sizes which vary as the ratios of their three dimensions. Of the three first-mentioned forms, it is difficult to decide which is most injurious, yet these are the favourites with the community, because of their cheapness (?), and with the contractors because of the proportionately large margin of profit and necessity of frequent repairs. By this general and brief analysis, we are induced to believe that stone of a regular geometrical form is that which is most suitable for the purpose; cement being an artificial monolith, whose dimensions may be extended at pleasure, is included in this class. It is not intended to review in detail the whole question of the adaptability of the various materials to the object in view, as this has already been done in an exhaustive and able report of forty-one pages, made by eight eminent engineers, and published in 1843, but to review and emphasize the conclusions therein deduced. It was recommended to use a pavement of "dressed stone," laid diagonally upon a foundation of concrete, in those squares where the sewers and various supply pipes were completed, and to lay stone tramways on the steep gradients from Front-street down to Delaware Avenue. These are substantially the conclusions we are forced to adopt, even after the lapse of these thirty-four years, yet in all this time they seemed to have gained but little ground.

A tramway in connection with a "Belgian" block system would fulfil all the requirements in the best and most economical manner. Trams, 8 in. deep and 2 ft. wide, if well laid, would oppose the least possible resistance to the wheels of vehicles, and would be noiseless, whilst the blocks between would furnish the desired foothold, and the clicking of the horse's feet give sufficient warning of the approaching vehicle. This arrangement supposes the conditions of the horse and carriage to remain constant, and until lately it has been assumed that these elements of the problem were fixed, but rubber tires have been introduced and give great satisfaction. Still the roughness of the pavement required to furnish the necessary foothold has been found to cut and destroy them so rapidly as to render their general introduction improbable. If now we can substitute for the present shoe a material that will prove as durable and as secure, at the same cost, it will open the way to great reforms in all the elements of locomotion—viz., the pavement, the vehicle, and the power. Such an improvement has indeed been made and tested satisfactorily. It consists of a hollow shoe of the ordinary shape, open at the bottom, and having iron studs projecting vertically downwards through a $\frac{3}{4}$ in. tarred rope, which they hold in place, and

which serves as a packing. The shoe is put on without heating, and held in place by six nails. It has been used until worn down to a knife edge, and its life is quite as long as that of the ordinary iron shoe. The rope is not kicked out by use, but is, in fact, riveted firmer by the pounding down of the studs. The general introduction of such an improvement would undoubtedly lead to the substitution of concrete for the rumbling rubber pavements now in use. The chief objection, lack of sufficient foothold, having been overcome, minor difficulties need have but little weight, as that portion of the surface overlying sewers, &c., might be divided into blocks, which could be readily removed and replaced. The necessity of breaking the surface for pipes could easily be avoided by laying them hereafter under the sidewalks or in rear of the dwellings, in streets of the second class.

There is a street in Philadelphia (a short one, to be sure), upon which there is no railway, and whenever a waggon or cart passes at a trot it shakes all of the buildings, which are said to be substantial. What must be the waste of energy that will set in vibration the houses on both sides of a street whenever a vehicle passes? Yet the injury is not limited to the vehicle, the edifice, nor the road covering, all of which are badly shaken up, but extends in a greater degree to the animal life affected by it: the horse, and the individuals in the house or conveyance. It is a constant strain upon the nervous system of women, invalids, and children, whose sleep is disturbed and restless. The racket is especially noticeable by visitors from rural districts, who are unaccustomed to such a continual jarring. This enormous waste of energy can, and should, be avoided by recourse to proper engineering expedients, and no one will deny that a uniformly smooth, even, and continuous surface, such as that furnished by a good cement pavement, with only joints enough to permit of expansion, would fulfil in the most perfect manner all the requirements for the horse, carriage, passenger, and resident, could be kept perfectly clean, and when once laid, would require the minimum amount of expense for repairs and police.

Before closing, there is another point which is worthy the consideration of the enterprising and progressive citizen, and that is the large amount of space wasted by front steps. In many streets at least half the footwalks are interrupted by such projections, forming useless dead spaces between them, which serve to collect the snows of winter, to be piled up in the street, forming impassable obstructions for a considerable length of time. The steps themselves, exposed as they are, become dangerous from ice, and are not an architectural necessity nor ornament. Every consideration of humanity would suggest their being withdrawn, and, when necessary, occupying the place of the vestibule, leaving an open recess or niche in the place of the outer door. Thus the visitor or resident would be sheltered from sun, wind, rain, or snow, whilst waiting the answer to his summons; the steps would not be dangerous by being coated with sleet; the suggestion of hospitality would be extended by the apparently open door, which effect would be heightened by an outside lamp at night, and the full breadth of the sidewalk left available for a promenade, with rows of trees, if desired. The plan is not a new one, but is in use in many cities of this country and the Continent.

At Derby Borough Police-court, on Saturday, Mr. Henry Sheffield, architect, was fined £3 and costs for assaulting a police constable in the execution of his duty.

In an official report as county surveyor for Cork, Mr. S. A. Kirby, M.A., after reminding the grand jury in quarter sessions of the dangerous state of the timber bridges over the river Bandon, draws attention to the practice which, he states, is becoming every year more common with contractors for county bridges in Ireland, of not applying for a renewal of their contracts—a device which tends to defeat competition.

Monachlogdu parish church, at the base of Treccelly Top, Pembrokeshire, which till recently was so dilapidated that service could not be held between its walls, has just been reopened after partial restoration. Messrs. Waters and Thomas, of Saundersfoot, were the contractors.

OUR LITHOGRAPHIC ILLUSTRATIONS.

HUDDERSFIELD MARKET HALL—FIRST PREMIATED DESIGN.

THE design illustrated herewith to-day is by Mr. Charles Fowler, of London, and was selected for the first premium by Mr. Street, who was called in by the Market Committee to advise as to the respective merits of the designs submitted in the recent competition for a new Market Hall at Huddersfield. There were 32 sets, comprising 272 separate drawings; the instructions required that each design should be illustrated by at least two exterior and one interior perspective. The site of the proposed building is a parallelogram, 270ft. by 101ft., bounded by streets on all sides; and it was provided by the instructions that the principal entrances should be at the ends. The side streets are narrow, so the elevations were to be kept of moderate height. There is a difference of level of about 7ft. between the highest and lowest point of the site, so that the keynote of the design was the question of the level of the Market Hall; steps, however objectionable, were unavoidable. The instructions provided that the shops along the sides should, as far as possible, be entered from the streets. The street on the lower side is level throughout, and a height of 10ft. for the shops there fixed the level of the Market Hall, so that a row of shops above should be entered direct from the hall—a gallery being considered objectionable by the author. The street on the upper side is from 3ft. to 7ft. higher; here, therefore, only one row of shops is placed—as shown in the view. In the centre of each of the long sides of the hall there is an entrance for goods, which would be unloaded from the carts direct into the hall, avoiding the difficulty of the steps. At the same points there are minor entrances for passengers. By this arrangement of the floor levels the basement, extending under the whole of the hall, would be entered on a level from the lower street. At each end of the hall there is a block of buildings—the upper stories being arranged for offices, with shops below. Owing to the great difference of level at the end, shown in the view, there is a mezzanine over the shops in the lower level. The recessed terraces were arranged to avoid the unsightliness of stepping up the shops to follow the level of the ground. This also afforded the opportunity of a more effective arrangement of the elevation. The amount of the outlay being very limited, the character of the elevation was necessarily simple. The instructions provided that the design was to include a tower, which, however, might not be carried out. This circumstance suggested the form of the tower adopted in this design, which could more easily be omitted without seriously affecting the design than if carried up from the ground and the top cut off. We are informed that the committee are not satisfied with the result of the competition,

and do not intend to carry out any of the designs; but they very properly acted on Mr. Street's advice by awarding the premium according to his report.

TOWER AND SPIRE—EAST TEIGNMOUTH CHURCH.

THE drawing reproduced among our illustrations to-day is from the only exhibit this year at the Royal Academy, by the late Fred. C. Deshon, whose death we have only so recently recorded.* Three years since Mr. Deshon exhibited on the same walls an interior and exterior view of his designs for East Teignmouth Church, which is dedicated to St. Michael. These drawings illustrated a simple but clever and boldly-treated double-aisled church, with nave 80ft. long and 28ft. wide, having a chancel 33ft. long and 18ft. wide. The passage ways crossed in the centre bay of the nave arcade, and a south porch in a similarly central position was provided, of a characteristic design, in timber. An unusually conspicuous bell turret was shown at the west gable, having a projecting gallery of wood covered with a pent roof, and supported on massive stone corbels. This gallery was approached by a stepped coping to the west gable on the south side, though no means of reaching these steps, excepting from an ordinary ladder, was shown. This curious feature was, however, subsequently set on one side in favour of a western tower and spire. Mr. Deshon prepared two designs for this—that which we illustrate is, we believe, the one selected, the other being perhaps more singular than its author would have cared to acknowledge as his own if executed. The published design, however, is no doubt one of the best, at any rate, shown on the Royal Academy walls this year, and as it is the last of the author's designs which probably we shall ever illustrate, it is certainly the best. The chancel of the church has been already built, and the works will proceed as funds permit. The church is taking the place of an unsightly and inconvenient building erected as a church in 1823. Accommodation is provided for 645 persons, and the estimated cost, exclusive of tower, was £5,600.

CHILDREN'S HOSPITAL, CARDIFF.

ANOTHER Royal Academy drawing, which we reproduce to-day, is that by Mr. J. D. Sedding, for a new sick children's hospital at Cardiff, of which we also give a copy of the ground plan. The materials are red brick with stone very sparingly used; the domes and gables are enriched with carved brickwork, and a striking design in rather Queen Anne style is obtained, though the drawing hardly does it simple justice.

SLOUGH PARISH CHURCH.

OUR view, which we publish to-day, of the new Parish Church at Slough, now building, shows the Memorial Steeple which is proposed in memory of the two Herschels, who were natives of Slough. The present church was built in the Norman style, modified to suit stock brickwork, some forty years since. Mr. J. O. Scott says:—"It has nothing to recommend it outside, and everything to censure it within. Whether it is a building which could enlist the sympathies of the Anti-Restoration Society or not it is impossible to say; but it is certainly historical, as marking one of the dearest periods of Church life in England." It is gradually to be replaced by a new building. Transepts and a spacious chancel, with organ-chamber and vestries, are now being added, and it is hoped that before long it may be possible to rebuild the nave. That portion of the church which is illustrated herewith from the architect's Royal Academy drawing (this year) will probably be undertaken last. The church, when completed, will consist of nave, about 105ft. long and 25ft. wide, having aisles on either side, 14ft. wide, and an arcade of four arches, exclusive of those which connect the transepts, which are about 27ft. deep, with the nave. The choir has an aisle on both sides, the organ-chamber being to the north, and the vestries to the south of these. The sacristy extends eastward some 20ft., making the chancel in total length nearly

40ft., its width being 22ft. The transepts both have an entrance porch in their west sides; that to the south transept being shown in our view. A south porch is as usual provided; while an entrance is effected to the north through the tower. The font is placed immediately under the west window. The east ends of the nave aisles are divided from the transepts by an interesting and rather unusual arrangement, which may be described as a short arcade, in each case of two arches. The pulpit is placed on the south respond of the chancel arch. The portion of the church now in progress will cost between £7,000 and £8,000. Mr. Lassidge, of Uxbridge, is the contractor, and Mr. Webster is the clerk of the works. The materials are red brick of two qualities, with an admixture of stone and flint. Mr. John Oldrid Scott, of Spring-gardens, is the architect.

ST. SAVIOUR'S CHURCH, WALTHAMSTOW.

WE publish an interior view from the architect's drawing, now at the Royal Academy, of the church of St. Saviour's, recently erected at Walthamstow, from designs by Mr. Francis T. Dollman, architect, of the Adelphi.

"BUILDING NEWS" DESIGNING CLUB—TWO-STALL STABLE DESIGNS.

TO-DAY we publish the four designs which we have selected as being first in merit from those sent in for a small two-stall stable with loose-box and hayloft over. Each design possesses commendable points, though neither is to be accounted a model, and we refer our readers to our remarks when we made the selection, page 20, BUILDING NEWS, July 6th. "B." in a circle we place first, "Another for Hector," second, "B.N.," third, and "Sperabo," fourth.

CAMBRIDGE-GATE, REGENT'S PARK.

A TERRACE of houses now occupies the site of the old Colosseum in the Regent's Park; decaying picturesque architecture has given place to substantial mansions worthy of the beautiful site, erected in no niggard spirit by Mr. Stanley G. Bird, from the skilful designs of Messrs. Archer and Green. The houses are set back from the main road, and fronted by an ornamental enclosure or garden. There are two entrances to the terrace, and at either two pedestals of stone, and upon each have recently been set up groups of figures which are worthy of more than a passing glance. Each group consists of three female figures, triangular on the plan, if it may be so termed, and placed back to back, forming a support for the lamps to be hereafter fixed. The groups are each 6ft. in height, in one block of terra-cotta, the largest, it is stated, which has yet been executed. The colour is a rich buff, and the groups, with their respective attributes, represent the four seasons of the year.

As works of art of a very high order, these figures are remarkable, and their presence denotes a liberality not often met with in a speculative undertaking. The arrangement of the figures gives a variety of profile as pleasing as it is novel, and the voluptuousness of the modelling and the graceful ease of the pose leave little to wish for. There is life in the winning pleasantness of each fair feature; there is movement in the attractiveness of each lithe limb; and there is just enough, and not too much, mechanical finish in the whole. They are masterly sketches, exhibiting all the power which only real aptitude and genius can strike off and leave without that laboured expenditure of time characteristic of the mediocrity of most of our modern sculpture. The author of these fine productions is a Frenchman, M. Kremer, of No. 3, Augustus-square, Regent's Park, an artist already known to many of our eminent architects, and his work has been exceedingly well carried out at the Lightmoor Terra-cotta Works of the Coalbrook-dale Ironworks Company, Shropshire.

WILLIAM WOODWARD.

MESSRS. S. Taylor and Co., zinc and galvanised ironworkers, of Snow-hill, Birmingham, have recently erected new and extensive premises at 145, 146, and 147, Lionel-street, where all communications should in future be addressed.

THE LATE DR. JOHN STUART.

THE well-known Scottish archaeologist, Dr. John Stuart, died at Ambleside on the evening of Thursday week. He was born at Forgue, in Aberdeenshire, in 1813, and was educated, and for many years practised, as an advocate, ultimately being appointed Principal Keeper of the Register of Deeds at Edinburgh. In 1839, Dr. Stuart, acting in concert with Mr. Joseph Robertson, long superintendent of searches in the literary and antiquarian department of the Register House, set on foot the "Spalding Club," having for its object the collection and printing of ancient historical manuscripts connected with the northern counties of Scotland. Of this society he acted as secretary down to the close of its operations in 1870; while of the thirty-eight volumes which it from time to time gave to the world, no less than fourteen were produced under his editorship. Prominent among these contributions to archaeology were the two folios on the "Sculptured Stones of Scotland," published in 1856 and 1867, through which, perhaps, Dr. Stuart's name has become more widely known than by any other of his numerous publications. While many of his papers bespoke the special bent of his mind towards what may be called documentary archaeology—a bent which led him to seek holiday relaxation in rummaging through the charter chests of old country houses—he from time to time dealt with more popular branches of the subject, such as early monuments and lake dwellings. The latter department of inquiry may be said to have been bequeathed to him by his friend, Mr. Joseph Robertson, who was, perhaps, the first to investigate Scotch crannogs, and who, at the time of his death, had a paper on the subject in preparation for the press. Taking up the incomplete work with characteristic industry, Dr. Stuart produced for the "Society's Transactions" what is regarded as the most complete résumé of the subject anywhere to be met with.

His researches among old family records led him to make one notable discovery. This was the original dispensation for the marriage of Bothwell with Lady Jane Gordon, which was discovered among the records of Dunrobin Castle. The paper, which was believed to have mysteriously disappeared at the time, had been the subject of much speculation; and its recovery had an important bearing on the legality of Bothwell's subsequent marriage with Queen Mary, and it afforded Dr. Stuart the opportunity of discussing, as he did in the volume entitled "A Lost Chapter in the History of Mary Queen of Scots," the law and practice of Scotland relative to marriage dispensations in Roman Catholic times.

In 1866, the degree of LL.D. was conferred on Dr. Stuart by the University of Aberdeen. By the Archaeological Institute of Great Britain and Ireland he was elected an hon. member; and a similar compliment was paid by the Society of Antiquaries of Zurich, and the *Assemblea di Storia Patria* in Palermo.

CONCRETE, AND ITS USE IN BUILDING.*

MR. THOMAS POTTER, one of the joint authors of the "Design for a Concrete Villa," to which we awarded the first prize in one of our competitions, and which was illustrated in the *BUILDING NEWS* of March 17, 1876, has published an exceedingly useful handbook on the use of a material which, as our readers know, we have always predicted would come more largely into use year by year. Mr. Potter is himself the inventor of an apparatus for building in concrete, which is manufactured by Messrs. F. W. Reynolds and Co., but it is only fair to say that few people would guess this from a perusal of his book, so fairly has he dealt with other appliances and means of building. The illustration of Messrs. Potter and Mallinson's premiated design is reproduced as a frontispiece to the work, and will be found a safe and suggestive model—with one or two slight drawbacks connected with the plan which we pointed out at the time of its publication—by any one desirous of using concrete.

In his introduction the author traces the history, and points out the advantage, of

concrete building, and then, in the first chapter, proceeds to review the different systems of construction which have at various times been duly described and commented on in this journal. He then goes on to treat on the method of preparing the materials, and gives some valuable information respecting the natures and capabilities of the different matrices. The more purely original part of the book, and that which is due to Mr. Potter's own experience, will be found in the last seven chapters, wherein he deals with the alleged disadvantage attending the use of concrete, its cost, its external treatment, and the importance of proper specifications for buildings in which it is to be used. These three points are, after all, those on which its more thorough recognition to a great extent depends. There is no doubt that the public were to some extent led astray on the first by enthusiastic patentees, and Mr. Potter frankly admits that this question is such a conditional one that no definite comparison with other materials can be made. The second has always been the stumbling block in the way of architects. The difficulty of using anything but flat surface ornament has prejudiced many against concrete who would otherwise have gladly used it. In the design which is reproduced from our pages, a method was shown of using timber veneers which gives the appearance of a half-timbered building without losing the advantage of a concrete monolithic wall. It is true a very conscientious architect might object to this as a sham, though, as Mr. Potter points out, it need not be such, and certainly is not so flagrant an attempt to deceive as the use of Baltic fir timbers, painted and grained to imitate oak, which is common in half-timber buildings. We agree, however, with the author that the method of externally finishing concrete buildings is still in arrear of the success attained in dealing with it structurally, and that improvements are still open to discoverers. On the last point mentioned above, Mr. Potter is precise and to the point, and this single chapter to any one about to build is worth several times the price of the whole book, which, taken altogether, is the best general treatise on its subject we have yet met with.

KENSINGTON VESTRY HALL COMPETITION.

AT last the award of the Vestry of St. Mary Abbots, Kensington, has been arrived at in the competition of designs for their new Vestry Hall, which is to be built in High-street, on a plot of land adjoining the existing building now used for vestry purposes. At a meeting of the vestry, held on Wednesday evening last, the following designs were selected in accordance with the recommendations of the committee elected to report on the subject:—1. "Experientia," Robert Walker, F.R.I.B.A., of 10A, Kings Arm's-yard, Moorgate-street, London, E.C.; 2. "Expert," John J. Thomson and Frederick Davis, architects, Charing-cross; 3. "Experience," E. C. Robins, F.R.I.B.A., Adelphi, an extra premium of £31 10s. being awarded to the design bearing the motto "Cavendo Tutus," by Mr. Fredk. Mew, of Doughty-street, W.C. Considerable doubt, however, seems to exist in the minds of the vestry as to whether it is possible to carry out either of the designs which they have selected for the stipulated sum of £18,000 named in the particulars issued to architects, so that it has been determined to call upon the authors of the chosen designs to show clearly that the building can be erected in accordance with their respective designs within a reasonable limit of the amount named. This much for the award of the vestry; we now turn to the report of the professional referee, Mr. John Whichcord, F.S.A., who was engaged to assist the committee and furnish a detailed report on some sixteen or seventeen designs already selected by the committee from the whole series of designs. Although we have not as yet been favoured with a copy of Mr. Whichcord's report, we have seen it (a copy is on view at the present Vestry Hall), and, as may be supposed, it is a very carefully-detailed statement characteristic of its author, who, at the outset,

boldly states that however much the merits of architectural effect and artistic treatment may demand consideration, he has been obliged, both by the value of the site and the conditions of competition, to consider plan as of exceptional importance, and the following are the designs which, with all things considered, he recommends for selection. We add the authors' names, in all cases where they are given, from our own knowledge:—"Cavendo Tutus," 1, estimated cost, £19,040, Richard Mew; "Old Kensington," 2, estimated cost, £17,900,* John O. Scott; "Kensington," 3, estimated cost, £19,900, John J. Stevenson; "Experience," 4, estimated cost, £20,800, E. C. Robins; "Serius," 5; "Spero," 6; "Nos" in triangle, 7; "Expert," 8—John J. Thompson, F. Davis. It will thus be seen that in every instance the referee's recommendation has been set on one side, while for the first premium a design entirely outside of his list has been chosen, the second premium being awarded to the design placed last by Mr. Whichcord. It is also to be noted that the design "Alpha," 37, which was more than once reported as being the selected design, is not accounted in either list, although named in the series first selected by the committee for award by the referee, who reports this design to be chiefly faulty with regard to its want of consideration for ancient lights—a point of the utmost import in determining an award in the present instance. Indeed, a model had to be made at last, showing the several and varied claims in this respect. We are not certain whether Mr. Whichcord's report will be published or not.

CHINESE SUSPENSION BRIDGES.

THE most remarkable evidence of the mechanical science and skill of the Chinese is to be found in their suspended bridges, the invention of which is assigned to the Han dynasty, which flourished 1,600 years ago. According to the concurrent testimony of all their historical and geographical writers, Shang-leang, the commander-in-chief of the army under Kaou-tsoo, the first of the Hans, according to Thornton's "History of China," undertook and completed the formation of roads through the mountainous province of Shen-se, to the west of the capital. Hitherto its lofty hills and deep valleys had rendered communication difficult and circuitous. With a body of 100,000 labourers he cut passages over the mountains, throwing the removed soil into the valleys, and where this was not sufficient to raise the road to the required height, he constructed bridges, which rested on pillars or abutments. In other places he conceived and accomplished the daring project of suspending a bridge from one mountain to another across a deep chasm. These bridges, which are called by the Chinese writers, very appropriately, "flying bridges," and represented to be numerous at the present day, are sometimes so high that they cannot be traversed without alarm. One still existing in Shen-se stretches 400ft. from mountain to mountain, over a chasm of 500ft. Most of these flying bridges are so wide that four horsemen can ride on them abreast, and balustrades are placed on each side to protect travellers. It is by no means improbable (as M. Pauthier suggests), that as the missionaries in China made known the fact, more than a century and a half ago, that the Chinese had suspension bridges, and that many of them were of iron, the hint may have been taken from thence for similar constructions by European engineers.

THE METROPOLITAN STREETS IMPROVEMENT BILL.

IN a letter to the *Times*, Mr. Samuel Webb exposes an ingenious attempt on the part of the Marquis of Salisbury to increase the value of his own property at the expense of the public. The Marquis has prevailed on a committee of the House of Lords to insert a clause in the Metropolitan Streets Improvement Bill which has made it necessary for the Metropolitan Board of Works, in the interest

* Concrete; Its Use in Building and the Construction of Concrete Walls, Floors, &c. By THOMAS POTTER. London: E. and F. N. Spon.

* This is the only design submitted at an estimated cost under the stipulated sum—£18,000.

of the public, to abandon the new street from Tottenham-court-road to Charing-cross—a street properly described in the report as one of the most important proposed in the bill. The effect of the clause is stated to be that, after the Board of Works has bought up all the leasehold and trade interests on the marquis's freehold property, through which the street runs, he is to sell to the Board the strip of freehold required for the street, and not the freehold of the entire portions of land acquired by the board. The result will be that the marquis, having obtained an outside price, plus 10 per cent., for his land, will retain in his own hands all the frontages, subject to the Board's interest in the leases, which on the marquis's estate have generally but short terms to run. The houses having been destroyed, the Board will, nevertheless, continue liable for the rents, and must either pay those rents out of the rates or sell the leasehold interest to the marquis at practically his own price. In case the first burden is thrown on the ratepayers the street will be unbuilt on, and an eyesore to the metropolis until the leases expire. In ordinary circumstances the frontages are let or sold by the Board, and so recoup part of the cost of the street. The scheme is ingenious, but it is an attempt to burden the ratepayers which the Metropolitan Board of Works has very properly resisted before the Lords, and has more properly, in the interest of the public, determined not to accept. The marquis by his conduct is obstructing a great public improvement, reported on as necessary by a Parliamentary committee many years ago.

BUILDERS' BENEVOLENT INSTITUTION.

THE thirtieth annual general meeting of this institution was held yesterday (Thursday) at Willis's Rooms, St. James's, the Treasurer (Mr. George Plucknett, of the firm of Cubitt and Co.) in the chair. The annual report congratulated the subscribers and donors upon the satisfactory position of the institution. Through the energetic appeal made by the President (Mr. Charles B. Waller), on the occasion of the annual dinner in November last, the donations then obtained were very liberal, and, as the Court of Chancery had sanctioned the transfer of the "Building Fund" to the "General Relief Fund," the amount now invested in the Three per Cent. Consols was £20,292 13s. 7d. Such being the case, the committee felt they could safely recommend that all future donations should be expended instead of being funded, and that the amount of the pensions should be increased. As to legacies, it was proposed to fund them as heretofore. The report also recommended that the widow of a pensioner should receive a woman's pension on the death of her husband, in lieu of, as at present, receiving the half pension until elected a full pensioner upon the funds of the charity. These alterations will be very advantageous to the recipients, and it is hoped that the donors and subscribers will do their utmost to enable the committee to carry them out. The committee report with much satisfaction that Mrs. Lerner (lately a pensioner) has been enabled, from altered circumstances, to withdraw from receiving her pension, and that she has, with feelings of gratitude, presented the institution with a donation of five guineas. Five pensioners were elected during the past year, and six have died. The thanks of the committee are due to the secretary, Mr. F. W. Keeble, for the ball, and for the interest he took in making it a success by which the sum of £54 3s. was realised. The annual dinner will take place on Nov. 8. The report having been unanimously adopted, the meeting sanctioned, *nem. con.*, the alteration and revision of the rules of the institution. By Rule 1, as amended, the men's pensions are increased from £24 to £30 per annum, and the women's pensions from £20 to £24. Votes of thanks to the patrons, vice-presidents, committee, trustees, treasurer, and auditors, and to the president for the past year, were duly accorded, and the officers and committee for the ensuing year were elected. On the motion of the chairman, Mr. William Higgs was unanimously elected president of the Institution for the ensuing year.

ARCHITECTURAL SCIENCE CLASS.

ELEMENTARY REPLIES.

QUESTION 55.—*Describe different materials used by painter. Describe ingredients of colour.*—The materials used by painters are paints, oils, driers, stains, varnishes, &c. Colours or paints may be divided into five classes, according to their principal ingredients. Lead paints, most commonly used, have white lead or carbonate of lead as a basis. This material is ground up in oil in a stiff paste. Linseed oil, with litharge or other driers, and sometimes turpentine, are added to it to form the paint ready for use. The required tint is obtained by adding to this the proper colouring pigment. The exact proportions of ingredients is regulated by the nature of the work, climate, &c. Red lead enters into the composition of the priming coat because it is a good "drier," and sets "hard." Linseed oil is used as a medium for applying the paint; it fills up the wood pores, and acts as a preservative. Turpentine makes the paint easier to work, and more liquid, but it plays no part in the preservation of the wood, as the greater part evaporates. Driers are mediums to cause the contained oil to dry and set quickly. Various materials are used, as litharge, sugar of lead, &c. Zinc paints have zinc oxide as a basis. Silicate paints are manufactured from almost pure silica, which is not acted upon by any metal or acid—in fact, is almost indestructible. This kind possesses the advantages of great durability, has no galvanic action when applied to iron, as in the case of lead paint, and does not tarnish by the action of gases. Colours are made same as the lead paints, and are mixed in the same way. Oxide of iron paint acts as a good preservative for ironwork. Bituminous paints are used for a similar purpose, and for rough carpentry. Stains are mixtures used to darken wood to the colour of the imitated wood. Varnishes are of various kinds—copal, &c.—and are used to preserve the paint, and give a gloss to the finishing coat.—T. N.

QUESTION 56.—*Describe the process of common painting wood and ironwork.*—Woodwork is prepared for painting by brushing over all resinous knots with a thin coating of knotting (a compound of shellac dissolved in naphtha) or gold size, to confine the resin, and prevent it running under the paint. The priming is then laid on, any plain colour well worked into the pores of the wood, with and across the grain; when this is dry, the stopping is done. All nail and brad-holes, &c., must be well filled up with putty, and lightly rubbed off with glass-paper. The second and following coats are applied with more care, brushed with the grain, and the work covered equally everywhere, showing no tool-marks or running edges. If the last coat is to be light, the second and third should be similar in colour, and if it is to be finished dark, dark colour must be used for the previous coat. Ironwork should be cleaned free of all rust, oil, or grease before painting. A good first coat is colour made up with red lead; the other coats may be similar to that used for wood. Iron being almost non-absorbent, three coats are sufficient for new work, unless in very exposed situations, and for the same reason, care must be taken, especially in ornamental work, not to fill up the fine lines of leafwork, &c., by using too much paint, as the character of the work would thereby be injured. It is not so much a thick coat as a thorough one that is the best protection.—AUBERY.

QUESTION 57.—*In colouring walls what precautions should be used?*—The walls should be thoroughly dry. In colouring walls the coats should be carefully laid on and smoothly, each coat being rubbed slightly with sand-paper before applying the next. The "flattening" or finishing coat should be made a few shades lighter than the pattern, as it darkens in drying. Japanner's gold size, if used, should be applied quickly, as the turps evaporates quickly, leaving an indelible glossy surface. A certain time should be allowed between the coats, the drying of the same depending upon the quantity of driers used, the weather, and temperature of the apartment. To expedite the work, new walls are generally "distempered" when not dry enough to receive the permanent decorations. Distempering is a kind of painting with colour prepared with size or some other glutinous substance. In distempering, the walls must be dry and free from damp; if not, at the completion will be shown all the defects. Two or three coats should be applied, in order to obtain an even colour.—A. L. B.

ADVANCED REPLIES.

QUESTION 55.—*Explain the theory of colouring.*—The accepted theory is that there are certain colours that cannot be produced by any combination of other colours. They are termed primaries, because all other colours can be obtained by mixing them in certain proportions. The primary colours are red, blue, and yellow. Some authorities substitute green for yellow. Secondary colours are derived from mixtures of the primary colours in pairs—as violet from red and blue, orange from red and yellow, and green from yellow and blue. Tertiary colours are produced from secondaries—as citrine from orange and green, &c. White and black are usually considered neutrals. To secure "harmony of colours" they must be equalised to the varying proportions shown in the solar spectrum—the three primaries being used either in their purity or com-

pounded. The eye being constructed to see white light, when looking on a coloured surface, it is best pleased by a contrast. Contrasting colours to harmonise should be mutual complementaries of each other—making up the full complement of colours contained in the solar rays. The complement of any primary—say, red—will be the secondary compounded from the other two primaries—as green from blue and yellow—red will thus harmonise with green, blue with orange, and yellow with violet. The best proportion for mixing primaries, so as to harmonise, is: red, 5; blue, 8; and yellow, 3. The latter is the most vivid, and should obtain a prominent position. Blue is least vivid and retiring, and should be kept in the background—red to be used as an intermediate colour.—S. M. E.

QUESTION 56.—*Describe the proper mode of painting wall surfaces.*—To paint wall surfaces properly often five coats are necessary; but if the plaster be not very absorbent four will be sufficient. If the work is required without gloss the last coat is mixed with turpentine only, which is called flattening; if the work be not flatted the finishing coat is two of turpentine to one of oil. For the priming coat boiled oil should be used, then the three coats of white lead and oil, or more if required; generally the first coats should be some shades darker than the finishing coat. The proper drier to be used for walls is sugar of lead, and in painting wall surfaces great care should be used in selecting the very best quality of oils and white lead—the older the oil the better.—ATTNEAVE.

QUESTION 57.—*What is the best paint for ironwork?*—The best paint for ironwork is either the oxide of iron paint, known as the Torbay paint, or the silicate oxide paint, both consisting of oxide of iron and silicious matter, to which any colour may be added and applied in the usual way. They can be applied even after the surface has commenced to rust, as from their nature they amalgamate freely with the rust, forming an impervious coating adhering well to the surface, and yet sufficiently elastic to prevent cracking when the iron expands or contracts under variations of temperature. Bituminous or tar mixtures, thinned with linseed oil, are well adapted for ironwork, especially when they can be applied hot, or to the heated surface of the metal, so as to insure a firm adhesion by entering the pores. A mixture of silicate oxide with tar also forms a good durable coating on iron. When ironwork is to be painted with ordinary lead paint red lead should be used. The adhesion of such a coating on ironwork can seldom be depended on in consequence of the non-porous surface. This is further prevented by the galvanic action that sets in between the iron and lead. Galvanising, or coating the surface with a preparation of zinc, is also frequently resorted to as a preservative. With all such coatings the surface must be perfectly clean and free from rust. It is advisable, so as to prevent rusting, that all ironwork should be coated with some preservative soon after it leaves the mould, forge, or mill.—S. M. E.

CHIPS.

A new drill-hall has been erected at Gateshead for the Volunteer Engineers. Messrs. T. and R. Lamb, of Gateshead, were the contractors.

A family mansoleum has been erected in the grounds of Manston House, near Wimborne. The architect is Mr. Soppitt, of Shaftesbury, and Mr. Lionel Parsons, of Stalbridge, the builder. In general design the building is described as "eclectic, being a free rendering of the Doric style, with an infusion of Byzantine feeling." The construction is massive, the solid walls of the vault below being 3ft., and those of the superstructure 2ft. thick, composed, as are also the ceiling and floor of the vault and the principal dome, of cement concrete.

The foundation stone of a new Conservative Club-house was laid at Tranmere on Saturday. The building will be of brick, with Stourton stone dressings. Messrs. Hoult and Wise, of Liverpool, are the architects, and Mr. Richard Bell, of Tranmere, is the contractor.

New public baths at Northampton have just been completed by Messrs. P. and R. Phipps. Mr. Hull is the architect.

New cattle markets are about to be erected at Hull from designs by the borough engineer.

A new Board School at Leith will be opened in a few weeks. The building, which has cost £7,000, will accommodate nearly 700 children. Mr. James Simpson, of Leith, is the architect.

The memorial stones of a new Wesleyan chapel, at Langton-on-Swale, were laid yesterday week. Mr. Alfred J. Martin, of Darlington, is the architect.

St. Agnes, Burmahonts, the fourth of the temporary wooden churches now being erected by the Leeds Church Extension Board, was opened on Mouday.

The tenth half annual meeting of the Cork Improved Dwellings Company was held in that city on the 19th inst., when a dividend at the rate of 6 per cent. was declared upon the profits of the half year. The report showed that an addition of £104 had also been made to the reserve fund. The chairman announced that the directors are in search of a site for the erection of additional houses, and that they propose to build some on the northern side of the city.

Building Intelligence.

BELFAST.—The new Roman Catholic Church of St. Patrick, Belfast, will be opened next month. The building is of a Romanesque type. The internal length is 126ft., and the extreme width across the transepts is 102ft. On the ground-floor the area contained westward of the chancel arch—i.e., excluding chancel and sacristies—amounts to 8,500 superficial feet. The church is terminated by a semicircular apse as high as the nave, and separated from it by an arch the height of which is exactly 50ft. from the floor underneath. The apse has round its circle seven single light windows, filled with stained glass by Messrs. Early and Powell. At either side of the apse is a side chapel, lighted by a circular cusped window in each, and these have also been filled with painted glass. The design is by Mr. Timothy Hevey, F.R.I.A.I., with whom has been associated in the work throughout Mr. Mortimer H. Thomson.

BILLINGSGATE.—The new fish market at Billingsgate was opened last week. The old market was erected by Mr. J. B. Bunning, at that time the City architect, but has long been altogether inadequate to the requirements of the trade. The total area of the new market on the level of Thames-street, is about 39,000ft. superficial as against 20,000ft. of the former market. From the peculiarity and nature of the site being the bed of an estuary or creek of the river, it was necessary to excavate the soil—a mingled mass of piling, river mud, cesspools, and refuse of all kinds—to a depth ranging from 30ft. to 40ft. below the present level of Thames-street. Opportunity has been taken to construct a lofty, airy, and fully-lighted basement about 24ft. high, which has been in use as a shell and general fish market, and is applicable for other market purposes should overcrowding on the level of Thames-street render it necessary or desirable. Groined, vaulted, and domed on lofty piers, and open for light and ventilation, it forms no unimportant feature in the work. The general fish market on the level of Thames-street is a broad, level space, about three-fourths of the area of the entire site, and devoted entirely to salesmen's stands, the remainder of the area of the site being used as shops with warehouses over, and let to salmon and other salesmen requiring this accommodation. These shops or warehouses (14 in number) situated on either side of the market, and extending from the river to Thames-street, have their frontages towards, and are entered from the great market area. The accommodation of this floor also includes two large taverns, situated at the south-east and south-west extremities of the river front. The broad area of the market is covered with roofs on the louver glass principle, carried on lattice girders of 60ft. span, affording ample light and ventilation to the general market. The height from floor to roof will be 31ft. 6in. at the plate, and 43ft. at the ridge. The gallery, some 30ft. in width, running from north to south, above the general market (from which it is approached by the staircase halls, which also serve for the access to the basement), has an area of some 4,000ft., and is used as a market for the sale of dried fish—a considerable traffic in which is carried on at this market. The heavy goods, barrels, &c., for the upper and lower markets of this building, will be conveyed from the ground floor by means of hydraulic lifts—one of which is fitted up near Thames-street—to take the land traffic, and another is proposed to be placed next the river to accommodate goods brought by water. This lift is the work of Messrs. Bunnett and Co., of Queen-street. The design of the building is Italian in character, and the materials used in its construction are Portland stone with polished grey granite plinths and wall linings, and the intervals between the archivolts and windows are filled in with yellow brick facings. The front next Thames-street consists of an arcade, terminating in its eastern and western extremities with pavilion buildings, and a pedimental central feature marking the entrance to the shell-fish and dried-fish markets, surmounted by a figure of

Britannia. To the river front is a similar continuous arcade, flanked by Italian pavilion buildings.

BRISTOL.—The memorial stone of a new Congregational Sunday School was laid at Bristol, on Tuesday. The new buildings are designed in the Classic style, to correspond with the chapel, the whole of the exterior being of freestone from the Westwood quarries, and the interior walls of brick. The main school-room will be a total length of 67ft., a width of 24ft. 9in., and a height of 21ft. The entire outlay on the schools, and some repairs which are to be effected on the chapel, will be £2,000. The plans are by Messrs. J. W. Trew and Sons, architects, and the builders are Messrs. Stevens and Gardiner.

CORK.—The new orphanage of St. Vincent de Paul, Cork, was opened last week. The style is a free treatment of the 13th century, with large windows. The ground-floor contains school-rooms, refectories, parlours, and offices, all united by a corridor or cloister 7ft. 6in. wide by a total length of 146ft., terminated at either extremity by staircases. On the upper floor are the cells of the nuns, and the other wing is devoted to the purposes of infirmaries, lavatories, &c. In the centre of this floor is the chapel, the reredos of the high altar of which is enriched with paintings by Mr. N. H. J. Westlake, of London. The top-most story is devoted to dormitories for 40 children, and the requisite number of nuns to superintend them. The edifice has been built of native red sandstone, relieved by bands and dressings of limestone. The designs are by Mr. George Goldie, of London; and Mr. Barry M'Mullen, of Cork, efficiently carried out the work.

DEVON.—The old chapel of South Zeal, in South Tawton parish, has recently been renovated and made suitable for worship. An edifice of the Tudor times, of rather rude granite work, much neglected and dilapidated, it had of late years been used as a school. New windows of granite, consonant with the style of the building, have been inserted; the interior has been plastered; the east window is of stained glass, by Hughes—the subjects being the Crucifixion, the Blessed Virgin, and St. Mary Magdalene. The chapel has been newly roofed in red deal, the bell re-hung, and an additional bell supplied. The seating, of pitch pine, will accommodate a congregation of about 70. The altar, and rail enclosing it, are of English oak; the enclosure and avenue are paved with Mintons' tiles. The granite work, &c., has been well carried out by Mr. John Aggett, of Chagford; and the woodwork by Mr. Underhill, of the same place, from drawings by Mr. Ashworth, architect, of Exeter.

DROMIN ROMAN CATHOLIC CHURCH.—On Sunday, the 22nd July, his Grace the Most Rev. Dr. McGettigan, R.C. Primate, consecrated the Roman Catholic church of Dromin, Co. Louth, Ireland. It is cruciform in plan, with tower and spire over porch; the tower is terminated with octagonal pinnacles with trefoil gables between, and from the apices of the gables commence the angles of the spire, a simple square-based pyramid, placed diagonally on tower, and terminated by a four-way cross. The length of the church from porch to chancel, within the walls, is 74ft. by 24ft. in width. The breadth across the transepts is 72ft. The roof is of wrought rafters, each pair braced by two braces crossing each other diagonally, bolted together at intersections. At the intersection of nave and transepts the valley pieces are braced in a similar manner and secured at their intersection by bolts and iron plates. Upon these the rafters and their braces are continued till they all terminate at the point of intersection. It is entirely open, and stained and varnished. The windows are lancet, filled with plain leaded quarries, with geometrical heads and borders in coloured glass. The high altar is of carved Caen stone, with marble slab and shafts. The communion rail is of pitch pine, with trefoil-headed bays, and capped with polished Riga oak. There is a very convenient suite of vestries occupying the angle between the head of the cross and one of the transepts. The walls are of rubble greenstone, with dressings of silician sandstone,

mountain, and other limestones. The works were carried out from the designs of Mr. P. Henry, C.E., Dunleer, Co. Louth.

LONDON SCHOOL BOARD.—On Wednesday the tender of Messrs. Kirk and Randall, of Woolwich, amounting to £12,430, was accepted for the erection of a school in 2 blocks to provide accommodation in all for 1,040 children on opposite sides of Nichol-street, Shoreditch. That of Messrs. Higgs and Hill, of Crown Works, South Lambeth, amounting to £5,190, was accepted for the enlargement of the school in Camberwell-road. This school is the first of those planned in accordance with the recent rules laid down by the Education Department, the main rooms being 22ft. wide, the desks only five rows deep, and the accommodation reckoned by the number of seats thus provided, showing a cost per head of £12 14s. for school buildings. The erection of additional class-rooms for the Haverstock-hill School, St. Pancras, was entrusted to Messrs. Wall Bros., of Kentish Town, at the same schedule of prices as for the school in Medburn-street, St. Pancras. For fixture and fittings for the new school in Hollydale-road, Nunhead, which accommodates 872 children, £576 19s. was voted. Arrangements were agreed to for holding the first of a proposed series of annual exhibitions of drawings by the pupil teachers and scholars of the Board schools at the Board offices, Victoria Embankment, in October next.

NETHERHAMPTON.—This Wiltshire parish church was opened on Tuesday, after a rebuilding of so thorough a character that, with the exception of the lower part of the tower and one or two windows, nothing of the original structure remains. The style of the new edifice is Decorated English of a simple type. The outer walls are of brick, faced with flint and Tisbury stone, Bath stone being used for quoins and dressings. The tower has been raised 10ft., and surmounted by a spire, sheathed with oak shingles. The roofs, which are of considerable height, are similarly covered; internally they are barrel-vaulted. The entrance porch is on the north side of the nave, and has a front of open woodwork. The altar and rails, choir stalls, lectern, and pulpit (which stands on a base of Portland stone) are of English oak and walnut wood; the open seats in the body of the church of deal, stained and varnished. The chancel and the nave passages are paved with Maw and Godwin's encaustic tiles. The heating is to be effected on Porritt's system. Mr. Butterfield, of London, was the architect; Messrs. Hale and Sons, of Salisbury, the builders; and Mr. W. Cowley the clerk of works. Including fittings, the total cost has been about £1,900.

PENSAERN.—The foundation stone of a new English Presbyterian church was laid on Wednesday at Pensaern, near Rhyll. The style is Gothic, of a Continental character. The plan is a cross, containing a nave 60ft. by 23ft.; two transepts, 16ft. by 8ft.; chancel, 18ft. by 13ft.; organ chamber and vestry, each 11ft. by 10ft. Sittings will be provided for 250 persons, in addition to available spaces for certain occasions. The exterior will be of native limestone, worked random and clean pointed, the dressings being of minera stone. The designs have been supplied by, and the work will be carried out under the superintendence of, Mr. Richard Owen, architect, Breck-road, Liverpool.

PORTON.—The ancient chapel of St. Nicholas, Porton, in the parish of Idmiston, Wilts, being dilapidated as well as unsightly, it has been replaced by a new church, erected on a fresh site, from plans by Mr. J. L. Pearson, of Harley-street, W. The new building was consecrated on Wednesday week. It is built in 14th century Gothic style, of flint with stone dressings and buttresses. Sittings are provided for 153 worshippers. The altar-rail is of scroll-work, ornamented with beaded bands of wrought iron, and is the work of Mr. C. J. Tutt, of Fisherton, Salisbury. Mr. Grace, of Lower Wallop, took the contract for the erection of the church at £1,387.

WEST ORCHARD.—This small church was reopened last week, after entire renovation and partial re-building, from the designs of Mr. T. H. Wyatt, of London. A chancel has been added at the east end, a porch next the south

aisle, and a vestry on the north-east. In the centre of the west front is a double turret of Bath stone. The roofs are panelled, with carved bosses; the seats are open, those in the chancel being of carved pitch-pine, and in the nave of stained and varnished deal. Messrs. Maw and Co. supplied the tessellated tiles for flooring. Mr. T. B. Miles, of Shaftesbury, was the builder. The cost has been £1,500.

WIGAN.—The foundation stone of the new Roman Catholic Church of St. Joseph, Wigan, has been laid. The style of the building will be Gothic. The plan is an oblong of 87ft. by 60ft., the whole available area of the church being occupied. This space will be divided into nave and aisles by an arcade of ten arches, with a lofty clerestory of triplet-lancets, from which the chief light will be derived. The aisles are ended by the side chapels. The organ tribune is above the left side of the chapel, and passes above the sanctuary to the body of the church. To the right of the church, on a narrow plot of land, a presbytery has been planned, affording rooms for three resident priests. The design is by Mr. Goldie, of the firm of Goldie and Child, Kensington. The cost of the church and house combined will be £5,647.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published July 27 contains articles on The Withdrawal of the Public Health (Metropolis) Bill, The Domestic Economy Congress at Birmingham, The International Medical Congress at Geneva, Diphtheria and Group, Some Popular Errors in Sanitary Matters, The Drainage of Bristol, Some Simple Hygienic Rules, Public Health Reports, Parliamentary Notes, Legal Intelligence, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c. Price 2s. (Annual Subscription, post-free, Eleven Shillings.) Office, 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

ARCHITECTURAL SCIENCE CLASS (Received).—A. L. B.—Attneave.—T. N.—Anbery (in reply to your note, your replies Nos. 52, 53, and 54, did not come to hand in time for examination, or they would have been noticed in our summary. They are all fair replies. Your reply to No. 53, in which you recommend the "setting" coat to be laid on while the second is moist, but firm, is the best.)

Correspondence.

AN AMATEUR'S NOTION.

To the Editor of the BUILDING NEWS.

SIR,—I have watched with interest the phases through which architecture has passed for many years, and, being possessed of artistic proclivities, have had some sympathy with the "Queen Anne" movement, as tending towards the abandonment of dull uniformity in favour of picturesque variety. A similar movement took place in Scotland a quarter of a century ago, when what has been called the "Scottish Baronial style" was revived; and there is some affinity between these two styles, keeping in view that the one is adapted to brick and the other to stone as the material for construction; but in the practice of the architects north and south of the Border there is a marked difference. In Scotland you seldom find constructed decoration; and where you do it is invariably the work of a builder's architect. Where a turret is constructed it is found to be a useful adjunct to the internal accommodation; and where a gable has been constructed it has its roof behind it, and has been so constructed as an essential feature.

Now, when I look at the designs of your most able "Queen Anne" men, I find that even they indulge in "constructed decoration," which (although not a practical architect) I feel to be essentially bad; it destroys my pleasure in contemplating a picturesque design to find that it is made up of shams. By a little care and consideration, with less effort and more reticence, the desired end could be gained without shocking architectural propriety.

These remarks are suggested by the able design of premises in Oxford-street, by Mr. Wimperis (July 13th, 1877), which, to my mind, is most satisfactory, but for one slight blemish, and that is the gablet at the angle of the two-story offshoot, which is so obviously false. It appears to me that an equally effective feature could have been designed without being false; and in architecture, as in everything else, what is false is bad—the terms are synonymous.—I am, Sir, &c., AMATEUR.
Edinburgh, July 19th.

PEEBLES PARISH CHURCH.

SIR,—I was quite as much struck with the mediæval perspective of Peebles Church as your correspondent. To see it as represented would require the varied gifts of being able to fly up several yards into the air, and then see round the corners. This, however, is poetic license with an architect in search of the picturesque. There are two serious and almost unaccountable mistakes to which, in the interests of church-planning, I would call the attention of all whom it concerns:—1st. The pulpit and pews are so placed that the congregation, when they look up, cannot fail to be blinded by a glare of light—than which, nothing is more painful to the eye. 2nd. The vestry is at an unreasonable distance from the pulpit—for instance, on communion days the elements are kept in the vestry, and two verses of the 34th paraphrase generally sung when the elders retire to bring them in; but in Peebles Church the congregation will have to sing the 119th Psalm, or improvise a processional hymn, before the elders reappear. 3rd. There is a lack of exit doors conveniently placed for so large an area.—I am, &c., J. R. W.

WAITING FOR A DETAIL.

SIR,—All persons who have been in any way party to a contract have no doubt learnt by experience that the great source of trouble is that it is undertaken before the parties know exactly what is required of them. If, before signing a contract, a builder had possession of detail drawings, would he not set about his work with much more despatch and economy? I think every contractor will endorse this, and yet who but a contractor is weak enough to sign a deed containing a clause to the effect that it may be added to afterwards? Every builder knows what it is to receive detail drawings when a job is half finished; perhaps not only showing more work than was antici-

pated, but requiring work already in hand to be altered. No doubt many of your readers can enlarge upon this subject, and perhaps suggest some plan to improve upon the present state of things. Suppose builders inserted in their tenders a clause of this kind:—"If, before signing the contract, I am supplied with a full set of detail drawings and a fair copy of the specification, beyond those for use of the clerk of the works, £ s. d. may be deducted from the amount named." Any improvement on the above suggestion will be thankfully received by, yours truly,
CONSIDER THE END.

MORE COMMISSIONS.

SIR,—Some of your trade readers may like to answer the following advertisement which appeared in Monday's *Times*. Some of your other readers who remember a recent discussion in your columns, might perhaps give a guess at the name of the accommodating and enterprising advertiser. He himself will, doubtless, be glad of the additional advertisement gratis—should you give it; and so all will be satisfied except the few purists who contend—it must be admitted with but partial success—for the dignity of the architectural profession.—I am, &c., ONE OF THEM.

[Copy of Advertisement.]

"An architect, with offices centrally situate, would be willing to undertake agency business for manufacturers, owners of property, &c. Apply, by letter, to S., care of Mr. Plummer, News Agent, Brownlow-street, Bedford-row, W.C."

Intercommunication.

QUESTIONS.

[5073].—Wall Decoration in Distemper.—The *Lancet* advocates, from a sanitary point of view, a simple mode of wall decoration which has also many aesthetic advantages—namely, the use of pale distemper colour instead of paper-hangings. It is not generally known, the *Lancet* says, that this distemper can be applied over paper of almost any description. To those whose eyes are constantly tormented by a hideous paper inflicted by their landlord, this cheap and effectual mode of relief will be sure to commend itself. Distemper can be applied with especially good effect over those rich flock papers that so often poison and encumber dining-rooms. Can any one give me plain instructions for carrying out this hint? How is the distemper prepared? Can any of Szecelmeys, or the Silicate Paint Company's preparations be utilised?—KAPPA.

[5074].—Cleaning of Plaster Casts.—Could any of your subscribers inform me how I can clean the above, and also to join one which is broken?—J. T. G.

[5075].—Tar Pavement.—I shall feel obliged if some correspondent will kindly inform me of the best description of artificial asphalt or tar paving, the necessary thickness, the proportional ingredients, and the mode of preparing and laying the same. I wish it not to soften in the sun, and to be capable of withstanding great wear, as it will be on public footways.—SURVEYOR.

[5076].—Legal Fees.—Can an architect's assistant claim the fees allowed by law to a professional assistant as witness in a lawsuit, or are the fees claimed by his employer? I should be glad to know what is usual among the profession in such cases.—KENT.

REPLIES.

[4978].—Refusing to Return certificates.—This question, kindly inserted in the "Intercommunication" of your paper of the 20th of April last, remains unanswered. Would some reader inform me if it is customary to return original certificates, and oblige—AN ILL-USED ARCHITECT.

[5059 and 5069].—Cast-Iron Girder.—"G. H.," in your issue of July 20th, suggests 9in. for the depth of a cast-iron girder of 16ft. bearing to carry a floor. I cannot think it would be safe in practice to make a girder of this bearing, and for the purpose stated, less than 12in. deep, however little the load might be. If required to be of less depth the girder should be of wrought iron.—M.

[5061].—Removing Putty from Old Sashes.—Well slacked lime mixed with a saturated solution of washing soda, then brushed on the putty, will soften the same, which can then be easily removed.—J. T. G.

[5064].—Iron Girders.—Yes, I have heard a practical engineer state that rust would preserve the iron provided it were not disturbed.—A. V.

[5064].—Iron Girders.—A thorough painting will prevent further corrosion of the iron; but it is best to scrape the rust off first.—H.

[5065].—Main Sewers.—1 in 100 is a good fall, and its discharge is about 2,14ft. per minute. In reply to the third question, a charcoal filter is not required, but I should recommend several ventilating-shafts as proposed. 4th. A 4½in. ring of brickwork

would do if properly moulded and cemented, but I should prefer a stoneware invert. Calculate for 30 gallons a head for the houses, the sewer you mention will be sufficient to drain a population of 10,000. Additions to the stream increase the velocity, so that the same area becomes sufficient for any number of smaller inlets. A 15in. sewer with a fall of 1 in 100 is sufficient to drain 250 houses of ordinary size.—G.

[5065].—Main Sewers.—1. Take the number of houses, take an average of five persons to each, and the water supply at 15 gallons per head per day—if with water-closets, say 20 gallons—one-half of which will be used during the busiest part of the day, say, in 8 hours. This will give the amount of sewage to deal with. But the question of rainfall is a matter of more moment in deciding the capacity of sewers. Take the area drained, and allow a depth of from 3in. to 1in. per hour, if in a very rainy district. 2. Yes. 3. Works efficiently if there are plenty of ventilator-gratings, and if at every man-hole chambers wooden flap doors are hung with brass hinges, so as to float on the water, and cause each man-hole grating or ventilator to ventilate its own length, instead of allowing the noxious gases to rise to the highest ends. 4. Never heard of sides being made of less thickness than invert or arch—rather the other way, as they form the weakest part of an egg-shaped sewer. In a 3ft. 6in. x 2ft. 6in. sewer make it 9in. brickwork.—ASSISTANT BOROUGH SURVEYOR.

[5067].—Measuring Plasterers' Work.—In ceilings measure from wall to wall. If there is a cornice then a deduction must be made of one projection of the cornice each way. On walls collect the round of walls for the length and for the height taken from top of skirting grounds to the ceiling. Take all the additions and deductions as they may occur. If there is a cornice to the room deduct one-third of the depth of cornice.—A. V.

[5067].—Measuring Plasterers' Work.—It is usual to deduct for openings, but to allow half depth of cornice, and to take height of walls from top of the skirting grounds.—SURVEYOR.

[5068].—Where to Place the Felt in a Roof.—The lap for countess slating in good work should be 3in., and the slates bedded in patent cement. The slates should be nailed to the battens, and under the battens should be the felt.—A. V.

[5068].—Where to Place the Felt in a Roof.—The gauge for countess slates is 8½in., and a 3in. lap is sufficient for the roof named. The felt is usually placed under the slates, though if it is placed on the ceiling-boards the effect will be the same.—ARCHITECTUS.

[5068].—Where to Place Felt in Roof.—I should think a 2½in. lap, considering the pitch of roof, and its being felted, would do. A 3in. would be ample. It is my opinion you would be right in felting the ceiling above collar beam. You would prevent effectually, in stormy weather, by this means, in addition to the closing of the ventilators, all down draughts on the heads of the congregation. I have tried it in a large Wesleyan chapel, and so far it answers well.—W. M. R.

[5070].—Country House.—If the water can be conveyed the distance you name by an indiarubber hose, the extra cost would be little or nothing, especially if a contractor of means, possessing ample plant, carries out the work. If, however, it has to be done by water-cart or buckets, the cost would be, I should think, from £10 to £20 extra. The well in an ordinary situation would cost—constructed as you describe—about £1 per foot run, if not exceeding 70ft. deep.—W. M. R.

[5071].—Proportion of Rooms.—Flat ceilings may be lower than eaved. If the room be square height should not exceed ½, nor less than ⅓, and when oblong, height may be equal to width. Coved rooms, if square, must be as high as broad; when oblong, height may be equal to width, or more. Galleries should, at the least, be 1½ their width, or more.—A. V.

STATUES, MEMORIALS, &c.

BLenheim PARK.—The monument erected by the great Duke of Marlborough in Blenheim-park is undergoing restoration. The design consists of a lofty column, around the base of which is engraved an account of the many victories and public services of his grace. Upon the capital is a colossal statue of the duke, dressed in the costume of Augustus, holding a figure of Victory in his hand. From the effect of lightning, or long exposure to the weather, the latter has fallen away, and other parts begin to show signs of wear. The work, together with the restoration of other sculptures about the palace at Blenheim, has been entrusted to Mr. Roddiss, of Birmingham, under the direction of Mr. F. B. Osborne (as noted on the following page).

BRADFORD.—On Wednesday Mr. Bright unveiled a statue of the late Mr. Cobden, which has been erected in the Bradford Exchange. Mr. Butler—an artist strongly recommended by Mr. Foley—executed the statue, which has been cut from a block of Carrara marble weighing nearly 12 tons in the rough state. The figure, which, with the plinth below, is 7ft. 9in. in height, and of proportionate breadth, stands on a polished granite pedestal, erected by Messrs. F. Stoke and Co., of Bradford, and on the front of the pedestal is the name "Cobden," which is encircled by the motto,

"Free trade, peace, and goodwill among nations." An inscription on the back bears the name of Mr. Booth, the donor, and states that he was led to erect the statue because of admiration for the character and labours of Mr. Cobden.

THE SOLDIERS' AND SAILORS' MEMORIAL.—Two large bronze figures, representing peace and history, have just been shipped by the s.s. Batavia for Boston. They were modelled by Mr. Martin Milmore, at his studio in Rome, and cast by Messrs. Cox and Son, at their bronze foundry, Thames Ditton. These complete the above important memorials of the war between the North and South. The monument, which consists of a large column ornamented with nine figures, trophies, wreaths, and several bas-reliefs, all in bronze, is to be unveiled in September next.

STAINED GLASS.

ASHBOURN.—The restoration of the window, of flamboyant design, over the door of the north transept of Ashbourn Church will shortly be completed. The subject intended to be illustrated is the Crucifixion. The work has been entrusted to Messrs. Hardman, of Birmingham.

JESMOND.—The east window of the parish church of Jesmond is about to be filled with stained glass by Mr. Baguley, of Newcastle-on-Tyne. The artist has apparently based his design upon the fact that Jesmond, or "The Mount of Jesus," is the name of the church, and the subjects selected for the lower part of the five lights are taken from the "Sermon on the Mount." The upper portion is occupied by our Lord's ascension from Mount Olivet. The tracery, copied from one of the windows in Melrose Abbey, contains the subject of Christ sitting in glory, and angels in the act of adoration. The cost of the whole will be £500.

PARLIAMENTARY NOTES.

NEW LODGE IN HYDE-PARK.—Mr. Rylands last week asked the Secretary to the Treasury if he could state to the House the circumstances under which Mr. Albert Grant was asked by the Treasury to pay the cost of the erection of a new superintendent's lodge in Hyde-park. Mr. W. H. Smith: When his own house was in course of erection, Mr. Grant applied to the First Commissioner of Works for the removal of the brick wall of Kensington-gardens and a lodge which were immediately opposite the new house, undertaking to replace the wall by an iron railing, and to pay the cost of the erection of a lodge in any spot that might be deemed suitable for the residence of the park superintendent. The First Commissioner of Works agreed to the proposals of Mr. Grant, as they were calculated to improve that portion of Kensington-gardens which was affected by them, without involving any charge upon the public purse.

LEGAL INTELLIGENCE.

NOT AN OFFICE, BUT AN EMPLOYMENT.—In the suit of "Frederick Law Olmsted v. the City of New York," the Superior Court, General Term, Judge Speir has decided that the position of landscape architect of the parks is not an "office," but an "employment." Mr. Olmsted, while holding the position of landscape architect, accepted the position of Commissioner of the State Survey. He received no salary for the latter position, and resigned it within three months; but the city declined to pay him for that time, on the ground that the acceptance of any second office is a resignation of a previously held city office. Judge Speir holds that the position on the parks was not an office, and affirms the verdict in Mr. Olmsted's favour.

FRAUDS ON THE ARTISANS' AND LABOURERS' DWELLINGS COMPANY.—The inquiry into the alleged frauds on the Artisans' Dwellings Company, by Dr. Baxter Langley, the chairman; Mr. W. Swindlehurst, the secretary; and Mr. E. Saffery, an estate agent, was resumed at Bow-street, on Wednesday. A new case was proceeded with relating to the purchase of the Cann Hall Estate, part of Epping Forest, by Saffery, for £35,000, which was sold to the company for £48,000; and it was alleged that the defendants divided a large portion of the difference between them. The defendants were again remanded, Dr. Langley's bail being increased.

CHIPS.

Mr. Corbett has resigned his appointment as township engineer to the Bray Commissioners, in consequence of ill-health.

The foundation stone of the new buildings at Cowley Military College, Oxford, was laid on Saturday.

The Town Council of Leicester has under consideration the purchase of public baths in King-street, now rented by the Corporation of Messrs. L. P. Clarke and Co.; the premises are offered for £5,300, and it is estimated that nearly £1,700 would have to be laid out on alterations, and the provision of powerful engines and boilers. Other baths in Bath-lane have been also offered to the Leicester Town Council, the total cost of their transfer being estimated at £12,000.

The land-slip at Beacon-hill-slope, Bath, has recently become more extensive, and many houses at Hedgemoor and Walcot Church have been injured by the sliding away of their sub-soil.

Mr. J. S. Raven, the well-known landscape painter, has been drowned whilst bathing at Harlech. Mr. Raven, who was in his 50th year, has been a very frequent exhibitor since 1849, at the Royal Academy and elsewhere.

The Improvement Commissioners of Bournemouth decided on Monday, to appoint a special clerk of works to carry out the details of the inland drainage scheme; the original resolution, which was lost, proposed that the works should be carried out under Sir Joseph Bazalgette's direction.

A new Congregational Church in South-street, Romford, was opened last week. The building is Early Gothic in character, is faced with Kentish rag and Bath dressings; a prominent feature is a slated spire, 64ft. in height. Open seats accommodate 340 adults on the ground-floor, and 130 in the galleries. Mr. E. C. Allam was the architect, and Messrs. Staines and Co., of London, the builders. The total cost has been £4,560.

Under "Competitions," last week, Mr. Geo. Dale Oliver was stated to be of Newcastle-on-Tyne. It should have been Mr. Geo. D. Oliver, of the firm of Hetherington and Oliver, architects, Carlisle.

The Bradford Band of Hope Union has several times during the last twenty years presented to the Corporation some work of art for the adornment of Peel-park, as a mark of their gratitude for being allowed the use of the park. On Saturday last a statue symbolising Spring was unveiled; it forms a companion to a somewhat similar figure emblematising Autumn, presented by the Union in 1869. The statue and pedestal are 13ft. 6in. in height, and have been wrought from two blocks of stone from Bolton Woods. Mr. W. Aston, of Manningham, was the sculptor.

The discovery of a sub-lacustrine village of about 200 houses, disposed over an oblong surface, is reported from the Lake of Geneva. The ruddy hue of the buildings appears to indicate that they were covered with the vermilion cement, used alike by Celts, Cimbric, and early Gauls. The Council of Vand has decided to have the site of the dwellings inclosed by a jetty stretching from the land, and to drain off the water so as to expose what gives promise of being a very interesting archaeological discovery.

At Poole Quarter Sessions, last week, Frederick Dashwood, formerly a builder at Bournemouth, was sentenced to three months' imprisonment, with hard labour, for breaches of the Debtors' Act, 1869, the principal charge being that prisoner, being a bankrupt, omitted to disclose all his property.

The Corporation of Dublin have agreed to the purchase by the South City Markets Company of a number of premises in Great George, Lower-Stephen, Exchequer, St. Andrew, and William-streets, at sums equivalent to twenty and twenty-five years' purchase.

A new workhouse is in course of completion for the West Ward guardians at Shap. Mr. Pattinson is the contractor.

The surveyor and inspector of nuisances for Bridport, Mr. Henry Patten, died last week. He had held the appointment from the date of the formation of the Local Board.

The new extension railway from Kingsbridge, Dublin, to North Wall, was inspected preparatory to opening on Saturday last. It has been the most expensive line yet constructed in Ireland, having cost £60,000 a mile, while, although it is but 2½ miles in length, the land cost an additional £200,000. The contract was let in 1873 to Mr. Thomas Chester, an English contractor—Mr. William Baker, of the London and North-Western Railway, and Mr. Valentine Browne, of the Great Southern and Western Railway of Ireland, being the joint engineers. The line crosses the Liffey on a bridge of stone and iron, with a centre span of 110ft. At North Wall a station has been erected for the London and North-Western, at a cost of £40,000, and others are being built for the Midland (England) and the Great Southern and Western (Ireland) Railway Companies.

The Corporation of Leicester has been cast in damages at the assizes recently held in that town for damage caused to a ratepayer's property through the improper construction and insufficient cleansing of the public sewers.

Mr. Alfred M. Fowler, borough engineer of Salford, has been elected engineer to the borough of Newcastle-on-Tyne.

Spanish engineers are reported to have arrived at Marseilles for the purchase of apparatus resembling that being used for the St. Gothard tunnel. It is proposed to bore a tunnel from near Algeciras, in Spain, to a point between Tangiers and Ceuta, a distance of nine miles. The cost is estimated at £1,000,000, and the promoters are said to have already raised a considerable sum.

A new chancel, erected at a cost of £1,500, was opened at Pont-aber-Bargoed, in the parish of Gelli-gaer, last week.

Extensive improvements are being pushed forward at Mount Stuart House, Rothsay, the seat of the Marquis of Bute.

Our Office Table.

THE soirée to celebrate the jubilee of the Operative Carpenters' and Joiners' Trade Society was held at the lesser Colston Hall, Bristol, last week. Tea was laid at six o'clock, and about 500 sat down. Mr. J. Westaway, the chairman, said that was the first time a gathering of the kind had taken place, but he hoped in fifty years to come a meeting might be held to celebrate the centennial of the union. He spoke of the spread of the principles of trades unionism, and said it was the wish of that particular society to settle all disputes, or suggested alterations of the wages, by conciliation or arbitration, believing that strikes were ruinous to all the parties concerned. At the end of the last financial year (August, 1876) there were 11,841 members belonging to the society, the accumulated capital being £22,500, after spending during the year £12,680, only £190 being for strikes, thus proving, the speaker remarked, that this system of warfare was dying out. There are about 500 members of the union in Bristol, under whose auspices the soirée was held.

THE Society of Engineers last week visited the new works in connection with the extension of the Victoria Docks. The works are about a mile and three quarters long, and include first the connection with the present docks, beyond which will be a basin having 80 acres of water area, with graving docks annexed on the south side. Near the junction of the new with the old docks formerly ran the North Woolwich Branch of the Great Eastern Railway, which has been diverted, and which will eventually be restored to its former line of route, but not to its former level, as it will pass through a tunnel 40ft. below that level. This tunnel is a fine piece of work, and has an incline of 1 in 50 from either end to the central point, where it passes under the dock. When the docks are finished there will be 25ft. 6in. of water over the tunnel, which is 1,800ft. long. The main basin will be about 6,500ft. long, and 540ft. wide, with a minimum depth of 27ft. of water. Beyond the main basin is an entrance basin nine acres in extent, which alone is just equal to the area of the present St. Katherine Docks. The entrance lock is 800ft. long by 80ft. wide, and is a magnificent piece of work in brick and stone, with the necessary gates, and sluices and channels for the entrance, regulation, and exit of the water. Beyond the entrance gates will be couple of open timber jetties, each extending 250ft. into the river. There will be a depth of 33ft. of water over the entrance sill. When complete the old and new docks will have an aggregate length of about 6 miles of quay. The concrete walls of the dock are progressing rapidly. They are built up in solid concrete on the gravel, and are 18ft. wide at the base, benched up to 7ft. wide at top, and 34ft. high. It is estimated that the works will cost about three-quarters of a million of money.

A CORRESPONDENT of *La Nature* relates the following:—"In the building of a new chateau in the Department of Aisne, materials from the old chateau were used as much as possible. This building dated from the end of the 17th

century. One large piece of stone had in the middle of one side a large moist portion: it seemed otherwise sound. The stone was sawn to remove the moist exterior (the moisture was attributed to a flow of water into the stone in the old building), and was put in position in a window. Time went on, and the stone (much to the builder's disappointment) did not dry, but presented a villainous contrast to its surroundings. It was at length decided to remove and sacrifice it, in order to find out the cause. On sawing right through the moist part, a large irregular cavity (about 0'15m. in all directions) was found in the centre, and in this cavity an enormous live toad, which by squatting had escaped the saw!" The story seems well authenticated.

THE monument of the Duke of Marlborough in Blenheim Park, which is 130ft. high, has just been restored under the direction of Mr. F. B. Osborne, by Mr. Joseph Blackburn, of Nottingham, with the aid of his patent scaffolding, which was fixed at its usual cost of five pounds. The operation of fixing the scaffold somewhat astonished the country people, but it is in reality simple enough. The first operation was nothing more than flying a kite over its top, and when well in position suddenly running out a quantity of the string, thus causing the kite to drop on one side of the monument, and forming, as it were, a communication right over the monument from one side to the other. A slightly thicker string was next attached, and drawn over; then a still thicker one, till at last a strong rope, about an inch in diameter, with a "pulley" fastened in the centre, was pulled over, till the pulley reached the parapet; around this "pulley" is a smaller rope, called the "endless one;" to this rope a seat was affixed at one part, and at another two weights of about equal balance to the man who ascended. The figure of John, first Duke of Marlborough, is 11ft. high, and made of lead, filled in with concrete, as are the eagles at his feet, and the scroll in his hand. The figure of "Victory," which he formerly held in his right hand, but which some time back mysteriously disappeared, was found lying on the parapet. This figure of "Victory" is in the shape of an angel, and is also made of lead, and weighs about three-quarters of a cwt. It was generally supposed that, at one time, a helmet covered the head of the statue, but such appears not to have been the case, as the curls around the head are perfect. On the left shoulder of the statue there is the following inscription, cut with a pen-knife:—"June 18, 1781, G. Austin."—In another column, under "Statues and Memorials," will be found further details as to the works of restoration now being carried out in Blenheim Park.

THE Select Committee on the Metropolitan Fire Brigade have finished their report. They declare that the present arrangements for extinguishing fire in the metropolis are faulty, and urge the consolidation of the police forces, the fire brigade, and the water supply, under one management. They recommend the transfer of the fire brigade from the Metropolitan Board to the Commissioner of Police, but to remain under the immediate control of an Assistant Commissioner, with authority to

act in the City of London as well as the rest of the metropolis. They also recommend that all police-stations and fixed points should, where practicable, be used as fire-brigade stations; that the present rate of one halfpenny on the consolidated rate should be abolished in favour of one of one penny in the Metropolitan Police District; that the Government contribution be correspondingly increased; that the contributions from insurance companies should remain as at present; and that a charge be levied on the owners of all uninsured property saved from fire. It is further advised that the various existing water systems should be consolidated in the hands of a public authority; that no new theatres or music-halls should be opened till certified as safe from risk of fire by the Metropolitan Board, and that that body should be empowered to call upon owners of existing structures to remedy apparent causes of danger.

THE fourth annual conference of the Association of Municipal and Sanitary Engineers and Surveyors was held on Thursday and Friday in last week at Bristol. Mr. F. Ashmead, the President, delivered his inaugural address, and papers were read "On the Drainage of the Borough of Bristol," by the President; "On Some Popular Errors in Sanitary Matters," by Mr. David Davies; and "On the Water-Bearing Strata of Bristol," by Mr. W. W. Stoddart. Reports of these will be found in *Public Health*. The annual dinner was held at the Clifton Downs Hotel.

DEALS—BATTENS—FLOORING. — Send for price list.—R. MAY & SON, Timber and Slate Merchants, Acorn Wharf, Old Kent-road, London, S. E.

Trade News.

WAGES MOVEMENT.

CARLISLE.—As yet no settlement has been effected between the cabinet-makers of this city and the employers relative to the advance of wages asked for some months since. Business is not brisk, and the masters are able to meet orders with the aid of men from neighbouring towns. The strike is expected to be continued for some months.

CRIEFF.—The master joiners in Crieff, who, about two months ago, refused to give the workmen a rise of 3d. per hour, have granted the request, and the uniform rate of wages is now 7d. per hour.

KENDAL.—The strike of the joiners at Kendal has terminated, and the men have resumed work, after having been out nine weeks. The demand was for 32s. a week, and the employers recently offered to give that sum for eight months of the year, and 30s. for the remaining four. It has been arranged that the men shall receive 31s. per week during the coming winter (from November to February), and afterwards 32s. per week.

MANCHESTER.—The number of joiners on the pay-books at the close of last week—the twelfth week of the dispute—was 928, and each man on strike is reported to have received as his week's allowance 3s., in addition to the 15s. or 16s., as the case may be, which is the amount of his strike pay. The balance-sheet issued shows that the income from "external sources"—that is, from other trades or from joiners' societies in other towns—is £2,686, and that the balance now in hand is £86 13s. The principal

towns from which levies continue to be drawn are Sheffield, Birmingham, Liverpool, Nottingham, Bradford, Southport, Bolton, and London; and in most cases the levy, varying from 6d. to 1s. per man, has been made compulsory. The funds derived from this source average about £300 per week. At a meeting of the United Trade Committee, on Monday evening, it was reported that six firms had that morning opened their workshops at the advance sought by the men, one firm alone having engaged 30 workpeople. During the day applications for men were received from various towns, and the number at present answering the roll is 850. It was stated that the strike pay has again been increased 1s. per man.

SUNDERLAND.—The strike of the masons at Sunderland, which commenced last Monday week, has ended by the concession of the men's claim by the masters. It was not a question of wages, as the Sunderland masons work on the hour system, but of the introduction of certain new rules of work promoted by the Central Executive of the Workmen's Union. The chief rules are:—The abolition of sub-contracting for labour; the limitation of apprentices to a proportion of one to every five men (unless the lads be sons or stepsons of any mason employed on the work); and the allowance of travel time, at the rate of three miles an hour, to all jobs more than one mile distant from the centre of the town, which, in the case of Sunderland, is reckoned as "Mackie's Corner." Sunderland is the first town in the North of England in which the workmen have succeeded in getting these rules adopted.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's Pills, early sought and properly taken, would avert sickness from many happy homes. Nature needs only a little assistance, as afforded by this medicine, to stamp out imminent illness. Failing appetite, indigestion, flatulency, hysterics, colics, constipation, and flying pains through bones or muscles readily succumb to Holloway's treatment.

TENDERS.

ABERYSTWITHE.—For alteration to Blue Bell Tavern Terrace-road, for Mr. David Roberts, the Brewery. Mr. Walter W. Thomas, architect, Liverpool:—

- Day Work: Jones, David, masonry and joiners' work. Griffiths, J. J., plastering. Jones, T. H., painting, glazing, &c.

CAMBERWELL, S.E.—For the enlargement of the school in Camberwell-road and George-street, S.E., by the erection of boys' and girls' departments for 350 children, for the London School Board. Mr. E. R. Robson, architect:—

- Brass, W. £3,163 Downs, W. 5,682 Wall Bros. 5,640 Newman and Mann 5,572 Nightingale, B. E. 5,543 Thompson, J. 5,472 Jerrard, S. J. 5,352 Tyrerman, J. 5,351 Higgs and Hill (accepted) 5,190

[This school is the first planned under the new rules of the Education Department. Cost of site, so far as purchased (area 25,140 sq. ft.), £9,905 11s.; boys' and girls' school buildings, including teachers' rooms and closets, £4,570; tar pavement, £270; boundary walls and gates, £550; cost per head of school buildings only, £12 13s. 9d.; total cost per head of buildings, including boundary walls, tar-pavement, &c., £14 8s. 4d.]

CARDIGANSHIRE.—For the erection of school and master's house at Goginan, for the Melinodr School Board. Mr. Walter W. Thomas, architect, Liverpool:—

- Charles, J. and J. £1,087 Jones, T. (accepted) 1,027 Griffiths, T. 935

CARDIGANSHIRE.—For the erection of a cottage villa at Capel Bangor, for Mr. Henry W. Morgan, Bronllan-guria. Mr. Walter W. Thomas, architect, Liverpool:—

- Williams, James, Aberystwith £800

CARDIGANSHIRE.—For the erection of a cottage villa at Llanfanzel, North, for Mr. David Jenkins, Panty-dderwen. Mr. Walter W. Thomas, architect, Liverpool:—

- Hamer, Daniel £332 10 0

CHWILIG.—Chwilig Independent chapel, Carnarvon-shire. Owen Moins Roberts, architect:—

- Jones, William, and Humphreys, Portmadoc £274 Criecieth, Robert, Thomas, 195 Owen, William, and Edwards, Chwilig 192

ESSEX.—For rebuilding the parish church of St. Lawrence-on-Sea, near Maldon. Mr. R. Wheeler, Tunbridge Wells, architect:—

- Letch, W., Braintree... .. £1,920 Gozzeth, H., Woodham 1,616 Read, C., Burnham 1,598 Stammers, Wild, Southminster (accepted) 1,553

KINGSTON.—For house and offices at Kingston-hill, for Dr. Kane. Mr. Henry Macaulay, architect; quantities by Mr. Alfred Boxall:—

- Wells £2,550 Oldridge 2,463 Todd and Saunders 2,437 Jarvis 2,375 Lane (accepted) 2,306

LONDON.—For alterations and repairs at 21, Woburn-square, W.C., for the Misses Thompson:—

- Henson £320 Phillips, Messrs., and Son (accepted) ... 301 For decorations: Phillips, Messrs., and Son 231

LONDON.—For rebuilding the "Boy's Refuge," Great Queen's-street, Lincoln's-inn-fields, for the committee. Mr. W. Williams, secretary. Messrs. E. Habershon and Brock, architects:—

- Coloman £8,579 Brown and Robinson 8,356 Fenor, Julian, and Co. 8,355 Nightingale 8,058 McLachlan 7,960 Bowman 7,900 Mattock Brothers 7,833 Brass 7,698 Haynes 7,300 Newman and Mann 6,725

LONDON.—For cleaning and painting works at Christ's hospital, Newgate-street, E.C. Mr. Thomas Renton, architect:—

- Shaw £735 Morby 715 Hayward and Son 700 Patman and Fotheringham 685 Pitman and Cuthbertson (accepted)... .. 610

LONDON.—Alterations, 177, East India-road, for Mr. Hall. Messrs. A. and C. Harston, architects:—

- Johnson £322 3 0 Sheffield (accepted) 297 0 0

LONDON.—Alterations, 175, East India-road, for Mr. Chapman. Messrs. A. and C. Harston, architects:—

- Wood and Sleep (accepted) £165

LONDON.—Stepney Union Workhouse, Bromley, enlargement of boiler-house. Messrs. A. and C. Harston, architects:—

- Seward £181 Heiser 165 Le Frere (not in attendance) 148

PORTMADOC.—Wesleyan Methodist chapel, Portmadoc, new gallery and other alterations. Owen Moins Roberts, architect:—

- Lloyd, Thomas, Portmadoc £542 Jones, W., and Humphreys (accepted) ... 490

SHOREDITCH.—For the erection of schools for 1,040 children, on opposite sides of Nichol-street, Shoreditch, for the London School Board. Mr. E. R. Robson, architect:—

- Wood, F. and F. J. £14,589 Perry and Co. 13,956 Pritchard, G. S. 13,901 Brass, W. 13,564 Higgs and Hill 13,384 Boyce, T. 13,292 Atherton and Latta 13,150 Sheffield, A. 12,983 Kirk and Randall (accepted) 12,430

[This school is one of those which has been planned with the main rooms 24 feet wide by the consent of the Education Department. Cost of site, as far as purchased (area 14,860 sq. ft.), £10,719 17s.; cost of boys' and girls' school buildings, including teachers' rooms and closets, £6,591; cost of infants' school buildings, £5,103; cost of tar pavement, £36; cost of boundary walls and gates, £287; cost of schoolkeeper's residence, £363; cost per head of school buildings only, £11 4s. 9d.; total cost per head of buildings, including boundary wall, schoolkeeper's house, &c., £11 19s.]

TOTTENHAM LOCAL BOARD.—For the following works:—

Bonds-green drainage: The tenders received varied from £5,650 down to £299, but five of the tenders received were declared to be informal, and therefore excluded, and of the two remaining that of Messrs. Humphries and Son, being the lowest, at £3,250, was accepted. For the Penners-brook bridge contract seven tenders were received, which varied from £1,300 down to £670, and the latter, that of Messrs. Humphries and Son, was accepted. For the large suitable for the river Lea two tenders were received, and it was referred to the surveyor to examine the barges. Two tenders were received for supplying a steam roller of 15 tons, and that of Messrs. Aveling and Porter, of Rochester, at £612, with 23 per cent. discount, and a month's trial previous, was accepted.

BATH STONE OF BEST QUALITY. WESTWOOD GROUND BOX GROUND, CORSHAM DOWN, and COMBE DOWN.

RANDELL, SAUNDERS, & CO., LIMITED Quarrymen and Stone Merchants.

Prices, delivered at any part of the United Kingdom, furnished on application to

BATH STONE OFFICE CORSHAM, WILTS. [ADVT.]

Geometrical and Encaustic Tile Pavements in every variety. Over sixty New Designs at 5s. 6d. per yard super. The Tiles are excellent, both in quality and colour.—BUILDING NEWS.—"They are of great excellence in design—the material is not surpassed by any found in this kingdom."—Art Journal. "For paving conservatories they are the best tiles we have seen; there can be no end to their wear."—Gardener's Magazine, &c. &c. Designs and sample Tiles free on application to W.B.B.'S WORCESTER TILERIES COMPANY (Limited), Worcester.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL-POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world and the maker, 113, Holborn Hill. Use no substitute.—[ADVT.]

TO CEMENT MANUFACTURERS,

CAPITALISTS, and PUBLIC COMPANIES.—A very fine BED of CEMENT MUD has been discovered in Essex, within easy water carriage of London, affording the best possible site for erecting large cement works in the most economical manner.—For full particulars apply to E. SALTER, Esq., Estate Surveyor, 87, Queen-street, E.C., London.

BRICKS FOR SALE.—A large quantity

of BRICKS for SALE, now standing on the Queen's Park Estate, Harrow-road, W. May be seen by order of Mr. SEARLE, Sub-manager on the Estate. Tenders for the purchase of the same in large or small quantities, may be sent on or before August 1st to the Artizans', Labourers', and General Dwellings Company (Limited), 34, Great George-street, Westminster, S.W. JOHN KEMPTER, Hon. Sec. pro tem.

MORTAR MILLS.—Ready for immediate

delivery, 3 MORTAR MILLS, with 7ft. pans. Other sizes in stock and progress. These Mills are all made to fixed sizes, and duplicate parts are kept constantly in stock. They are the cheapest and best in the market, and the weights are guaranteed.—For particulars, prices, and terms, apply to J. GARVIE, Jun., & Co., Albion Iron Works, Aberdeen.

THE WORKING MEN'S MUTUAL SOCIETY (LIMITED).

1, LEADENHALL STREET, LONDON.

To Persons desirous of Making Provision for the Future, of leaving their Families well off at the Time of Death; or wishing to procure an Advance of £100 and upwards, this Society is specially recommended.

From the Monthly Guide to Investors, July 26th.

"Our readers will no doubt have remarked that for the past six months or twelve months we have refrained from noticing any companies or societies, or anything appertaining thereto; but we have now much pleasure in directing special attention to the WORKING MEN'S MUTUAL SOCIETY, and from inquiries we have made at the offices of the Institution in question, and from other sources, we do not hesitate to say that this should be supported by every household in the Kingdom, and by every-body in employment of any kind.

"It offers a safe and lucrative means for depositing savings, and also great advantages to borrowers.

The moneys which are subscribed by the members are advanced every three or four weeks to those who tender the highest premiums, the loan being repayable with the premium in quarterly instalments spread over twenty years; or if it be in any time under that period, discount is allowed.

These premiums, which are paid for the advances, form the profits of the Society; and they must undoubtedly be large, when it is borne in mind that, as they are paid back to the Society, they are re-advanced again and again. Indeed, the profits are so large that they are enabled to advance every fourth month a large sum (one of all interest or premiums, the members entitled to receive the same (£100 each) being determined by drawing in the presence of a Notary Public.

"For instance, supposing a person holds an advance certificate numbered 1,000, if that number be drawn, the holder becomes entitled to a loan of £100, which is duly paid over to him on his giving security for its payment (say the security of himself and a friend).

"The £100 is repayable in quarterly instalments of £1 5s., making £5 a year.

"Therefore, for advances by drawing, no charge whatever is made.

"If a member requires a speedy advance, he must 'tender' for it; and if his tender be the highest, he will at once get it; if it be too low, he continues to tender at future advances until he has secured the sum he requires.

"Supposing a person procures a loan of £100 by tendering £100 for it, he will have to pay to the society £2 10s. per quarter, making £10 a year—so in twenty years he will have paid off his entire debt.

"The terms of repayment certainly come within the range of most persons' incomes, however humble they may be.

"A person procuring an advance by 'drawing' continues to pay his subscription of 2s. per month in respect of the certificate which obtained the advance; but persons obtaining an advance by 'tender' may discontinue such payments, and the amount at their credit can be withdrawn.

"We heartily commend this Society to all persons—those wishing to borrow, and those wishing to leave their families well off (for 2s. 6d. payable monthly will have amounted to £150 in some fifteen years)."

Sunday Times, Oct. 15th.

"This Society offers a safe and lucrative means for depositing savings."

Christian Globe, Oct. 15th.

"It presents, according to the soundest principles of political economy, a safe and lucrative means for depositing savings, and also furnishes unquestionable advantages to borrowers. . . . Nothing could be more simple and equitable in its nature and results."

The Weekly Times, Jewish World, South London Chronicle, Foresters' Journal, and many other newspapers of standing have recommended this Society for the deposit of savings, and to prove an advance.

£400 was advanced in July; £500 in August; £700 in September; £800 in October; £900 in November; £1,000 in December; £1,000 in January; £1,000 in February; £1,000 in March; £1,000 on May 1st; £1,700 on May 31st, and £1,000 on June 30th to the holders of the following Certificates:—Nos. 4107, 3611, 2935, 7481, 1158, 4020, 4538, 2274, 2151, 2937.

The next advances will be £1,000 on July 31st; £1,000 in August, and £1,000 in September, all by Tender (i.e., by paying interest for the loan).

Successful members are duly informed the same day by letter. Unsuccessful members continue to participate in future advances until they have procured the sum to which they are entitled.

Persons who only require £100 need only one Advance Certificate, which is 5s. per month. There are no entrance fees or back subscriptions. No liability is incurred by joining this Society, it being limited, and persons do not lose their subscription of 5s. per month, for they may be withdrawn with interest and bonus. Persons who require more than £100 must hold an Advance Certificate for each £100 required, each certificate being 5s. per month.

Every member should provide himself with a copy of the Articles of Association (otherwise called "Rules"), price 6d. Non-members can have copies, 6d. Stamps are not to be sent as payment of subscriptions.

According to the new rule of the Society, non-members may witness the opening of the tenders or drawings as well as members. Early application should be made for admission tickets, as only fifty can be allowed to attend, so as to prevent overcrowding.

The Society is open to persons of all classes in town or country, and male or female.

Prospectus and stamp. Rules, 6d. Persons making inquiries must send a stamp.

Unsuccessful members says:—"The Public are thus enabled to procure an advance on such extremely easy terms, and the mode of repayment is made in such small sums and spread over so long a time (twenty years), that no one wishing to start himself in business, or desiring to acquire land, houses, stocks, shares, or other property, need be without the means."

CHARLES MORGAN, Assistant-Secretary.

SPECIAL NOTICE.

The Working Men's Mutual Society (Limited).

The Offices of the Society are kept open the last MONDAY in each month (July 30th), till 9 p.m., to enable persons who are engaged during the day to call and take out certificates *outlining them to participate in the forthcoming advances*. The office hours are from 10 till 4; Saturdays till 2.

Prospectus and stamp must be sent a stamp for a prospectus, or a P.O.O. payable at the General Post-office, when a certificate is sent by return of post.

Subscription, 5s. for every £100 required.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 3, 1877.

NATIONAL COMPETITION DESIGNS,
SOUTH KENSINGTON.

DESIGN is not a strong feature in this year's collection of national competition drawings at Kensington. We remarked last week on the paucity and weakness of the architectural drawings, and suggested the cause of failure. Taking the design for Town Hall, motto "Industria," as an example of the kind of subject placed before the student, we note the extreme redundancy displayed in the over-florid features—there is not a plain sensible window in the whole of the elevations. The windows are, of course, Gothic, with the gabled and crocketed finishings, as if there could not be too many of them. Of course we excuse youthful ambition and love of display, but the whole tendency of the design is towards a false notion of architectural ornamentation; it is like the tyro's prose composition, full of metaphors and expletives without meaning. In looking at the plan we find the offices surround a quadrangular area outside a corridor, and that the public hall and borough court are in the centre—one placed at right angles to the other; the section shows a very ornamental hammer-beam truss, one quite impossible for the span and the height and thinness of the walls of hall. Again the excessive height of the octagonal tower, with Gothic dome and lantern, is out of proportion, while its detail is too tawdry. The faults are all those of a youthful imagination let loose upon a subject far too great for the student who wants to leap before he can run. Among other designs we notice "Tempus," Lincoln, a clever water-colour study of the interior, showing the base of a pillar and some tombs; a design for a decorated fireplace, a jumble of styles with a very rococo-looking superstructure over the mantel-shelf, and with the intimation that it can be executed in "oak or marble;" what facility! a band-stand, by Charles Wilson, Birmingham, cleverly treated in iron, and some studies in decoration. The Westminster St. Mary's school contributes the larger number of the latter. We note the silver medal has been given to a rather unique design for a ceiling conceived in a Japanese spirit. The centre is deep azure, with the orb of night surrounded with stars, and the border is in four panels, filled with folial ornament, in a similar style. The author's name is Walter Dunn. A mosaic floor, by R. D. Green, is a design of some merit, but we do not like the large scrolls; they are unmeaning on a flat surface. Mary Ann Denley sends a chimney-piece, with pointed tiles, light and cheerful-looking. The silver medal is awarded to a design for sgraffito decoration for wall of entrance hall, showing an oak dado, red panels divided by pilasters with white ornament on black ground. But by far the best study in this branch of design is the decoration for a dining-room, marked "Onward," Nottingham. The author shows a strictly conventional and highly artistic design, with a bay recess and settle, and a doorway. The paper-hanging is of a rich neutral olive tint, and the whole of the colour used is low toned; the pattern of the wall partakes of a Japanese character, being covered by a square-linked panel, relieved alternately with square and round medallions in brown with devices. The dado pattern is in a series of upright panels, breaking a continuous folial pattern. The frieze is deep, and relieved by medallions with the stork or some similar bird. The colours are olive grey, puce and gold, and the

whole is a clever work, though only a book prize is awarded it. The designs for iron-work are not remarkable for a study of the material. Charles Edward Wilson, Sheffield, sends an entrance gate in cast iron, heavy in parts, while the bronze medal is bestowed on a Belfast design (Sidney M. Thompson). Bradford sends a chimney-piece in oak, with a huge canopy of antique design. The idea is a misconception; the screens which project from the fireplace on each side and carry the canopy would certainly obstruct the heat from radiating upon the sides of the room. The Westminster St. Mary's school sends a design for a street front intended for a porcelain warehouse. The general outline is not devoid of merit, but the sgraffito panels with black ground do not improve the effect, and the pillars of terra-cotta resting on the cornice of lower window are bad. Lincoln contributes a study in oils of a part of the transepts and cloister of the cathedral—a clever sketch, and with knowledge of detail, but rather heavy in tone. Of other designs we see a poor attempt at a font, the details of which are below par; a sketch for lamp-pillar, Rotherham, not happy; a flower-stand, Birmingham, chaste; a heavily-overeased clock, motto "Line by Line;" and a design for ewer and salver, by the same author, to which a bronze medal has been given, though we prefer the design which has won the book prize, also by the same hand. The silver medal for the enamelled bowl is not well bestowed.

For surface decoration and designs for textile fabrics the work this year is not remarkable, though there are some excellent studies. Kidderminster sends some studies for linoleum, carpets, rugs, tiles, &c.. We like "Nihil sine Labore," and "I do my best." The silver medal design, "Charity," Halifax, is a clever conventionalised design of leaves and fruit on a grey ground for paper hangings—the tints, red, olive, and brown, being low, soft, and harmonious. The blending is happy and varied. Northampton takes a bronze medal for a too bluish and naturalesque treatment, and the flowers are coarse. The book prize awarded to the same school is a well-covered ground with leaves and berries of a light olive tint. Leeds wins a book prize for "Work"—a clever wall-pattern, conventionally arranged. We like, *ab initio*, City and Spitalfields, and Bradford Mechanics' Institute, as good patterns of wall hangings. The latter is a very pleasing arrangement of the daisy type. We note also "Onward," bronze medal pattern, Westminster; "Try on," Wolverhampton—a green ground and leafage.

We generally turn to the lace designs as marvels of handiwork and artistic elegance, and those exhibited this year are by no means behind previous attempts. The gold medal is awarded to a design for Flinders point—Dublin carrying the honour. It is drawn on a black ground, and the pattern is a rich conventionalised one. Birkenhead wins the silver medal. For lace curtains, the gold medal is bestowed on "Onward," who sends by far the best designs. No. 5 is *recherché*—the middle portion being worked with ferns and rich folial borders. "Onward" also obtains the silver medal for a rich lace curtain of a square panelled pattern, thoroughly lace-like. The bronze medal is won by the same hand, also a book prize for a very rich mantilla, and his shawl patterns, and *rotonde*, are unique designs for lace—all showing a masterly knowledge of the material and manufacture.

Among the works of the art-training students, we notice a design for a small mansion by J. A. Kenn, in a Gothic dress, not devoid of architectural merit, but with a wasteful plan, and illustrating the vice

of attempting architectural design without the necessary qualifications in construction. In drawings from the round we find the stock capitals and friezes of the schools of art have been reproduced. Dundee exhibits an Early English capital, well known to all students of the Government schools, and rather a favourite model. We think the Dundee a better copy than the one that has gained the book prize. "Tempus," Lincoln, sends a better drawing in oil than either, though it is without a prize. Edinburgh Male School also goes unrewarded, though the lion's head cymatium is a cleverly shaded copy of the east in oils. A silver medal is taken by Rotherham for a drawing of a Byzantine panel, in which birds are gracefully combined in interlacing foliage. The charcoal studies from the round are as numerous as ever—models from the antique figure being most favoured. The gold medal goes to the Art Training School, Kensington; the Bloomsbury Female School, "Conquiesco," taking the silver medal for a gladiator, in which the muscled are cleverly and boldly shown, with good foreshortening of the advancing portions of the figure. A silver medal is also given to "Set not the Dial by your own Watch," and a bronze medal to the group of wrestlers under the same motto. Of course we have several chalk and oil studies of the torso of Venus, Hercules, the Laocoon, and other models of antique sculpture. The heads in charcoal form an interesting group of studies. Manchester wins the silver medal for a girl's head; Salisbury a book prize for a very expressive girl's face; and Lambeth School a bronze medal for a capital life-rendering of a sailor's head. The silver medal is also given to a sepia drawing from measurement of the north porch of St. Paul's Cathedral to H. P. Watson, Art Training School; and another for a fire-dog, by E. Singer.

To add to our previous notice of the subjects in water-colour, we notice a book-prize piece (Selby)—a clever water-colour sketch of an architectural subject; a silver medal for a group of fruit and tarts; a group of pomegranate and dates, handled with considerable breadth of colouring; "Ars Longa," fruit and metal goblet, with colours well blended, no prize—though it, in our opinion, surpasses "Honori," distinguished by a gold medal. Limerick deservedly takes a prize of books for basket and apples overturned—the blue drapery and the rendering of the apples is quite equal to those awarded the highest prize, and there is a breadth of colouring. "Strive" is the motto of a jar of preserved ginger, onions, and eggs, broadly coloured, and the Edinburgh Female School stands high for its present exhibits. The same may be said of "Onward," Nottingham—a clever group of pine apple, blue vase, and drapery. A lovely group of geraniums (Sheffield) must not be overlooked; while among the oils we cannot leave the exhibition without saying a word for Newcastle-on-Tyne in "Cede Deo"—a well-painted blue Lambeth vase, with a basin of dried leaves against a background of drapery; and, by the same author, a clever sketch in oil of a hedge, in which a "tangled mass" of briar, honeysuckle, and ferns has been charmingly depicted. On the whole we think the provinces have won an honourable place this year.

THE RUBENS EXHIBITION AT
ANTWERP.

WE have received a rough copy of the catalogue of pictures by Rubens, to be collectively exhibited at Antwerp, the city of the great painter's birth. It does not include, of course, those which the Queen has allowed, for the first time, to be photographed; nor does it represent, other-

wise than in shadows, the celebrated Rubens' Gallery in the Louvre, the most perfect illustration of the Flemish artist's genius existing. Still, the exhibition, judging from the imperfect epitome before us, will be one of the deepest interest, as regards both the history of art and the career of the artist himself, and it is curious to note how closely the one was identified with the other. Antwerp is justly proud of her "Sir Peter Paul," whose life was, in its way, a romance. In fact, Antwerp is half made up of him, his house, and his works. But we have now to do with the forthcoming display of his genius at the easel, leaving out of sight his characteristics as a soldier, a scholar, and a statesman. The "School of Antwerp" undoubtedly owes its origin to him, though the title is claimed for earlier artists, who, no doubt, in their generation laboured conscientiously for the furtherance of the fine arts. Who that has visited the "town of the steeple" has not looked over the catalogue of the Antwerp Museum, compiled by the Council of its Royal Academy? A prodigious industry has been bestowed by the Council of the Guild upon the history of the Antwerp painters—the Van-Dycks, of which name no less than twenty-seven sat in the Painters' Chamber; the elder and the younger Teniers; Quintin-Matsys, Durer, Franz Floris, and Martin-de-Vos. But Rubens was the crown of all, as he is the crown now, shortly to be honoured with a new laurel wreath. It was he who infused the spirit of Italy into the Flemish style, and hence his surpassing excellence as the pupil of Romano, Tintoret, and Titian. The impression of one among these masters, at least, is visible in his copies from "The Marriage of Psyche" and "The Fall of the Titans," both, in the original, afterwards attributed to him in hundreds of catalogues. But it was necessary for Antwerp, in order to illustrate, historically and for all the world, the genius of her mighty master, to borrow his canvases wherever they were available. Thus, how could the collection have been complete without the "Rainbow," the "Wood of Laeken," or the "Atalanta and Meleager," from Madrid, all three of which are to be lent; or the "Château of Stein," from the National Gallery, with the "Peace and War" in the same place. The distribution of this painter's works is remarkable. His ghastly "Scourging of Our Saviour" is in Antwerp itself, with the equally terrible "Martyrdom of St. Lieven," but the "Brazen Serpent" is in London, and the "Great Judgment" at Munich, startling every eye by its colossal proportions and furnaces of colour. It will be a singular sight, the gathering in one gallery, for a time, of these wonderful pictures, with the not less marvellous contrasts they present. Thus, the catalogue tells us, that group, most unlike Rubens of all, and yet one of his masterpieces, of "The Virgin being Taught to Read by St. Anna," tenderly imagined and exquisitely painted—a picture with which Antwerp has never parted—will hang by the equally beautiful Magdalen among the "Four Penitents," lent by the King of Bavaria. Then there will be Lord Ashburton's treasure, "The Wolf Hunt," and that singularly misnamed portrait known as the "Chapeau de Paille." The young beauty is not wearing a straw, but a felt hat, and the mistake arose through a confused translation of terms. Again, the mother city of Rubens will borrow from Bavaria his "Seven Boys," and, indeed, there is hardly a town of any position on the Continent which does not possess an original from his hand. We know, at any rate, with what haste and rapidity he worked. Between the ages of nineteen and sixty-two he gave thirteen hundred pictures to the world; he generally worked standing—his hand hardly ever re-

quired the steadying of the maulstick; and, whether these tales, like most others of the kind, be apocryphal or not, he certainly was a master so complete that a thorough illustration of his art-life, such as is proposed at Antwerp, must be of an interest overpassing all common occasions. The catalogue informs us that it will include the "Offering of the Wise Men," containing thirteen figures of more than life size, and said to have been begun and finished in eleven days, will be sent from the Grosvenor Gallery, with copies from his own brush, now in the Pinacothek at Munich; the "Rape of the Sabines" and "The Interposition of the Sabine Women," from Bath House—the last a wonder so long as the art of painting lasts; the portraits of Isabella Brandt and Helena Fairment, and the universally-familiar "Going to Market." From Bleuheim Palace will go the celebrated "Rape of Proserpine." In Antwerp itself will be found the awful picture, usually veiled to strangers, of "The Descent from the Cross," concerning which so furious a controversy raged between the arquebussiers of the ancient Flemish city and the artist himself. But it is imperfectly known what became of the canvases painted by him, and hanging under his own roof, after his bankruptcy, when the entire cabinet was purchased by an agent for George Villiers, Duke of Buckingham, or how far his work was then mixed up with that of Van Dyck, Snyder, or Jordaens, his pupils; so that the critics at the Antwerp Rubens Exhibition will require all their perspicacity to distinguish between the doubtful and the true. Such an exhibition however, is, so far as we are aware, unique, and may well test the connoisseurship of amateurs. No artist has had more copyists—witness his "Prometheus" and "Daniel in the Lion's Den;" no man ever had his name more frequently forged on canvas, whether as "Pietro Paulo Rubens," or "Petrus Paul Rubennis." He complained, in fact, to the English Ambassador that the Prince of Wales had been asked to purchase "a piece scarce touched by his own hand," and it will be an advantage to art-history if the galleries at Antwerp enable competent critics to separate the specious signatures of Peter Paul Rubens from his actual works. The "Holofernes" and the "Hunt of Lions" are, to say the least, dubious; but there can be no question concerning "The Crucifixion of St. Peter," which, being a fixture at Cologne, cannot be sent to Antwerp, though a copy of it will, we are told, be there. If the somewhat disjointed preface to the catalogue, indeed, be justified in its promises, we shall have the scarcely-known illustrations of the "Æneid" from Mantua, the studies after Titian and Veronese from Venice, the portrait of Philip III. from Madrid, the "Circumcision" and "St. Ignatius Working a Miracle" from Genoa, and so forth; but there are some of his masterpieces which cannot be mustered for show—those in the Gallery of the Luxembourg, in the Convent of the Carmelites in the Spanish town of Loeches, in the grand saloon of the Royal Palace at Madrid, the ceiling of the Banqueting House at Whitehall, the "Bath of Diana," the "Rescue of Perseus by Andromeda," the "Rape of Helen," the "Judgment of Paris," "Venus and Minerva," and the "Triumph of Bacchus." It is not to be expected, moreover, that the British Museum will lend its specimens, or, at all events, more than fac-similes of them, to the Exhibition at Antwerp. They were purchased at the Buckingham sale, in 1834, and form a cabinet of examples in niello altogether incomparable, all traceable to the Rubens school, if not to the master's own hand; nor is it to be expected that the former *chef d'œuvre* of the Penrice collection, "The Judgment of Paris," will, to employ a popular term,

put in an appearance; neither the "Book of Costumes," also at Bloomsbury, though promises are made from Stafford and Devonshire Houses, and particularly from Hertford House, where hangs that superb work, "Christ Giving the Keys to Peter," painted in the very meridian of the master's power for the Cathedral of St. Gudule, at Brussels, besides a "Holy Family," which Lord Hertford shows himself liberal enough in allowing to cross the seas. Contributions too, we perceive, are to be made from the Holford, Breadalbane, Apsley House, and Coleridge collections, and, as already noticed, Windsor Castle, where "The Rubens Room" is a perfect treasure-house of art. Thence, however, only photographs will go to Antwerp:—Rubens' portrait of his second wife; "St. Martin Dividing his Coat with a Beggar," "The Virgin supporting the Infant Christ," "King Philip IV. of Spain on Horseback," the artist's own portrait, a winter landscape, other landscapes, other portraits, and so on; with none of which the public have hitherto been familiarised, even through the medium of engraving. It is almost astonishing, however, to note through what labyrinths the art-hunter must pursue his game if he be really intent on gathering a real Rubens' cabinet to exhibit, if only for a limited time. He is sent from Stanstead House to Arundel Castle, thence to Oxford; from Oxford to Winchester and Salisbury; through Bath, Birmingham, and Edinburgh, to York, Chatsworth, and Alton Towers: for Rubens is ubiquitous, his pencil is everywhere; and the audacious idea of the day is to concentrate his genius, as it were, in a focus. So far for England. Upon the Continent the dispersion of the Rubens' canvases has been far wider, notwithstanding the great galleries at Paris, Dusseldorf, and the Hague, from the two latter of which, however, loans, it is stated, have been guaranteed, together with Brussels, Amsterdam, and Bruges. If, collectively, they cannot furnish magnificently a limited space of wall for a few months, it will not be the reputation of Rubens that will suffer. Of course we have not by any means exhausted the account of the distribution of the master's works in England; but the gathering of them at Antwerp from various cities and galleries of the Continent must be still more remarkable—from St. Walpurg, in the antique Flemish city itself; Brussels, Berlin, St. Petersburg—where in the Palace of the Hermitage the "Adoration of the Magi" occupies a room, lined with jasper and chalcidony, by itself; the "Ascension," at Mechlin; the "Jouas Cast into the Sea," at Mechlin also; and the "Marriage of St. Catherine," a marvel of grouping and colour, at Frankfort; though a fine copy of it is to be seen in the Duke of Rutland's cabinet at Belvoir Castle. There are others, however, which will not be allowed to leave the hands of their actual owners, even for an hour. "The Descent from the Cross," at Lièves; the "Adoration of the Magi," at Paris—at least it is not enumerated in the catalogue; and the "Christ brought before Caiaphas," little known to the world, except through the brilliant engravings of Gaspar Huberti. To Antwerp, moreover, has gone back again, we are told, after a curious history, the "Christ's Charge to Peter," a work glowing with the highest genius of the artist, sold by auction over and over again, never commanding a price equivalent to its value, and often disparagingly compared with a replica possessed by the Prince of Orange. We may look out, then, for a Rubens controversy upon the most fiery scale, and, as the French catalogue says, "the picture will now be brought into court; its judges are the public, to whom it confidently appeals, and it prays that a verdict of acquittal may be recorded against those who have conspired against its cha-

acter and fame." The jury this time will sit at Antwerp; whither also are to be sent, from Munich, "The Martyrdom of St. Lawrence," "Job," tormented by three demons; "Job," seated on a dunghill, and enduring the bitter reproaches of his wife; another "Adoration of the Magi," from the museum at Brussels, with a "Procession to Calvary," hung on the same walls, and the "Adoration of the Shepherds," from Bree-street, Amsterdam. Thus far-scattered are the relics of Rubens. The catalogue points to his "Diogenes seeking for an Honest Man" as from the Louvre. This is incorrect, or, as the French themselves say, "inexact." The picture at the Louvre is a copy; the original is at Munich; but both will come, together with a host of others, from the unsurpassed Bavarian galleries. "The Assumption," "The Adoration of the Shepherds," "The Reconciliation between the Romans and Sabines," "St. Michael overthrowing the Great Dragon," "The Ruin of Sennacherib and his Host," "The Descent of the Holy Ghost," the "Silenus and Satyrs," and so forth. Indeed, except for the accident of its being his birthplace, and easy of access from all quarters of Europe, we might rather wonder why Antwerp and not Munich was selected as the locality of the forthcoming Rubens Exhibition; for, indubitably, his principal illustrations are there; but, it may be supposed, the old house on the Scheldt, in the Flemish city, where the artist was born, and where Quentin Matsys wielded his hammer, has its charm. From the Luxembourg, it is to be feared, few contributions will be obtained. They consist principally of sketched episodes in the life of Marie de Medici—her education, her marriage, her embarkation, coronation, government, flight, and ultimate fate. From Dresden, again, the catalogue assures us, will be volunteered some of Rubens' most characteristic portraits, actual and ideal: of a gentleman, of a lady, of the Magdalen, of the artist's children, and of sundry queens. Vienna, too, with Hesse-Cassel and the old Lichtenstein gallery, with the Escorial itself, Sans-Souci, Frankfort, and that mystic personage, "the Landgrave of Fürstenburg," will add their riches to the Rubens triumph, besides Brunswick, Vienna, and the palaces of Genoa. In truth, there is scarcely a corner of Europe wherein we do not find that the hand of the magnificent Antwerp master has been busy; and well, therefore, may Antwerp celebrate his festival, by displaying as his monument a collection of his works. It was a happy idea, only marred by the impossibility of its being carried out in its entirety. But, notwithstanding this drawback, which the promoters of the exhibition must have anticipated, the catalogue already printed, defective though it be, promises us a splendid chapter in the history of Flemish art.

EARLY CHRISTIAN ARCHITECTURE. No. XI.

WE present our readers to-day with one of the most unique examples of ancient planning to be found of the earlier ages of the Christian Church. It is the plan of the Church of San Lorenzo Maggiore, at Milan, with its dependent chapels—a building resembling in its main features the celebrated structure at Ravenna, known as the Church of St. Vitale. It was once the Cathedral of Milan, and it is supposed to have been built before the time of Justinian; Hübsch thinks the foundation belongs to the fourth century, and the structure has undergone various transformations since it was destroyed by fire in 1071. The church, indeed, may be regarded as a further development of San Vitale, and another step towards the solution of

the problem of covering a square with the dome, which the Byzantine architects ultimately achieved. It will be observed, on referring to the plan, that the square, octagon, and circle are all combined in a remarkably ingenious manner—the four alternate sides of the octagon forming segmental apses, with an outer ambulatory. The present dome is octagonal, 78ft. in diameter, and the internal diameter of the building is stated to be 150ft. Referring to the plan of M. Hübsch we find an atrium, with colonnade in front; while at the east there is an octagonal building, thought by Mr. Fergusson to be a tomb-house, but called by Hübsch the Chapel of St. Hippolytus. On the north side is another, though smaller, octagon apartment, named the Chapel of St. Sixtus; and on the south side a still larger structure dedicated to St. Aquila. The aggregate of structures was never accurately delineated till Hübsch undertook the task, and we therefore translate his remarks:—"This celebrated work (subordinate to which are the chapels of St. Hippolytus, St. Sixtus, and St. Aquila, of almost equal antiquity) has neither been thoroughly examined nor accurately represented hitherto. Nevertheless, even setting aside its magnificent structural dimensions, it throws most valuable light on Early Christian architecture. The octagonal dome which surmounts the principal enclosure is no less than 78ft. in diameter, and from the floor to the crown, it was 127ft. in height. The internal diameter of the building is 150ft. During the last six years, I have made repeated examinations of this edifice, and have frequently compared it with other monuments of a similar kind, notably those at Ravenna, and with descriptions of ancient historians. I may consequently, fairly claim exactness in the plans [reproduced by us], wherein I have endeavoured to show what was evidently the original form of the building. The original walls are concealed by numerous chapels of later date, indicated by dotted lines in the plan (Fig. 11). The existing cupola and most of the more prominent parts are chiefly of modern construction, though it is not very difficult to point out where departures have been made from the original details. The external walls are preserved, and the principal pillars of the interior up to a considerable height. The brick masonry is constructed with so much care that archaeologists have fancied it to be a classic Roman work. The original cupola fell in suddenly in 1573. The archbishop of the time, St. Charles Borromeo, gave orders to Martin Bassi to rebuild it, and the work was completed in 1591. The architect, in order to reassure the church authorities, and to prove that the eight pillars were sufficient to support the cupola, notwithstanding their small diameter, wrote a treatise on the subject, wherein he mentions the cause of the accident, and describes the ancient cupola with the arches and the semi-cupolas surmounting apses. As will be seen, the primitive plan, which is of great originality (see Fig. 1), was followed in the rebuilding. The central space, covered by an octagonal cupola, forms a perfect square, bounded by twelve large pillars, with four apses or exedrae. It is the Greek cross, with arms short and rounded, surrounded by a vast ambulatory or aisle of equal breadth, so that the form of the interior, that of a Greek cross, is reproduced externally. The aisle is divided into two stories, as shown in Fig. 5, and reminds one exactly of that of St. Vitale, at Ravenna, which remains in its original form. At St. Vitale may be seen in the façades the same ribs with this difference, that St. Vitale is polygonal, whilst the outer walls of San Lorenzo are in segments of circles, and approach the apse form of the most ancient churches of Rome. In front of the principal façade there was a

porch of three entrances, and which, judging by some remains, was vaulted." Such is the general description given us by Hübsch of this splendid domical church. The same authority rather seems to think the porch extended and formed an immense atrium. He also infers that the altar was placed in the centre, as at St. Stephen the Round, at Rome, which we shall describe further on.

The plans, which we publish from the authentic work of Hübsch, show by the relative shadings of the walls, the main parts of the structure. M. Hübsch, in his elaborate description of this edifice, gives us a section of the structure carefully taken from measurement. The base of dome is gathered into a regular octagon by a series of five enlarging arches, or species of squinch, shown by the dotted lines in our plan, and from these the dome springs. It is of a pointed section, pierced below by a series of circular-headed windows, two in each side, just above the roof of the circular aisle. The four apses, or segmental colonnades, on the alternate sides have octagonal columns below marked *h* (Fig. 1) supporting an arcade of three round arches in each apse, the capitals to which are bevelled at the angles converting the octagon to a square under the abacus. Above, in the gallery plan (Fig. 5), the circular arcades are subdivided, forming in each apse an arcade of six arches. The shafts to these are round, and have a species of Ionic capital. From these circular arcades or screens spring semi-domes decorated with figures in mosaic, which abut against the alternate sides of the inner octagon. The outer aisles, both on the ground and gallery floors, are groined, as will be noticed by the dotted lines in plan. The great arches supporting the dome are also circular, the archivolts being canted—that is to say, their soffits are bevelled to agree with the canted piers noticed in plan, and which coincide with the segments. These piers are panelled with marble, and the arch soffits have a kind of guilloche on them. The four squares which protrude at the junction of the lateral apses are angular towers terminating at the base of dome. The dome has a small octagonal lantern, and is roofed by a flat roof of timber, the walls of the drum being carried up above the dome, and pierced by openings above its extradosal surface. Turning to the smaller lateral structures the chapel of St. Hippolytus or tomb (marked 4 on plan) is groined in the centre by the introduction of two circular vaults—the four lateral arms being also arched at the same level. Hübsch shows a flat-pitched roof over—the angle columns are Corinthian in character. The smaller northern structure (3), Chapel of St. Sixtus, is a simple dome, octagon on plan, with similar lateral recesses arched below the dome. The larger structure of St. Aquila on the south side, marked 2 on plan, is a repetition of the last, though on a larger scale—45ft. in diameter—and with a row of circular apertures round the base of dome, with an upper arcading round the springing, above which is a flat roof and lantern so characteristic of the Pisan or Romanesque style, the external angles being relieved by slight projecting pilasters divided into three stages by string courses. The connecting vestibule is of two stories, the upper one vaulted. In the upper plan, Fig. 6, the triforium or gallery round the dome of the octagonal structure, or church of St. Aquila, is seen, and this is formed in the thickness of the wall. The second stage is illustrated by a half plan, taken at the level of the upper arcade (see Fig. 8).

These constructions are chiefly interesting to us as examples of the development of the dome, which reached its acme in Sta. Sophia in the reign of Justinian, and the

general features of which we described and illustrated in our last volume. The angles or towers of San Lorenzo supplied the office of counteracting buttresses to the thrust of the great arches carrying the dome, but the use of the pendentive had not been fully developed. In the smaller chapels the dome is seen to spring from a solid wall or substructure, which was pierced laterally, giving all the advantage of area with deep counterforts. In the plans of the four structures, indeed, we trace the successive steps of a problem which the Byzantine architects worked out with astonishing vigour and beauty. The details also of this example are specially interesting. The arches are composed of bricks of the usual long shape; the cornices are simple projecting courses of bricks, relieved in the lower courses by plain brick dentils, and the whole effect is the result of singularly vigorous forms, plain surfaces, and vertical brick piers at the angles. Of the other illustrations, Fig. 12 is the plan of the sepulchral church of Galla Placidia, Ravenna, now known as the church of SS. Nazario and Celso, constructed between the years 420 and 450. The three arms form chambers for three sarcophagi. Its polychromatic decorations are still perfect. The other plans we shall describe in our next.

THE COST OF THE MANCHESTER TOWN HALL AND ITS PROPOSED MURAL DECORATIONS.

AT the monthly meeting of the General Purposes Committee of the Manchester City Council last week, the following report by Mr. Waterhouse was considered:—"As requested by the committee at the last meeting, I have made a careful calculation of the amounts which are due or will become due to the various contractors on the building. The total amount of the various certificates I have already granted appears to be £149,179 19s. 7d.; and, as nearly as it is possible to judge, a sum of £29,500 will cover the various outstanding claims. From this latter amount, however, may be deducted the sum of £2,155 which I understand has been paid to M. Cavaille-Coll, for which I have given no certificate. The sums I have mentioned are inclusive of furniture, decorations, organ, bells, clock, machinery, and all other matters coming within my cognisance. In this connection I wish to remark that I have observed in the report of the proceedings of the last meeting of the General Purposes Committee that some uncertainty appears to exist as to what may be due to me with regard to certain portions of the work, and especially with regard to the proposed mural paintings. As to this latter point, I beg to remind the committee that I have already distinctly volunteered to do all that lay in my power in connection with this matter without any pecuniary remuneration whatever. I have from to time urged the carrying out of this scheme solely from a conviction that I so strongly feel that the building furnishes a great opportunity for pictorial embellishment of the highest order. I do not wish to refer at length to what I have done in the matter, but you are aware that I have paid two visits to the Continent in pursuing my investigations on the subject, that I have sought and obtained interviews with a great number of artists and others, and that I have presented to the Decorations Sub-committee many and voluminous reports. For my trouble, however, I shall feel myself amply rewarded when the scheme shall have been brought to a successful issue. It may not be out of place, perhaps, to state on this occasion that when the time shall come for me to present my bill for professional services in connection with the new Town Hall, it will be my duty to divide my charges under two respective headings—one relating to the structure of the building, with the fittings and furniture designed by me, and the other relating to the works which have been carried out more or less under my superintendence, and which involve on my part negotiations,

and the choosing or revision of other persons' designs. In the latter category will be included the organ, the clock, the bells, the upholstery, and some portion of the decorations. For these works my charge will be 2½ per cent., and for the general works my fee will be, as was arranged, the usual one of 5 per cent. After the remarks which have been made in the General Purposes Committee, I feel that it is as much a duty to your committee as to myself that there should be a clear understanding in this matter."

THE SEVERN TUNNEL.

THE conclusion of the meetings of the Institution of Mechanical Engineers, at Bristol, was marked on Thursday in last week by a visit to the Severn Tunnel Works, by invitation of the Great Western Railway Company, who acted as hosts in an excellent manner. On arriving at Portskewet the party—who numbered about 140, and included the President (Mr. Hawkesley) and other prominent members of the Institution—were met by Mr. J. J. Geach and Mr. A. Gooch, the resident engineers, and were conducted by these gentlemen over the surface works of the undertaking, there not being sufficient time to go underground. One of the most interesting features of the visit was the exhibition of Mr. Geach's specially designed rock drill at work. Pieces of stone of the same character as those encountered in the tunnel were placed on a bench and pierced by one of the drills worked by the air-driving machine. Compressed air at a tension of 60lb. to the square inch was used, and the drill made 600 to 700 strokes per minute, rapidly forming a 1½in. hole through the section of rock. The average speed of boring was stated to be 9ft. per 24 hours, but under favourable circumstances 13ft. has been pierced. With this drill 1,500 yards have been bored through in the heading, the total distance to be got through being about 2 miles. This heading will be subsequently enlarged, and form part of the tunnel proper. The air compressors by which the drill is driven, and the workings ventilated were also shown. The powerful pumping engines, capable of throwing 100,000 gallons per hour, were seen at work. The visitors then inspected a new permanent shaft in course of construction, fitted with a pump capable of throwing 150,000gals. per hour a height of 180ft. In the course of conversation at the tunnel the opinion was generally expressed that the undertaking, if completed, will prove a great advantage to the trade of Bristol, and give a powerful impetus to the long-talked-of project for a Channel tunnel.

The members, after a full inspection of the Tunnel works, reassembled on board the special steamer, and after a cruise past Clevedon, were landed at Portishead and viewed the docks, now nearly completed, Mr. Barbenson (resident engineer) and Mr. Daniel (contractor) pointing out the principal features. The party re-embarked and proceeded to the recently-opened Avonmouth Docks, where they were met by Mr. H. Dalrymple (managing director), Mr. Brunles (engineer of the dock), Mr. J. Abernethy (engineer, Alexandra Dock), and Mr. J. B. Mackenzie (resident engineer, Avonmouth Dock), and examined the docks, especially noting the hydraulic machinery. On Friday the members visited the Great Western works, at Swindon, the company again being their entertainers.

MR. RUSKIN ON CHURCH RESTORATION AT BEWDLEY.

THE letter of Mr. Ruskin, quoted below, appears in the *Kidderminster Times* of Saturday, in reference to the "restoration" of Ribbesford Church, near Bewdley. The church has become so dilapidated from age that it is thought dangerous to continue the services there, and this has led to the question of a restoration being mooted. Plans have been prepared by Mr. Preedy, architect, of London, and it is estimated that £2,500 would be required to carry them out. The Rev. Mr. Ingham, the rector, has received promises of nearly £1,000, and the provisional committee appointed recently will, we believe, recommend

to the vestry the adoption, in substance, of Mr. Preedy's plans. The "Archer Knight," mentioned by Mr. Ruskin, is represented killing a salmon and a deer with one shaft, and this is supposed to refer to the abundance of game in the neighbourhood in bygone times. Ribbesford formerly belonged to the church at Worcester, and the subjects of the manor were required to furnish weirs for taking fish, and appointments for hunting as well. Mr. Ruskin's letter is as follows:—

"Brantwood, Coniston, Lancashire, July 24, 1877.

"Sir,—It chanced that on the morning of the Sunday when the appearance of danger in the walls of Ribbesford Church began seriously to manifest themselves (according to the report in your columns of the 21st inst.), I was standing outside of the church, listening to the singing of the last hymn as the sound came through the open door (with the Archer Knight sculptured above it), and showing to the friend who had brought me to the lovely place the extreme interest of the old perpendicular traceries in the freehand working of their apertures.

"Permit me to say, with reference to the proposed restoration of the church, that no modern architect, no mason, either can, or would if they could, 'copy' those traceries. They will assuredly put up vile geometrical models in their place, which will be no more like the old traceries than a Kensington paper pattern is like a living flower. Whatever else is added or removed, those traceries should be replaced as they are, and left in reverence until they moulder away. If they are already too much decayed to hold the glass safely (which I do not believe), any framework which may be necessary can be arranged to hold the casements within them, leaving their bars entirely disengaged, and merely kept from falling by iron supports. But if those are to be 'copied,' why in the world cannot the congregation pay for a new and original church, to display the genius and the wealth of the nineteenth century somewhere else, and leave the dear old ruin to grow grey by Severn side in peace?—I am, sir, your faithful servant,

"JOHN RUSKIN."

THE APPROACHING ANNUAL MEETINGS OF THE ARCHÆOLOGICAL SOCIETIES.

THE annual Congress of the Royal Archæological Institute will this year be held at Hereford, under the presidency of the Bishop of that city. The following are the presidents of sections:—

ANTIQUITIES.—President, Sir William Guise, Bart., President of the Bristol and Gloucestershire Archæological Society; Vice-President, Rev. H. M. Scarth, M.A., Hon. Canon of Wells.

HISTORY.—President, A. J. Beresford Hope, Esq., M.P., D.C.L., LL.D.; Vice-President, Rev. John Jebb, D.D., Canon of Hereford.

ARCHITECTURE.—President, J. Gambier-Parry, Esq.; Vice-President, J. H. Parker, Esq., C.B.

The meeting will commence on Tuesday next, and the general programme is as follows:—

TUESDAY, August 7.—Reception by the Town Council. In the afternoon to visit the Cathedral, an historical description of the fabric of which will be given by Sir Gilbert Scott.

WEDNESDAY, August 8.—Railway Excursion to Ludlow and Leominster Churches, &c. The churches will be described by Sir Gilbert Scott, and Ludlow Castle by Mr. G. T. Clark.

THURSDAY, August 9.—Annual Meeting of the Institute; afterwards visit to the City Antiquities. In the afternoon, Excursion to Sutton Walls and Marden Church, via Holmer, Pipe, and Moreton-on-Lugg, and return via Sutton.

FRIDAY, August 10.—Excursion through Haywood Forest, to Kilpeck Church and Castle; thence to Kenderchurch, Ewyas Harold Castle Church, and Abbey Dore Church, to Whitfield, where the party will be received by the Rev. A. Clive; thence to Madley Church, and home by Clehonger and Belmont Priory. Mr. G. T. Clark will, on the sites, lecture on the Castles of Kilpeck and Ewyas Harold.

SATURDAY, August 11.—Railway Excursion to Ross, Goodrich Castle, and Flanesford Priory.

MONDAY, August 13.—Excursion to Kenchester (Magna Castra), thence along Roman-road, crossing Offa's Dyke, through Garmon's-park, to Byford Church, Monnington Church, and Moccas, over Moccas bridge, thence to Bredwardine Church; returning over Bredwardine-bridge, via Staunton-on-Wye and Norton Canon, through Foxley Grounds, to Mansell Lacy, Briansop, and Credenhill Church and Camp.

TUESDAY, August 14.—Left open for Tewkesbury Abbey, &c., on invitation from the Worcester Diocesan Architectural and Archæological Society, who hope to arrange an excursion to Tewkesbury for this day, particulars of which will be duly announced.

The temporary museum of the Institute will be formed in the museum at the Free Library, under

the direction of the Rev. F. T. Havergal and Mr. J. T. Owen Fowler, by whom objects for exhibition will be received.

Further information as to tickets, &c., will be found in our advertising columns.

The British Archaeological Association have selected Llangollen as their starting point, and the following is their programme:—

MONDAY, August 27th.—Opening meeting at the County Hall, Llangollen, at 5.30 p.m. Members and visitors will then be conducted to Plas Newydd, formerly the residence of the "Ladies of Llangollen." Public dinner in Assembly-room. Inaugural speeches, &c.

TUESDAY.—Visit at 9.30 a.m. to the Castell Dinas Bran, and the ruins. Leave Llangollen at 12.30 p.m., arriving at Wrexham at 1.5 p.m., when the church will be described by Mr. B. Ferrey, F.S.A. Luncheon at Wrexham. Afterwards to Gresford Church, &c., and return to Wrexham for the 6.25 p.m. train, arriving at Llangollen at 7 p.m. for evening meeting.

WEDNESDAY.—Leave Llangollen at 10 a.m. in carriages for inspection of Offa's Dyke, which will be explained by Mr. J. Tom Burgess, F.S.A., then to visit Chirk Castle. Luncheon at Chirk, and then in carriages, by Pont Cysylltu, to visit Valle Crucis Abbey, and Elisig's Pillar. The abbey will be described by Mr. Loftus Brock, F.S.A., and others. Mr. Bloxam, F.S.A., will give the history of Elisig's Pillar. Return to Llangollen. Evening meeting at 8.30.

THURSDAY.—Leave in carriages at 10 a.m., and visit the site of Owen Glendower's House (Sychant), Mound, and Farm, on which Mr. George R. Wright, F.S.A., will make some observations, and then on to Corwen Church, Rûg Chapel, which will be described by the Rev. W. Richardson, B.A. Ascent of the Gaer, an ancient British encampment. Afterwards luncheon at Corwen. Return to Llangollen for evening meeting.

FRIDAY.—By special train to Dolgelly, at 8.45 a.m., for a visit to the remains of Cymer Abbey, Abbot's House, &c., which will be commented on by Messrs. Wynne, John Reynolds, Loftus Brock, and others. Luncheon at the Golden Lion Hotel, Dolgelly. At 2 p.m. by special train to Bala; and there carriages will convey them to the ancient Manor House of Rhiwaeod, which will be described; then to Palé, the seat of Mr. Robertson, M.P., and Llanderfel Church. Special train to leave Llanderfel at 6.30, arriving at Llangollen for evening meeting.

SATURDAY, Sept. 1.—VALE OF CLWYD.—Leave by train at 9.50 a.m. for Llanhaiadr, via Corwen. On arrival at the station, carriages will be in readiness to convey the members and visitors to the church, and then on to Denbigh, for luncheon at the Town Hall. The castle will afterwards be visited and described, and the party will leave by train for Derwen Church. Leave Derwen by special train at 6.35, arriving at Llangollen for the evening meeting.

MONDAY.—Leave by train to Mostyn at 9 a.m. for the examination of library, &c., at Mostyn Hall, afterwards it is proposed to visit the remains of Basingwerk Abbey and the Holy Well of St. Winifred, and return to Llangollen in time for the closing meeting and reading of papers.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

MIDLAND INSTITUTE.—The members of the archaeological section of the Midland Institute had their last walking excursion for the present summer on Saturday. Leaving the Great Western Railway at Kingswood, the party set out to walk to the 15th century mansion at Baddesley Clinton. They were met at the gateway by the owner, Mr. Marmion Edward Ferrers, who conducted them over the house. On leaving the house, Mr. Ferrers conducted the party to Baddesley Church, where he pointed out the portions of the building of chief interest. From these along some well-wooded roads, and through fields skirting the well-known Hay Wood, the party made their way to Wroxall Abbey and Church. Mr. Everitt read a description, taken from "Churches of Warwickshire," of this interesting 14th century building, once the conventual church of the then adjoining abbey. On leaving the church the members were allowed to visit the remains of the abbey buildings. The members next made their way to Rowington, paying a hasty visit on the road to the picturesque half-timbered house, known as the Shakespeare House, where they were kindly received. After tea at the Elephant and Castle Inn, they visited the church, where the vicar received them. After a stroll through the vicarage gardens, the members returned to Kingswood Station, and reached Birmingham about ten o'clock.

SUSSEX ARCHÆOLOGICAL SOCIETY.—The annual general meeting of the Sussex Archaeological Society has been arranged for Thursday next, the 9th inst., when Horsham is to be visited. The members will assemble at the Town Hall at noon, and after the business meeting the temporary loan museum to be arranged in the Town Hall will be examined, and the church of St. Mary will be visited. After a public dinner it is proposed to proceed to Chesworth, and, if time permit, to Sedgwick, where the remains of the ancient castle are to be examined.

THE NORTH STAFFORDSHIRE ARCHÆOLOGICAL SOCIETY.—The fourth excursion of the present season in connection with the above society took place on Saturday week, under the conduct of Mr. A. Scrivener. The day's programme consisted of a visit to Tamworth, Seckington (Warwickshire), and Clifton Campville. Arriving at the former place by the 9.45 train, the party at once proceeded *en voiture* to Seckington, the Saxon *Seccondum*. At this village, which is situated in the midst of a beautifully wooded country, an early defensive earthwork was visited. The church, dedicated to All Saints, was the next object visited. Among the points of interest in the interior are the remains of an old carved oak screen, and in the north wall of the nave the recumbent effigy of a lady murdered by her husband, who afterwards founded the Abbey of Alvecothe in expiation of his crime. The south wall of the chancel contains, close to the floor, a leper's window. At Clifton Campville, which was next visited, the church consists of a western tower and spire, nave with south aisle, north chapel with parvise, and chancel with south aisle or chapel. The oldest portions—part of the north walling of the nave and chancel—are said to be of early 13th-century work. The north chapel is more modern, being of later 13th-century work. The rest of the edifice generally is of the 14th century. The other objects of interest are some old screens, a row of "misereres," and an altar tomb in the south chapel, date 1545; also several monuments to members of the Pye family in the chancel, one of which is the work of the celebrated Rysbrach. The register, which is in a ruinous state, dates from 1594. Here the party partook of luncheon. Another delightful drive brought the sight-seers to Tamworth, where the church was again the object of attraction. Here the rector (the Rev. Brooke Lambert) kindly exhibited the registers, which are very curious, dating from 1556. Mr. Scrivener then described the church, giving a sketch of its earlier history. It seems probable that the cross which stood close by was the first preaching place, and that the present church occupies, or nearly occupies, the site of the first (Saxon) church. The latter, doubtless destroyed by the Danes when the town was burnt in the 9th century, was rebuilt by Ethelfleda, King Alfred's daughter, in the following century. In the same century Edgar re-founded the church and gave it a college of canons, and Edith being canonized, established a convent at the old castle, which was afterwards removed to Polesworth. The festival of canonization was celebrated annually, and is supposed to be the origin of the fair still held in July. The church consists of nave, north and south aisles, western tower, remains of central tower, transepts, chancel, south chapels or sacristies, crypt, north chapel of St. George, and north porch. What remains of the edifice prior to the fire of 1345 indicates that it once possessed great magnificence. The principal part of the church, except the clerestories and north chapel, belongs to various times of the 14th century. The clerestory windows, added early in the reign of Henry VIII., contain glass representing the history of the connection between the church and the castle. There are several tombs of great interest under arches in the north wall of the chancel; one to Sir John Ferrers, another probably to Lady Jane de Freville, and a third to Sir Baldwin de Freville and Lady (1400). Besides these monuments, there is a recumbent effigy under an arch in the north wall of the north chapel, apparently of a secular canon, with cassock, surplice, tippet, with long lappets in front, and hood, presumably Baldwin de Whitney, dean of Tamworth in 1369. From the church the party proceeded to the castle, which was thrown open

to the members by Mr. T. Cooke. Given to Robert de Marmion by William the Conqueror, it passed to the Frevilles, and afterwards to the Marquis Townshend, the present owner. The party afterwards dined at the Castle Hotel.

COMPETITIONS.

BIRMINGHAM.—The Midland Land Corporation, having offered three premiums of one hundred and fifty guineas, one hundred guineas, and fifty guineas, for the three best designs for laying out for building purposes the West Combe Park Estate, Blackheath, Kent, seventy-two drawings have been sent in, and have been open to public inspection at the Masonic Hall, New-street, Birmingham, during the week.

COMPETITION FOR CEMETERY CHAPEL.—NOTTINGHAM CHURCH CEMETERY COMPANY.—There were 39 sets of drawings in this competition. Mr. Fowler, architect, of Durham, was appointed by the committee to adjudicate upon the designs. He has reported in favour of the designs by the following gentlemen, in the order of merit as placed below:—1. Design marked with a black Maltese cross, Mr. E. W. Godwin, F.S.A., 8, Victoria-chambers, Westminster. 2. Design marked "Black and White," Mr. Richard Charles Page, 18, Buckingham-street, London. 3. Design marked "Economy," Mr. Albert Lowenthal, 10, Adelphi-terrace, Strand, London. The premiated designs have been publicly exhibited in the Art Museum, Exchange-rooms, Nottingham. It is understood that a meeting of the committee will be held on August 9, after which an official report upon the matter will probably be made.

KENSINGTON.—On Wednesday the Kensington Vestry met to inspect and decide upon the plans for the new Vestry Hall, when the designs were hung round the room for examination. The report of the joint committee was read, from which it appeared that the committee regretted they could not agree with the selection of the professional adviser, and recommended as follows:—"Experientia," 1; "Expert," 2; "Experience," 3; and "Cavendo Tutus," 4 in merit. From the statement of Mr. Lewin it seems that eleven of the committee thought "Experience" the best, and he considered it should stand first, and moved an amendment to that effect, which was seconded by Mr. Shapcott. Mr. Freeman argued that the design "Experientia" was distinctly voted as the best. He objected to the Queen Anne style, which the professional adviser had a fancy for, on the ground that we had enough of it in the School Board buildings. He also contended that they could not adopt the elevation of "Experience," but that "Experientia" was without a rival, making the remark that they "should refer the matter to the committee to consider what plan should go behind the elevation of 'Experientia.'" Mr. Saunders objected to "Experientia" as not among those selected by the referee, but it was stated that the committee intended to call upon the authors to show that their designs could be executed for the amount. After the reply of Major-General Boileau, the report was adopted with only one dissentient. By an inadvertent transposition last week in our report of the award of the referee, the design of Mr. J. J. Stevenson, marked "Old Kensington," was accredited to Mr. John O. Scott. It should have been "Kensington," John O. Scott; "Old Kensington," J. J. Stevenson—the last being placed second, and the former third, by Mr. Whichcord. The estimated costs which we gave were those quoted in the report of the referee as his own.

A new Board school was opened at Ladybarn Greenock, on Saturday. It accommodates 312 scholars, and has been built from designs by Mr. Mercer, architect, at a cost of £22,400—a little over £7 per head.

The sanitary committee of Warrenpoint, near Newry, have requested Messrs. Mayne and Atkinson to report whether a water carriage or dry system of sewage disposal would be best suited to the requirements of the district.

A working men's institute is being built at Charmingston, Dorset, by Mr. Cooper, contractor, from plans by Mr. Miles.

PROPOSED MORTUARY CHAPEL AT NOTTINGHAM—NEW ROMAN CATHOLIC CHURCH AT KILMALLOCK—"BUILDING NEWS" CLUB DESIGNS FOR LODGE AND GATE ENTRANCE—KENSINGTON VICARAGE—EARLY CHRISTIAN ARCHITECTURE—CHURCHES OF ST. DIONIS BACK CHURCH, AND ALLHALLOWS, BREAD-STREET.

OUR LITHOGRAPHIC ILLUSTRATIONS.

TWO CONDEMNED CITY CHURCHES: ST. DIONIS BACK CHURCH, FENCHURCH-STREET—THE CHURCH OF ALLHALLOWS, BREAD-STREET, CITY.

THESE drawings are of interest just now, as they represent the first two of the condemned City churches to be demolished:—

The Church of St. Dionis has its east front in Lime-street and south side towards Fenchurch-street, though the latter is almost hidden by a range of low buildings, fronting upon Fenchurch-street. The present building is the third church dedicated to St. Dionis, or, rather, St. Dionysius, which has stood upon this site. When the original church was erected is unknown, but it is mentioned as early as the 13th century. This gave place, at the commencement of the 15th century, to a new building, which seems to have been of considerable importance, till it was destroyed in the Great Fire of London, in 1666. The present building was finished (with the exception of the tower) in 1674, from the designs of Sir Christopher Wren. The tower (erected in 1684) stands at the south-west corner of the church, and was originally surmounted by a small turret, which was removed about 50 years since. It will be remembered that this is the tower Mr. Street is said to have proposed to Gothicise.—J. F. S.

Respecting the general appearance of the building which preceded the present church of Allhallows, Bread-street, now, in its turn, about to be demolished to make room for business premises, nothing is known; but, on referring to Godwin and Britton's "Churches of London," we find mention made of such a building occupying this site as early as the year 1349. After the burning of this place of worship in the Great Fire of 1666 no steps seem to have been taken by the parishioners to supply its place till in 1680, under the superintendence, and from the designs of Sir C. Wren, the present edifice arose. The cost of this new building was £3,348 7s. 2d., part of which sum (£600) was raised by a tax on coals (levied for the purpose of erecting new churches in the City), and the remainder obtained by loans. In the vestry-room attached to the present church is a monumental tablet to the memory of the Rev. Lawrence Saunders, who, February 8th, 1555, suffered martyrdom, by burning, at Coventry, for preaching here sermons in defence of the doctrines of the Reformation. There is, also, at the west end of the north wall (outside), a tablet setting forth, in exceptionally beautiful writing, that John Milton was born in Bread-street December 9th, 1608, and baptised in this church (the original building) December 20th, 1608.—R. K.

EARLY CHRISTIAN ARCHITECTURE.

SEE descriptive article on p. 97.

NEW CHURCH OF KILMALLOCK, COUNTY LIMERICK.

THE new Church of SS. Peter and Paul, about to be built in the ancient town of Kilmallock, is illustrated in our present issue. Kilmallock, though much fallen from its mediæval splendour, when it was one of the most important of the walled cities of Ireland, is still remarkable for the number and excellence of its ancient architectural monuments, both civil and ecclesiastical, which have caused it to be called the "Baalbec of Ireland." The new church will occupy a central and commanding position. Its plan comprises nave and aisles, chancel and side chapels, and tower and spire at the west end of south aisle, the sacristy and presbytery being situated on the north side of chancel. The style generally is of the 13th century, which corresponds to the neighbouring Dominican priory, founded in the year 1291 by Lord O'fally. The walls will be built of local limestone, the interior pillars of polished Cork marble. The roofs will be framed and panelled in pitch pine. Mr. J. J. McCarthy, R.H.A., Dublin, is the architect.

KENSINGTON VICARAGE.

THE old vicarage is being pulled down for the purposes of a new street leading straight up from Church-street. The new vicarage is placed on the lower part of the garden of the old vicarage house. The garden occupied about four acres of ground, one of which only is devoted to the new vicarage. The house is built in red brick, and covered with red roofing tiles, and stands on the slope of the hill facing south, so that some of the servants' offices in the basement are arranged to look out on a level with the garden. There is a large lantern over the staircase, terminating in an octagon light. The spirelet is roofed in sheet copper. There is a private oratory in the north-east corner, terminating in an apse. The remainder of the garden is being laid out as building sites.

"BUILDING NEWS" DESIGNING CLUB—LODGE AND COVERED ENTRANCE.

WE illustrate two of the selected designs, "Fleur-de-lis" and "Début," for the above subject, and refer our readers to our review for the remarks we made upon them. (See page 63.)

PROPOSED MORTUARY CHAPEL, NOTTINGHAM.

THE design which we publish to-day was prepared in accordance with the instructions given by the directors of the church cemetery, at Nottingham, for a new mortuary chapel to be erected in their cemetery. The cost was confined to the stipulated sum of £2,000. From the designs which have been selected* (the design by Mr. E. W. Godwin, F.S.A., is determined upon for erection), it seems that besides a chapel the directors intended a dead-house and a reception-room for coffins, with an inquest-room, as well as a vestry to the chapel, but as none of these were named in the conditions of competition most of those who responded to the invitation to compete sent in designs simply for a cemetery or mortuary chapel, as specified. The accompanying design only proposes to fulfil the requirements of such a chapel, and is so simple in its arrangements that it requires but little description. First, a good roomy porch is provided for the hearse and carriages. A wide cloister running at right angles with the church forms an ample approach, at once securing retirement from the public. A waiting-room, with windows commanding a view of the drive to the chapel, is provided, and over the cloister is a loft intended for a small organ, which would project slightly into the chapel through the arched opening at the west end. A wide aisle in the centre of the church secures ample space for two or three coffins without crowding. A vestry is situated at the N.E. corner, with a heating chamber under. The materials are Hollington stone for the dressings, with a local stone (hammer-dressed) for the walling. The roofs are intended to be covered with green slates and red ridge tiles. The author of this design is Mr. Maurice B. Adams, A.R.I.B.A., architect.

* See p. 99, under the head "Competitions."

SCHOOLS OF ART.

CRYSTAL PALACE.—On Saturday last Mr. Louis Haghe and Mr. Edwin Long, A.R.A., awarded the medals and certificates to lady students in the Crystal Palace Company's School of Art, Science, and Literature. The silver medal for water-colour painting in the class conducted by Mr. E. A. Goddall was given to Miss F. Fawcner, of Cornewrthy House, Lee; the certificate in this class to Miss Townsend, from Attleborough Hall, Nuneaton; and a drawing of the Pompeian Court by Miss Bertha Griffith was highly commended. The silver medal for water-colour painting in the class conducted by Mr. Frederick Smallfield was given to Miss Ledsam, of Norwood; the certificate to Miss Maud Robinson, of Streatham. The certificate for drawing from the antique in the class conducted by Mr. W. K. Shenton was adjudged to Miss Kate Gow, of St. Julian's-road, Streatham.

PARLIAMENTARY NOTES.

HEIGHT OF BUILDINGS IN LONDON.—In reply to Mr. P. A. Taylor, last week, Sir J. M'Garel Hogg said: The attention of the Metropolitan Board has been directed to the buildings to which he refers near to St. James's Park. No inquiry has been made as to how far buildings of such height are calculated to injure the neighbours, who would, I apprehend, be able to assert their legal rights if injuriously affected as regards light and air. The rules of the Building Acts at present in force are calculated for walls up to 100ft. in height, but where it is intended to exceed that height a discretionary power is given to the board, which they have not felt justified in refusing to exercise in the present instance, having regard to the unusual strength and stability of the building. A bill was introduced by me in 1874 which would have dealt with this question, but it did not receive the sanction of Parliament, and up to the present time the board has not come to any resolution to renew their application for further powers.

LONDON STREET TRAFFIC.—Mr. Gregory, last week, asked the Home Secretary whether there was any law or regulation relating to the metropolis for preventing waggons or carts stopping in the streets for an indefinite time for the purposes of loading and unloading, or for preventing the public thoroughfares being blocked for a great part of the day, as in Covent-garden and other places; and, if so, whether the police had instructions to enforce such law or regulation. Mr. Cross said that, under the regulations framed in pursuance of the Act with respect to London street traffic, no cart or wagon was to be allowed in its position longer than was necessary to load or unload, and it was for the police to see that such regulation was complied with. An exception was made in the case of Covent-garden, the traffic being so great and the space being so limited.

THE METROPOLITAN STREETS IMPROVEMENTS BILL.—On Tuesday, on the consideration of the Lords Amendments to the Metropolitan Street Improvements Bill, Mr. Fawcett took exception to the particular amendment inserted in the interests of Lord Salisbury relating to the new street from Tottenham-court-road to Charing-cross, and suggested an adjournment until Monday. Sir J. M'Garel-Hogg deprecated adjournment, on the ground that it would defeat the improvement altogether; but on a division the House, by 98 to 96, adjourned till Monday the consideration of the Lords' amendments.

A movement is on foot at Brecon for pulling down several small houses which conceal the view of the town church from the High-street.

Through the exertions and perseverance of Major Moore, pupil of the late Robert Dennis Chantrell, architect of Leeds parish church, the interesting "old cross" has been restored to Leeds, and will shortly be re-erected on its former site.

Hereford public baths have been enlarged, restored, and renovated. Mr. W. Pritchard, builder, executed the repairs, Mr. W. Smith the painting, and Mr. Edwards, of Stoke Edith, supplied the fittings.

During the progress of restoration works at Ross Church, Herefordshire, under the direction and plans of Mr. J. L. Pearson, of Harley-street, W., indications have recently been met in the east wall of the nave of Norman work, of which no traces were previously known to exist. Near the south capital of the Early English chancel arch has been found a quaint piscina of red stone, uncouthly masoned, its cap being 13ft. above the present level of the church floor. Its position has led to some discussion—the most generally accepted explanation being that a crypt once occupied the present portion of the nave, and that there was once a side altar in the chapel above.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XIII.

A Small Villa.

THE conditions of this subject required the accommodation of two sitting rooms and offices on the ground-floor, and three bedrooms and a bath-room and dressing-room on the chamber floor, the cost not to exceed £500. In selection we have had regard to the convenience of arrangement, as well as to the cubic capacity of the design. Looking over the designs, we find the cubical contents vary from 18,000ft. to 21,000ft., which has been generally worked out at 6d. per foot. "Mechlin" seems to us to combine the requisites of convenient arrangement and compactness; the ground plan is nearly a square, and has a centre entrance to a parlour 12ft. by 12ft. on the left-hand, and another, 12ft. by 10ft., with bay window, on the right, a kitchen 12ft. by 12ft. behind first parlour, and a scullery and larder, with garden entrance at the side, the last being at right angles to the front entrance. The w.c. is conveniently arranged under the stairs at side of garden entrance, and another for servants is placed externally, reached through the scullery. On the upper floor a spacious landing, in central position, gives access to three bedrooms, a bath-room, and dressing-room. The walls of the upper story are of timber, filled in with plaster, and the treatment of the elevations, the bay window being carried up and hipped with a pointed roof, and the rest gabled and tile-hung, is pleasing. The details are fairly worked out, and the windows are mullioned. The cubic contents are 18,050ft. at 6d., £451 5s. Next in compactness of planning we must place "St. Lucy." The plan is rather oblong, and has a recessed porch at one corner, a side hall and stairs lighted from the front, a dining-room 14ft. by 10in. with bay, placed in connection with the kitchen behind by a serving door, a drawing-room 14ft. by 11ft. with square bay on the return side. We take exception to the rather awkward entrance, though there is a skilful economy in the plan: the offices can be closed off from the reception rooms by a door, and they are conveniently placed at one angle of the area, while the store closet and serving door add considerably to the comfort of the arrangement. The upstairs plan is very convenient. There are three good bedrooms, a bath-room, and dressing-room, and the positions for the beds are well placed with regard to the door and fire-places. We do not approve of the thin walls of the upper story. Externally the author is less successful, though the elevations are simple and the bays well treated. A wide span roof with brick copings, into which the south bay is hipped, covers the whole area. Contents, 20,200 cubic feet at 6d. = £505. "Hampton" we place next. The lobby and hall stairs and back entrance are well placed in connection with the rooms, though the plan is not happily grouped on the entrance side. The drawing-room, 14ft. by 11ft. 6in., besides bay, is made to break out on both sides, forming a gabled front. The dining-room, kitchen, and scullery form a continuous range, the last being roofed low, and the office part is well shut off by a hall door. The author adopts a solid brick substructure, with half timbering above, the gable end being bracketted out over the canted bay of drawing-room. The drawings are carefully done. Contents, 20,212ft. at 6d. = £505 6s. "B," in circle, is less compact in plan. The entrance and stairs are on the north-west side, the offices are closed off by a door at side of staircase, the dining-room is 16ft. by 13ft., and the drawing-room 13ft. square, besides a deep bay 6ft. by 8ft. The principal rooms have the windows towards the best aspect. The bedroom over the kitchen is on a lower level, and is roofed low. The style of treatment is scarcely villa-like, and is rather too rural, the upper story is tiled and slightly timbered in gables; we certainly dislike the device at the head of the door, which is more clumsy than artistic. No cubic capacity is given. "Bee" in circle shows a convenient separation of offices, though without a direct communication between kitchen and scullery. The style is rural, but simple and picturesque. "Fleur-de-lis" is a plan with several defects, and its

author this time has not been so successful as he generally is. The porch is barely 3ft. wide, and is awkwardly placed for turning a large piece of furniture, such as a table or piano; the stairs are cramped, and the windows close to the front door highly objectionable. It would have been better if the dining-room had a serving door, to avoid crossing the hall from the kitchen. The step down from the latter to scullery is bad, the pantry under stairs opening from kitchen is a mistake. Upstairs the arrangement looks less faulty, though the bath-room, lavatory, w.c., and linen closet, all combined, is an arrangement few would like. Externally there is a want of study; the thickening and recessed seat outside of dining-room is awkward, and by no means pleasing, and we scarcely admire the treatment of the bay to sitting-room, and the high-shouldered gable over. The entrance front is more pleasing in elevation. The points of merit of the design are compactness, the thin cavity walls, the position of chief rooms, as regards aspect, and the roof, and ventilation. The materials are bricks, red stocks for angles and chimneys, and Welsh slates. Contents, 20,000 cubic feet. "Trefoil," in circle, is a very concentrated plan, about square, and tolerably well-planned, as regards the position of the rooms, and entrance hall, the stairs turning over front door—a plan not conducive to a dignified entrance, however. We object to the three steps within the hall opposite the entrance, and to the distance of the kitchen door from the dining-room, the crossing of the hall with the dinner service, and especially the wasteful arrangement shown of pinching the scullery to get an entrance into the pantry. The plan is convenient upstairs, and the rooms are of fair proportions. The upper portion of the structure is shown tile-hung, flush with outside, but there is a crowded appearance in the entrance and canted wooden bay above. Contents, 21,000ft. "Eclipse," has a plan in which the two living-rooms and kitchen form a —| arrangement; the hall and stairs run through at the junction of the parts, but the winders at bottom of stairs, and the necessity of crossing the hall every time meals are partaken of, and the nearness of the doorways of the sitting-rooms to the front entrance, are weak points. The china closet and pantry, with the pipes from w.c., &c., passing through the latter, have neither the happiest position nor the pleasantest of associations; and we dislike the combination of bath-room and w.c. This is a half-timbered design, with a verandah in front, the cubing being priced out in two parts. Main building, 18,816ft., at 6d., and the offices at 4d.; total, £500. "Discere Volo" fails in economy of plan; the kitchen door faces the entrance—a fatal objection; the connection of kitchen and scullery is awkward, and the stairs ascending close to the entrance door is awkward also. The bedroom plan is defective in the bath-room arrangement. Externally we must find fault with the porch and balcony over—a rather objectless feature—and the generally quaint details. Of a similar class is "Omega." The hall and stairs, dining-room and kitchen, are fairly placed, and the kitchen offices are shut off by two doors, but a few defects are apparent. The front door opens under the stairs, the covered balcony over bay, and the cottage-like arrangements are more rural to our minds than suited for a villa. We don't like the chimney caps. "Début" sends us a design too quaint for a villa. From the clever little sketch we might imagine a wayside inn with the flat bays of a commercial-room, but certainly not of the drawing-room of a villa. The author arranges his plan on the cross. One arm forms the drawing-room, another the kitchen, and a third the dining-room, the centre being the hall and staircase. We certainly cannot accept the haphazard arrangement of offices—fancy the pantry and larder windows overlooking the entrance; convenience, also, has not been consulted. The author indulges in a flavoured bit of Queen Anne, with its narrow sash windows and brickwork. We would add, too, that the hall would be larger than necessary, though the circular bay and landing throwing light into the hall is artistically clever. "Leizid" is a compact plan, and occupies a smaller area than any other, but the positions of drawing and dining

rooms would have been better reversed. The bath-room and w.c. are on ground floor. "Sperabo" exhibits a plan that is more original in its double-hall arrangement than practicable. The hall would be ill-lighted by the staircase window, and the same inconvenience we have before pointed out, of separation between kitchen and sitting-room, is noticeable. The treatment externally is heavy. "Prenez Garde" has not adopted the simplest arrangement: the main and garden entrance are too close to each other, and the kitchen is too far away from the dining-room. The author wants a little more experience in design, or he would never have roofed his porch as he has done. "Jacobus" sends a plan with a fair idea of concentration, and with indication of the right aim of design, but the roofing and the detail are not satisfactory. In a second group we name "Coute que Coute" with some good points of plan, but lacking coherency of design; "S. J. M." (in square), defective in design, and in showing the scullery as a passage room to kitchen; "Trefoil," a jumble of ideas, kitchen offices in basement; "Student," fair, but too Gothic; "Coute que Coute" (2), expensive in plan; "Silkworm," defective in economy of plan; another (no motto) original, but poor in plan, and too archaic. We may also name "Gad" with a circuitous passage from kitchen to dining room; "Torpedo," a better plan, but not finished; "Bath" (in circle), a better plan than elevation; and "C. H. B." more like a school-house than a villa.

A Sofa and Easy Chair.

We have only received one design for this subject, and this is by "Fleur-de-lis." The sofa is double-armed, with scroll ends cushioned, the side being open below, filled in with small turned balusters. The framing is walnut or oak, and the covering greenish or uaroon leather. The arm chair is framed with square and turned legs, balusters, and rails. The arms are parallel with the cushioned seat, and supported by small turned balusters, and the back is straight, but inclined, leading by a curve into the back legs. The chair back is of stamped leather of a suitable design, and the seat and arms are cushioned and fringed with leather. The designs are suitable, without being open to the charge of apeing the antique.

A Brick Cornice.

This subject has almost gone begging. "A. L. B." is the only design to hand, and while we commend him for his painstaking drawings, we would advise him not to attempt too much. In the present instance he has overdone his mouldings. No. 1 is the best, though the projection of the corona, or the "planceer," as it is called, is too wide. No. 2 is what we might term a pleonasm of members, and there is no deep shadow anywhere to relieve the eye. We should advise "A. L. B." to follow and study old examples before he ventures to compose a moulding. No. 3 is rather too lumpy, and the top member is too small for the lower ones. A cornice should always have two distinct parts—a cover or drip or a crown member, and a bed moulding, or a series of corbels or dentals. We cannot avoid the remark that our young architects are too prone to shirk anything of a dry or abstract kind, and we believe if we had proposed a grotesque head we should have been overwhelmed. Few things call out the exercise of the faculties of design more than a moulding.

At Keighley Petty Sessions, on Friday, a mason's labourer, named Patrick McEniff, was fined 20s. and costs on two summonses for assault and intimidation of non-union men at work on drainage works near the railway station, Keighley. A masons' strike exists in the township.

The Dorset Natural History and Antiquarian Field Club paid a visit to Bridport on Tuesday week. After a ramble along the coast, under the guidance of their vice-president, Professor Buckman, F.G.S., who pointed out the geological strata, and set the members at work, clambering the cliffs, and hammering for specimens, the members responded to the invitation of Mr. and Mrs. T. Colfox, of Rax House, and partook of dinner. Afterwards a paper, which had been written by the hostess, was read, on the "Dolmens and Cromlechs of the Channel Islands and Brittany."

ARCHITECTURAL SCIENCE CLASS.

THEORY OF COLOUR—PAINTING—
CONCLUSION.

PAINTING is the finishing art in the operations of the builder, and, though simple and of comparatively slight importance among the constructive arts we have already noticed, it is one requiring in its skilful performance a nicer amount of discrimination than many of the others. The painter should be an artist in the higher branches of his calling, and no mechanical aptitude for his work will atone for mistakes in the choice of colours and in the combination of them. A keen perception of colour in its varied tones and shades is of the utmost consequence, for, although the colours are usually specified or agreed upon, to the painter is often left the choice of the particular tint and the combinations required to produce an agreeable effect. The eye can be educated to perceive harsh or disagreeable contrasts; but it is by a knowledge of the due proportions of the primaries and their compounds that the painter is enabled to select his colours with precision, and proceed upon some recognised principle in his work. In the absence of an acquaintance with the theory of his art he is, at the best, a groper in the dark; while the mechanical workman, who understands the theory of the mixing of his colours, is better able to qualify himself for the common operations of the house-painter. The theory of colour has been concisely stated by "S. M. E." in the published reply last week. The decomposition of light by the prism known as the solar spectrum is the basis of all our notions of colour. White light is produced by a combination of elementary colours, but which we, in the rough, call red, blue, and yellow. By certain proportions of these three primaries we can produce pleasing effects of colour. If we use any primary colour the harmonious and only true contrast is that composed of the compound of the other two, and harmony results in proportion as the full complement is made up. Thus the complement of red will be the secondary colour, green—a compound of the blue and yellow. The complement or right contrast for orange (red and yellow) is the primary, blue. Again, violet (blue and red) harmonises best with yellow. On the contrary, green and blue do not form a contrast of harmony; neither do orange and red, and such combinations are best avoided. This principle is exceedingly simple, and every painter should be aware of it. In a combination of primaries the blue should predominate—the red follows as the intermediate colour between it and yellow. The proportion of 8, 5, and 3 has been laid down as the best, that being the proportion required in the production of white light. We advise our readers to study chromatic equivalents and "Chevreul on Colour." A series of articles appeared about two years ago in the BUILDING NEWS on the subject.

In reply to question 55, "Aubery" and "A. L. B." have fairly answered; but the chemical ingredients and manufacture of colours have not been considered except by "A. L. B.," who says of white lead that it is obtained from rolls of sheet lead placed vertically in earthen pots containing vinegar, and then exposed to heat; the vapour of the vinegar corrodes the lead, and white flakes are formed, which are afterwards bleached and ground. The best linseed oil is obtained from the Baltic and Bombay linseed, which is crushed and purified. It is said that its clarification by sulphuric acid destroys the cohesive property of the vegetable oil. White lead should be ground with the oil in its pure state; but modern adulteration with oils of resin, &c., is largely practised. Time bleaches linseed oil, and the older it is the better—hence the value of old ground white lead.

The process of common painting has been fairly described by "T. N.," "A. L. B.," and "J. S. A. M." The leading points are the dryness and evenness of the surfaces, the "killing" of the knots by a preparation of shellac or size, white or red lead, to stop the resin; the priming, or red-lead paint; and the finishing colours. For inside flatted work turpentine, instead of oil, is used with the colour, but external work requires oil. Pouncing should be resorted to to bring the surface to a

smooth state before the after coats are laid on. "A. L. B." mentions the use of silver leaf to cover the knots that show through the second coat. The last coat consists chiefly of white lead, and the required colour mixed with oil and turps in the proportion of 1 to 3. Graining is mentioned by "A. L. B.," but it is an imitative art that is scarcely within the province of our questions. In painting ironwork, the main consideration is the cleaning of the iron from all rust, and to coat it so thoroughly that corrosion cannot take place. Iron oxide paints are, perhaps, the best and least adulterated. A recent method of coating iron, with magnetic or black oxide, has been found advantageous; the iron is shown to resist the action of the weather as well as any mechanical injury. Boiled linseed oil, applied hot, is a good preparation for after painting. Sanding the paint adds to the durability. "T. N." mentions several anti-corrosive paints, among them Sir W. A. Rose and Co.'s oxide zinc paint (anti-corrosion), and Hubbick and Son's patent white zinc paint, and anti-oxidation ditto; Peacock and Buchan's composition; and Carson's well-known anti-corrosive paint. "Atneave," replying also to this question, says, the priming coat should always be of oil, two in coats of red lead, and finished as desired. He mentions the Torbay paint and Szerelmev Co.'s iron paint. The next question (57), on painting walls, has been fairly answered by "T. N.," "Aubery," and "J. S. A. M." "T. N." says the plastering should be first primed with glue size, and then finished as in wood painting. "Aubery" says, when the walls are quite dry they should be clearcoated or sized over, and, when this is dry, the colouring may follow. "G. H." says:—"Before painting walls their state of dryness should be taken into the first consideration, as no colour will stand upon a damp surface long. Absorbent surfaces, too, require a special treatment. Their degree of porosity must be taken into account in priming. When they are very porous the priming coat should be thinned with oil, or a coat of boiled linseed oil applied hot, so laid on as to enter the pores more freely, or the opposite treatment of sealing them up with a thick coat like glue size should be resorted to. After one or the other of these processes the subsequent coats should be of white lead and linseed oil, mixed with a little litharge or gold size, to give it a creamy consistency. The latter addition operates as a drier. Sometimes a coat of glue size is placed over the priming of boiled oil, or red lead is used to give a ground for the after coats, which should be thinner, and have a small quantity of turps. The finishing coat should be thinned with turps, and have some drier mixed as gold size. The wall should be rubbed smooth between the coats, which should be allowed to dry. Battered or hollow walls are best adapted for painting, and Parian cement being non-absorbent, can be treated with the usual coats of white lead and oil. The secret of painting walls is to give a good foundation for the finishing coat, and unless this be secured the painting peels off, or gets completely discoloured."

We have now gone through all the leading branches of building, or those trades which the architect is required to be proficient in. Their natural order, as we have discussed them, appears also to be the right order of study for the student. We have endeavoured in the questions given to lead the student to those more practical points which are apt to be neglected in the instruction afforded to architectural pupils, and those engaged in the various trades of building, leaving to him the following up of the branches we have described, and the working out of special problems. We strongly recommend him to begin with those studies that are based on geometry and mechanical principles, such as the problems of masonry, carpentry, and iron construction, as the best groundwork for the others, and the best mental discipline. If he once masters these, the other trades will be quickly acquired. Let him also, if possible, pursue his book knowledge and practical knowledge together. One will be found wonderfully illustrative of the other—in fact, in some branches it is impossible to understand one without the other. It is only by

theory and experience combined that the mind can fully grasp the conditions of a problem in construction. It requires to be led up to the theory as well as to it. In one word, what the logicians call *à posteriori* and *à priori* reasoning are necessary. In conclusion, we thank those who have so zealously followed us through the course. The benefits have been mutual. Let us hope the progress made has been proportionate to the labour bestowed. We hope to publish the award in our next issue.

CHIPS.

The governors of the Bovey Tracey Endowed Schools have selected the design by Mr. E. H. Harbottle, A.R.I.B.A., of Exeter, for their new buildings to be erected on Bovey Down. Sixteen designs were submitted.

The two principal stores of the permanent nave of St. James's Church, Great Yarmouth, were laid on Wednesday. The first portion of the church was built some years since, an iron mission-room serving as a nave. Funds have now been collected for completing the edifice, and the contract has been taken by Mr. W. E. Martin, of Hereford. Mr. J. P. Seddon is the architect of the church. The cost of the nave will be about £3,200.

Ipswich Museum has just been enriched by the presentation, by Sir Richard Wallace, of a splendid collection of crag fossils, consisting of nearly every species of mollusc found in the red crag of East Suffolk, together with remains of various extinct vertebrata.

The Bolton Corporation have under consideration designs for the laying out of the new cemetery at Rogerstead, near Gillow. Of the 13 designs sent in six have been chosen by the Parks Committee, who recommend two for the £30 and £15 premium. That for which the first prize is recommended is stated by the *Bolton Guardian* "the most in accordance with utilitarian and economical views, while that given the second place" is pronounced "by far the most beautiful and artistic."

Mr. Whistler contemplates an action for libel against Mr. Ruskin, on account of some recent articles in "Pors Clavigera," and it is said that notice of the action was served on Saturday, and that Mr. Whistler means to press it to a hearing, even if an apology should be contemplated by the great art-critic.

A new block of barracks at Tipperary is nearly completed, and will be occupied at an early date.

At the fortnightly meeting of the rural sanitary authority of Malton, on Saturday, it was reported that the new system of water supply and drainage for Hovingham has been completed to the satisfaction of the local committee. The total cost has been £1,635—£35 more than the estimate.

The offer of the Retford Corporation to purchase the gas works and undertaking for £24,000 has been accepted by the gas company, and the transfer will take effect on the 1st July, 1878.

The members of the Keighley Art Schools visited Leeds, on Saturday, and inspected the town hall, mechanics' institute, new infirmary, philosophical museum, Beckett's bank, post-office, and parish church, and spent the afternoon in Roundhay-park.

The Theatre Royal, Manchester, has just been re-decorated and improved under the direction of Mr. E. Salomons, architect, of that city.

Mr. William Duckett, late master of the Dover School of Art, has been presented with a gold watch and an illuminated address as a token of the esteem of his former pupils. Mr. Duckett is about to undertake the direction of the school of art at Barrow-in-Furness.

The foundation stone was laid last week at Stokenchurch of a new school to be erected by the Stokenchurch School Board, designed by Mr. Arthur Vernon, architect, High Wycombe. The school will accommodate 160 children.

The foundation stone of a new middle class school for girls, in the parish of St. Giles, Cripplegate, was laid on Monday week. The style of the new building will be Elizabethan, and the material red brick, with stone dressings. The building has been designed by Mr. Edmund Woodthorpe—the builders being Messrs. Bays, Brothers, and Allen, and the clerk of the works Mr. J. Coleman. The cost will be about £5,500.

On Saturday week the foundation stone of a new Presbyterian Church of England was laid at Crouch-hill. The structure will in style be Geometric Gothic, and will cost £5,500. The church is so constructed that when opened it will be capable of seating a congregation of 600, which subsequently may be increased to 900.

Negotiations have been commenced for the transfer of the gas works at Elgin from a private company to the Town Council. The arrangements will not be completed till after the elections of next November, in order that the townspeople may have an opportunity of expressing an opinion on the point.

Building Intelligence.

AISKEW.—The foundation stone of the Church of St. Mary and St. Joseph, Aiskew, near Bedale, Yorkshire, was laid on the 26th July, by the Bishop of Beverley. The building will have the character of a small country church of thirteenth-century English Gothic. There are to be a nave, chancel, and baptistery, with convenient sacristy, &c., connecting the new church with the existing presbytery. The stone walling of the church is from local quarries, and of a warm tint, which will harmonise well with the red tiles with which the roof is to be covered. A picturesque stone belfry covers the west gable facing the high road, beneath which is a traceried rose window and deeply-recessed doorway. The nave windows are of two lights, with simple tracery. A well-proportioned arch will open into the chancel, which will have simple side-lights and a four-light eastern traceried window high up in the gable. The total length of the church is 74ft. by 25ft. wide. The design is by Mr. G. Goldie, of the firm of Messrs. Goldie and Child, Kensington-square, London; Mr. Wood, of Leeds, is the contractor; and the works are under the superintendence of Mr. W. Watson as clerk of works. The cost of church, including sacristy and additions to presbytery, will be £1,575.

BIRMINGHAM.—The foundation stone of the new Church of St. Catherine, Necheels, Birmingham, was laid on Friday last. The church is being built by Messrs. Jeffery and Pritchard, from the designs of Mr. F. B. Osborn, architect, of Birmingham. It will consist of nave, chancel, north and south transepts and aisles, organ chamber, clergy vestry, and a large choir vestry. The nave will measure 80ft. long and 30ft. wide; the chancel 20ft. long and 22ft. wide. The width of the church from transept to transept will be 82ft.; and the height, to the ridge of the roof, will be 58ft. The building is to be in the style of the 13th century, and constructed of red brick and stone, with red tile roof. In the interior, the arches of the nave arcade, chancel arch, &c., will be red brick; and the columns will be stone, with moulded capitals. Light will be derived principally from a series of large clerestory windows, and from windows in the west end and in the chancel. The seats will supply accommodation for 756 persons. The estimated cost is between £6,000 and £7,000.

BOLSTONE.—The parish church of Bolstone, Herefordshire, was reopened on Tuesday week, after restoration, under the care of Mr. W. E. Martin, of Hereford, at a cost of £700, the contractors being Messrs. Stone Bros., of Fownhope. The Norman character of the building is preserved, and its shape is still rectangular. The three semi-Norman windows in the east end, peculiar to old churches in Herefordshire, have been left almost undisturbed, and form an interesting feature; and for the same reason one or two more of the old windows have been retained. Another relic which has been incorporated with the building consists of the remnants of a low Norman doorway on the north side near the west end. A portion of the west end wall also stands, and the old font is retained too, the stone having perished very little. Otherwise the building is entirely new; with the exception of the pulpit, which is of Bath stone, local stone only has been used in rebuilding. The floor of the body of the church is laid with Staffordshire tiles, Godwin's encaustic tiles being used inside the altar rails and in the new porch on the south side. The church is very small, but the inhabitants of Bolstone only number some 50, and there are seats for about 100.

BROUGHTON.—On Monday the foundation stone was laid of a new church in Cheetham-street, Higher Broughton. The church, which is dedicated to St. James, is estimated to cost £7,000. It will be built of brick and terra cotta, in the Decorated style, and will furnish accommodation for 600 adults. The architects are Messrs. Paley and Austin, of Lancaster, and the contractors Messrs. Foreman and Todd, of Higher Broughton.

COLSTERWORTH.—The parish church of St. John the Baptist was reopened on Wednesday

week, after having undergone extensive restoration. The works involved the entire removal of the barn-like structure, which for the past 100 years had done duty for a chancel, and the construction of new chancel and Newton aisle upon the old lines. Clear evidences of the design and character of the old work were found when the eighteenth century building was removed, for the whole of the east window jambs and much tracery, together with portions of the Newton aisle windows, had been buried as walling stones. The Newton aisle is separated from the chancel by a Decorated arcade of two arches. The whole of the buildings are covered with simple framed roofs. Every sound piece of ancient work has been preserved. The fittings comprise moulded and carved oak pulpit, lectern, and choir-seats, and pitch pine nave seating. Mr. J. Fowler, of Louth, was the architect, and Messrs. Rudd and Son, of Grantham, were the builders, by whom the work has been carried out. Stained glass memorial windows have been placed in the church, and also some small lights in the south side of the chancel—one representing the angel appearing to Zaccheus; the other representing John the Baptist preaching in the wilderness.

LONDON.—The Church of St. Mary Aldermary, which for upwards of sixteen months has been closed for repairs and renovation, was reopened last week. The building was commenced in 1510. A great portion of the church was destroyed in the Great Fire of London, and was afterwards built by Sir Christopher Wren, and completed in 1682 at the expense of Henry Rogers, a great grandson of Sir Henry Rogers, Privy Councillor to Queen Elizabeth. The works which have now been executed at the church consist chiefly of the removal of the cement which covered the external face of the stone walls, and reinstating the stone ash-laring; rebuilding the buttresses where the old foundations were found to exist; the reopening of the windows in the north aisle, which had been blocked up after the Fire of London; a general repair and restoration of the external stonework, including the tower; new doorways and oak doors, the removal of the gallery and old internal fittings; the fitting up of the church with new oak seats, and the chancel with stalls; the erection of a new oak glazed screen across the church, at the west end, and a new lobby to the south doorway; the erection of a stone reredos; the repaving of the church with tiles, with marble steps to the chancel; the reglazing of the windows, principally with painted glass. The works have been carried out from the designs and under the superintendence of the architect, Mr. C. Innes, of 27, Queen-street; Mr. C. Fish, of Pimlico, was the contractor for the general works. Messrs. Simpsou and Sons, of St. Martin's-lane, provided and laid the tile paving.

LOUTH.—The new reredos of the restored Church of St. James, Louth, has just been completed from the designs of Mr. James Fowler, architect. It is composed of Ancaster stone and alabaster, with green marble columns, and consists of three central canopied compartments and four lesser ones. Each contains a statue executed in the purest Carrara marble. That in the centre represents our Saviour, the compartment on either side being occupied with a figure of an angel, while the outer ones are filled with those of the four Evangelists. The statuary was executed by Mr. Samuel Ruddock, of West-street, Pimlico.

METROPOLITAN BOARD OF WORKS.—On Friday the clerk was directed to reply to a memorial from owners and occupiers in South Hackney, complaining that it is the intention of the trustees of the Cassland Charity to let the triangular piece of ground in the Kenton-road for building purposes, that the Board do not consider it desirable to interfere in the matter. It was decided to establish a fire brigade station in the neighbourhood of Knightsbridge, and to purchase the 80 years' lease of a house in Chapel-place, and two stables in Renton-mews, Brompton, for that purpose. The Board also agreed to institute a bronze medal to be given to men of the Metropolitan Fire Brigade who distinguish themselves by extraordinary bravery at fires. On

the recommendation of the Building Committee the application of Mr. F. Butler, for approval of a plan for the construction of buildings to be named "Alexandra Mansions," in Victoria-street and Alexandra-street, with walls exceeding in height the limit prescribed for dwelling-houses by the schedule of the Metropolitan Building Act, 1855, was not granted; and the application of Mr. John Whichcord, on behalf of Mr. H. A. Hankey, for approval of a plan for the construction to an additional height of the external and cross walls to the south wing of Queen Anne's Mansions, Queen's-gate, Westminster, was similarly refused. An official representation, under the Artisans' Dwellings Act, was received from Mr. John Little, as medical officer of health for Whitechapel, with reference to certain areas in the parish of Spital-fields; on the other hand, Mr. T. Stevenson, medical officer of health for St. Pancras, wrote to state that an area in Brook's-gardens and King's-cross-road, as to which complaint had been made by twelve ratepayers, was not, in his opinion, an unhealthy one for the purposes of the Artisans' Dwellings Act. The first of these representations was referred to the works' committee, and to the finance committee was relegated a letter from the vestry of Islington, applying for sanction to their borrowing, and requesting the Board to advance, the following amounts, to be repaid by instalments extending over a period of twenty years—viz., £3,750 for erecting stabling, workshops, &c., on the old workhouse site, Liverpool-road; £600 for an extension of mortuary buildings at the Chapel-of-Ease grounds; £1,800 for the erection of additional office accommodation at the vestry hall; and £500 for the erection of an open shed at the old workhouse site, Liverpool-road.

MILTON, DEVON.—The foundation stone of a new church at Milton, near Buckland Monachorum, Devon, has been laid. The building will consist of nave, 37ft. 6in. by 20ft., chancel, 20ft. by 15ft., a vestry, and west porch. The style is Early English. The nave will be lighted by six 2-light windows of Bath stone. The eastern triplet chancel arch will be constructed of Hamhill stone. At the west end of the edifice there will be a bell-turret of Bath stone. The quoins are to be of Roborough Down stone, and the walling of local stone. The nave is to be seated with chairs to accommodate 110, and the choir seats, in the chancel, of oak, having Minton tiles in the sacarium and avenue. The roof is to be open, of red deal, plastered between the rafters. The contractor for the new building is Mr. Blowey, of Buckland; the architect, Mr. Ashworth, of Exeter.

SHEFFIELD.—The new covered wholesale vegetable market, which lies between the Market Hall and the Old Corn Exchange, Sheffield, was opened on Monday. The roofing, which is entirely of iron—wrought and cast—is remarkable for its simplicity and adaptability for the purpose for which it is required. The roof is supported on metal columns, and is glazed, without the use of putty or paint, on the principle patented by Mr. W. E. Rendle, and to which we have frequently alluded in these columns. It is perfectly watertight, and presents a light and elegant appearance. The pavement of the market is asphalted, and divided into squares. The cross avenues by which carts enter are 27ft. wide. When completed, by the demolition of the Old Corn Exchange, the space covered will be upwards of 5,000 square yards, or rather more than an acre. The entire fulfilment of the scheme must await the rebuilding of the Corn Exchange, the plans for which are in progress. Messrs. Hadfield and Son are the architects; the roofing has been executed by Messrs. A. Handyside and Co., of Derby; and the masonry, &c., by Mr. John Pearson, of Sheffield.

WENTWORTH.—The new church of Holy Trinity, which has been in course of erection at Wentworth during the past five years, as a memorial to the late Earl and Lady Fitzwilliam by members of the family, was opened on Monday. Mr. J. L. Pearson, of London, the architect, has adopted Early English as the style for the church, which consists of nave, north and south aisles, and transepts, chancel, and vestry. The external length is 130ft.—the chancel being 25ft. long, the transepts 20ft. across; the nave, including aisles, is 53ft.

wide external, and 46ft. measured internally. The space between chancel and nave is lighted by a lantern tower, the parapet of which is 100ft. from the ground; from it springs a spire, rising to a total height of 196ft. from the ground. The edifice is built of Darfield and Hooton Roberts stone; the roofing is of grey-stone slates; the pews and all other woodwork are of English oak; the pulpit, reading-desk, communion-table, and rails being handsomely carved. 550 worshippers are provided for, all on the floor level. The internal roof is groined, the clerestory windows have curtain arches, and the arcades and capitals are ornamented with dog-tooth and nail-head carvings. The design for a stone reredos has been prepared, but has not yet been executed. The floors have been laid with Roman mosaic paving by Messrs. Birks and Co., of London. The heating is by high-pressure water pipes, supplied by Mr. Baiton, of London; and a series of sound-tubes have been laid from the pulpit to various parts of the building. An organ has been erected by Mr. Willis, of Camden town, in the north transept, at a cost of £700. Mr. G. W. Booth, of Bedford-street, Covent-garden, W.C., and Gosport, was the contractor. The total cost is estimated at £25,000.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. Price 2s. weekly. (Annual Subscription, post-free, Eleven Shillings.) The number published August 3 contains articles on The Extinction of Fires, Artisans' Dwellings in New York, A Plan for Rendering Salt Meat More Nutritious, The Drainage of the Borough of Bristol, The Manchester and Salford Sanitary Association, The Public Health of Switzerland, The Water-Bearing Strata of Bristol, Influence of Impure Air Upon Heart Disease, The Yorkshire Association of Medical Officers of Health, Official Medicine in Ancient Rome, Aids to Sanitation, Sanitary Science (by Mr. J. J. Mechi), Public Health Reports, Local Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, Editor's Table, Gleanings, &c. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage uncharged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

ARCHITECTURAL SCIENCE CLASS (Received).—S. M. E. (Shall bear your request in mind.)—A. L. B. (refers to the great advantages he has derived from the Science Class, renders us his thanks, and hopes again to be able to contribute.)—Attneave.—Aubrey.

HONEST INDIGNATION (who is so lavish of epistles, should at least put his own name and address to his criticisms. Let him do so, and we will insert his letter). HISTORICAL (next week).

Correspondence.

"MANSIONS IN THE SKIES," STORY'S-GATE.

To the Editor of the BUILDING NEWS.

SIR,—This agglomeration of dwellings—story on story—has been certainly an appropriately-named locality. It must be a "straight gate," too, to reach the stories; but *chacun à son goût*.

It is impossible, Sir, to regard this wonderful pile of brickwork without grave considerations anent the Building Act and its operations, and in the interests of the public I beg to make a few remarks. I should like to know whether complete plans of these buildings were laid before the district surveyor; whether he took counsel in such an exceptional case; and whether the work has been carried out according to his instructions, and under his supervision. This, Sir, is important not only as regards the work done, but because I hear it is the intention of the proprietor to do much more of the like description. The Building Act requires that "separate sets of chambers tenanted by different persons be deemed to be separate buildings, and be divided accordingly, so far as they adjoin vertically by party walls, and so far as they adjoin horizontally by party arches or fireproof floors." The more recently erected portion of these buildings has, agreeably with the rule quoted, fireproof floors; but the first block of building, I believe, has not such. Why not? Simply, I suppose, because the proprietor did not see the necessity of it. Though the intention of the Building Act is plain, yet here are huge blocks of dwellings, part of which are fireproof, part not, and can any one look up at these monstrous structures, and consider the number of lives jeopardised in case of fire, and say there is not as much reason for fireproofing in one case as in the other? A grave responsibility rests somewhere. If the proprietor of such intended structure does not choose to declare the purpose of the building, I do not see that there is any way, so far as provision in the Building Act is concerned, of obliging him to use fireproof construction, but there ought to be. If the district surveyor, in this instance, knew the purpose of the structure, why are the terms of the Building Act not adhered to? As regards thickness of walls, the Act would require in these buildings "Two stories 2½in., three stories 17½in., remainder 13in."—the thickness of a cross wall being two-thirds of the foregoing. By a gross oversight, no distinction is made in thickness of walls between a fireproof building and others, yet the weight on the walls in the one case is immensely increased. Such dimensions as I have quoted in such a building as I am now noticing, with brick or concrete floors, are simply absurd. Consider, Sir, the weight of twelve solid floors in a building over a hundred feet high, being borne by 13in. walls in basement; and consider, too, what brickwork often is! Yet this is the Building Act. They ought to be twice the thickness. Of course, it may be said that it is the duty of the surveyor, when occasion requires, to oblige builders to increase the thickness. But does he, and should it be left to him? It appears to me there should be separate tables for fireproof buildings in the Act—as little left to the surveyor as possible; and as even, without fireproof floors, the thickness of walls named is not sufficient for buildings of this height, extra provision should be made accordingly.

In the first erected block of these buildings two or three of the top floors have no front wall. This I consider a gross infringement of the Building Act, which requires, "brick, stone, or other incombustible substances." Of course, it will be said that these floors are in the roof; but, in fact, they are not. If I wanted to build a three-story house, and should seek to erect from ground level a front thereto of wood covered with slate, just a shade out of the perpendicular so as to "cheat the devil," I should be stopped, and told the Act did not allow it. But if my proceedings are bad at ground level, would they be less so if these stories are lifted a hundred feet in the air, being called a roof? Are not, in the latter case, the conditions a

thousand times worse? Why, then, is it allowed?

From the opinions generally expressed, it is certainly a question, Sir, whether such excessive height of buildings, as here, should be allowed. If there are not powers in the Act, or its executive, to insure moderation, there should be. In a general way it may be difficult to specify the height of folly, or the height of imprudence, but I fancy they are reached here. What say you? This same question about fireproofing needs be answered in respect of the blocks of artisans' dwellings now erecting—the Building Act being impudently and openly set at naught. If a fire should take place in any of these conglomerate households (and sooner or later it may be expected), and lives are lost (which would pretty certainly be the case), would the surveyor, proprietors, architects, and builders, be hanged? They certainly ought to be. Is the law to be wilfully set at defiance, and life thus wantonly endangered for the sake of gain? That so many women and children should nightly seek their rest under such dangerous conditions, is to my mind a frightful consideration. Nor are circumstances much improved, I consider, when tanks and hydrants are provided. We know in the cases of the Crystal Palace and the Opera House "conflagrations," how useless such provision was proved to be.—I am, &c., M.

HOW NON-SURVEYING ARCHITECTS "PROTECT" THEIR CLIENTS.

SIR,—One of the contributors to your last number thus writes on the subject of "The Architect and the Employer":—"The recent controversy (about quantities) has been waged between those who believe the architect should primarily protect his client and be thoroughly independent and those who see no harm in making an additional 2½ per cent. on quantities supplied to the builder." I should be sorry to charge your contributor with having intentionally made a disingenuous statement; and I can, therefore, only conclude that he did not read the correspondence he writes about. Had he done so he would have seen that one great point in favour of the surveying architect is, that he can protect his client from the enormous overcharges which are caused by excessive quantities; whereas, the non-surveying architect cannot, and does not. A single fact is worth a great deal of theorising, and I will give you one which occurred in my own experience. The names and dates are omitted for obvious reasons; but I shall be happy to give them to you confidentially.

Some years ago a large public building was erected in London, and I happened to be so connected with some of the promoters that I had an intimate knowledge of the facts relating to it. The architect was a Fellow of the Institute, who prided himself upon conforming rigidly to its rules, so it is needless to say that he did not take out his own quantities. These were prepared—as your contributor recommends—by an independent surveyor, appointed with the concurrence of the employers. The tenders came in, high, of course; they generally do come in high with an independent surveyor. In the end, however, the lowest tender was accepted, and the place was built, though the architect never regained the confidence of his clients, which he had lost through the great excess of the outlay over his estimate. This was the end of Act I.

Act II. began a few years after. The large public building had got dingy, and wanted painting. The managers determined to have it repainted exactly as at first. They invited tenders, and supplied persons tendering with a copy of the painter's bill in the original quantities. A few trifling additions and deductions were made in this bill, to allow for the small deviations from the contract which had taken place during the erection of the building; but the bill, as a whole, was substantially the same as at first. The tenders came in—astonishingly high, as before. And another architect got into hot water because his estimate was alarmingly exceeded. The lowest tender was not very far short of a thousand pounds; but it was, after some hesitation, accepted. The work was done and paid for. This was the end of Act II.

Act III. opens after an interval of three months. An old friend of mine happened to meet with a confidential clerk of the firm that had done the painting; they got into conversation about business, and about the way in which contracts turned out. "I wish," said the clerk, "that they all turned out as well as the one we have just finished for painting _____," naming the building in question. "Why?" said my friend. "Well," said the clerk, "our firm ordered paint and varnish enough to do the work taken in the quantities; and, when the place was finished, they had nearly half of it left."

This story—for the truth of which I can vouch—may have some interest both for architects and clients. The clients in this case, by employing an independent surveyor, were clearly robbed of £400 in a contract of less than £1,000. How much they were robbed of in the first contract—that for building—we shall never know; but it would probably be a moderate estimate to say as many thousands. Their architect protected his clients' interests in the way that the Institute advocates, and that your last week's contributor recommends; and this is the sort of protection they got. Your contributor thinks it hard that a client should have to pay his architect 2½ per cent. for taking out the quantities and making sure that they are not excessive. Now, 2½ per cent. on the contract for painting which I have named would have come to about twenty guineas, and the actual dead loss in cash, through excessive quantities, was about four hundred.

As to the two architects who got into disgrace through the agency of this "independent surveyor" the second, perhaps, may be pitied; but the first only reaped the fruits of his own folly. His estimate was largely exceeded because the quantities were largely in excess; but they would not have been in excess if he had not allowed them to be turned over to a person in no way responsible to him. His clients suffered, and they blamed him; and, on the whole, he got what he deserved. It may throw some light on the cause of the outrageous excess, or, in plain English, of the barefaced robbery, to say that the surveyor who was originally appointed called in a second surveyor to help him to take out the quantities for the building, and that the second surveyor was closely connected with the builder whose tender for the original contract happened to be the lowest.—I am, &c., CLAMANS IN DESERTO.

WAITING FOR A DETAIL.

SIR,—In reply to the letter in your paper of last week, I am really puzzled to see what the writer is driving at, or what is the full nature of his complaint. Surely he has plans, and a specification to guide him—no doubt the power, if a detail supplied, to lay before the architect or his clerk of the works, at the same time pointing out where there is more work than contemplated, and ask to have the same altered. But I am afraid "Consider the End" is like a great many more—has taken a contract, and now wants to shirk half of his work, giving the architect and clerk of the works no end of trouble and uneasiness. This class of contractors, I am sorry to say, are too often to be found, and have not considered the end until it is too late.—I am, &c.,

A CLERK OF THE WORKS.

DISTRICT SURVEYOR AND PLANS.

SIR,—Might I ask through your pages how far and on what authority it is customary for the district surveyors to demand a copy of plans of public buildings to be deposited with them? I am building a school chapel in London, and on the builder calling to give the notice required by the Building Act he is asked to deposit a set of plans, on the ground that it is a public building, and that it is the custom. Never having been required to do so before, I wrote to the surveyor to that effect, and his reply says:—"The custom is without exception, so far as I know, for copies of drawing relating to the construction to be deposited with the district surveyor. . . . The question has been decided upon by a magistrate, and I therefore think it is unnecessary for me to say more."

Finding, on inquiry, that several of my friends, though they have executed many public works in London, have (with one exception) of a similar demand from the same surveyor to an architect of 30 years' practice, and who has never had a request to the same effect made before) not had any such demand made, I inquired at the Metropolitan Board of Works as to whether I ought to deposit plans, and am told that "the surveyor is quite right in asking for them," and is empowered by the Building Act to do so, as a record of the work, and to enable him to supervise the building. But, as I cannot see anything to that effect in the Act, and, so far as I can learn, it is not the custom, I should feel obliged if some of your readers would give me the benefit of their experience and better knowledge. I enclose my card.—I am, &c., AN OLD SUBSCRIBER.

EGYPTIAN ARCHITECTURE.

SIR,—Your art critic in a late discussion stated that in the works of Viollet-le-Duc and others were proofs that the Egyptian temple courts were covered with awnings. I cannot find such, and should be glad if he would point out such passages, the existence of which I am sceptical of.—I am, &c.,

ONE IN EGYPTIAN DARKNESS.

CHILDREN'S HOSPITAL, CARDIFF.

SIR,—Without entering into the merits of the design, which are striking, and I think apparent to all, I venture to say a word in favour of the drawing which you qualify as "hardly does it (design) simple justice." According to my judgment the drawing possesses artistic charm, colour, breadth, and suggestiveness or mystery, all which qualities are observable in the best pen-and-ink work notable in Mr. Street's perspectives, and some few others. It seems to me that this style of drawing is infinitely preferable to the ruled, mechanical, and soulless representations of current architecture we are too often accustomed to, and I think I remember Mr. Ruskin somewhere speaking of such work as mere diagrams.—I am, &c., ASBURY JACKSON.

Intercommunication.

QUESTIONS.

[5077].—Black Boards.—Will any reader say what is the best preparation for blackening these for school purposes?—NOVICE.

[5078].—Colouring Lithographs.—I wish to colour some of the lithographs in the BUILDING NEWS, but the paper on which they are printed will not take the colour, and it spreads over and beyond the parts intended. Will some of your readers kindly give directions how it can be done?—CONSTANT READER.

[5079].—Church Roof.—Would 4½ by ½ wrought, matched, and jointed pitch pine make a suitable boarding for a church roof, nailed to back of rafters one foot apart, to be covered with felt? What are the names and addresses of the best makers of inodorous felt for this purpose?—QUERIST.

[5080].—Frames for Mullioned Windows.—I wish to fill in a mullioned flat-headed window with plate glass, making some of the lights fixed and some to open outwards. Is it necessary to have iron frames for the fixed parts, or can the glass be inserted in the stone? And what is the best section of casement for the opening parts? Also state if stone head, supported by several mullions, requires arch above it?—PEN.

[5081].—Professional Charges.—Will some reader kindly inform me—1. What would be reasonable charges for preparing plans, sections, and specification for carrying out a new cemetery, which is about 2½ acres, and superintending the work of forming the parts, &c.? Also preparing a plan, which is to be kept for permanent use at the cemetery? This plan shows all the grave spaces numbered, with proper references. 2. What would be a proper charge for preparing plan, sections, and specification for forming, fencing, kerbing, and macadamising new roads, and superintending the work, the contract being £360?—INIGO.

REPLIES.

[5081].—Removing Putty.—American potash applied to old putty will soften it so that the glass can be easily removed.—M. HAWNEY.

[5083].—Ambulance.—"Hospital" desires to know the meaning of the above word applied thus: "Detached laundry, ambulance, stable, &c., to be

provided." The meaning of the word is a moving hospital. The manner in which it is applied will not change the meaning, but may make it greater or smaller; thus, if applied in connection with an army it would appear greater than coupled with a hunting expedition. The word is sometimes applied to a litter or portable bed to carry sick people, and also to a carriage used for the same purpose.—J. MORRISON.

[5061].—Iron Girders.—If the rust be carefully scraped off, particularly in the angles, and then the iron be painted three coats red lead and oil, it will effectually stop further corrosion.—M. HAWNEY.

[5065].—Main Sewers.—Allow me to thank "G." and "Assistant Borough Surveyor" for their replies to my queries on this subject, and to trouble them for their ideas on the following:—Supposing a town built on the coast is to be drained, or rather re-drained. The lowest point of the town is 9in. above high-watermark. For a distance of some 500 yards the town runs inland at a comparative level, and the surfaces of the streets are about 18in. or 2ft. above high-water spring tides. From this plateau the town—or by far the larger portion of it—rises in terraces and streets at an angle of about 30 degrees. Now, the drainage, as may be imagined, in the upper part of the town is efficient, but in the lower part is very defective, and to remedy this is a task. Will "G." or "Assistant Borough Surveyor," kindly state (1) what size drain is required for 3,000 population, at a fall of, say, 1 in 20? (2) What size drain is required for 2,000 population, at a fall of 1 in 200, including the discharge of the sewers No. 1? (3) How would you construct an outfall so as to prevent flooding at high tides? And (lastly) is the theory of "soil to the sewer, and rain to the river," a good one? Is it not wasting or refusing a valuable agent in cleansing sewers—I mean by diverting surface drains to the river?—OUTFALL.

[5088].—Felt in a Roof.—I do not think any advantage would be gained by putting felt on the wooden ceiling. Under slating it takes, in a measure, the place of rendering—that is, when slating is laid on wooden sheeting. The lap of slating varies with the pitch of roof, but for the slate mentioned from 3in. to 3½in. ought to be sufficient.—M. HAWNEY.

[5073].—Wall Decorations in Distemper.—I quite agree with the *Lancet* that this process of cheap wall decoration ought to commend itself to every one, but am surprised that this advocate of sanitary perfection should have recommended it being applied "over paper of almost any description," as a great temptation is thus offered to the landlords of small property to cover up dirt and filth, leaving undisturbed those hemipterous insects that are the trouble of London visitors at a sea-side boarding house. If the walls are properly prepared for painting (see "Architectural Science Class") before applying the distemper, then I do not think "Kappa" will find a better process of wall decoration at a moderate cost. I must remind "Kappa" that the appearance of the work depends specially on the workmanship. The distemper is prepared as follows:—The white colour or base generally used is the best whitening, dissolved in a little water, and when in a thick paste hot size is poured and mixed with it to render liquid. The tints are then added and allowed to set. The quantity of size or water is regulated according to the weather. Any dry colour may be used for tints, but must be ground fine in water to ensure the most minute division of particles. It will not require more than two coats to cover a properly prepared wall. I have seen patent preparations used, but I like the above better. I do not advise the use of distemper colour on flock paper, and recommend "flating" (see "Architectural Science Class," No. 55) as more lasting and more suitable to the class of room boasting a flock paper. "Flating" is very effective on a good pattern. Distemper colours should only be used for cottage property, but in new buildings it is as well to distemper the whole of the walls for the first year, as it does not show the damp as paint or paper.—J. A. HOWICK.

[5076].—Legal Fees.—If the "Architect's Assistant" is in the employ and pay of the architect, his master would be entitled to the fees which are earned while he is giving evidence during his employer's time in a lawsuit, supposing there were no agreement between them existing on the subject.—W. R.

[5082].—Warming Rooms with Hot Air.—Will some one be kind enough to give me some information on the above subject: I want a pipe to pass from the garden, behind the kitchen fire, into a room above. How many cube feet will a 3in. pipe warm? Also, who are the makers of the necessary pipes, saddles, &c.?—S. Y. D.

[5083].—Arch or Lintel.—Would any of your numerous correspondents inform me whether an arch or lintel will, with the same weight, be the more durable, and which will bear the greater weight?—PUPIL.

A large portion of the south side of the west tower of Lichfield Cathedral is now encased in scaffolding, and workmen are busily chiselling off the cement and the face of the old stonework. This is done to the depth of seven inches where necessary. The stone beneath the facing is in splendid condition. Mr. Tebbs is in charge on behalf of Mr. Thompson (of Peterborough), the contractor; and Mr. Barnsdale is responsible for the scaffolding and woodwork.

LAND AND BUILDING SOCIETIES.

NATIONAL BUILDING AND LAND INVESTMENT COMPANY OF IRELAND.—The 12th annual meeting of this company was held at Dublin on Saturday, when the report was read showing that the deposits had increased during the year by £15,000, and that the share capital has now reached nearly £32,000. A dividend of 6 per cent. per annum was declared for the half year, a similar *ad interim* dividend having been made during the previous half year; this will reduce the balance on profit and loss account from £3,118 to £2,240.

LEGAL INTELLIGENCE.

ACTION AGAINST A CORPORATION.—A SHABBY DEFENCE.—At the Cambridge Assizes, in the Nisi Prius Court, before Sir William Balloil Brett, an action was this week brought by Messrs. Neave and Co., contractors, of Sidcombe, Kent, to recover certain moneys from the Mayor and Corporation of Wisbech, the balance of a certain contract for extensive works. They claimed on two contracts, in the first a balance of £935, in the second of £837. For the defence it was urged that the plaintiffs had agreed to keep the works in repair for 12 months after completion, that defects had arisen that plaintiffs refused to repair, and the Corporation had repaired at an expense of £470. His lordship held that the defects were defects of engineering and did not arise from any fault of the contractors. They cost, too, only £470 on a contract of £20,000, and the defence was a shabby one. Verdict for the plaintiffs in both cases.

A LAND SOCIETY SECRETARY'S SALARY.—At Rotherham County Court on Saturday, Judge Ellison gave his decision in a case of some interest to land societies and their secretaries. John Walker, of Sheffield, had sued four persons as trustees of the Sandhills Freehold Land Society, Rawmarsh, to recover £41 for services rendered as secretary to the society, and also for damages for wrongful dismissal. Plaintiff said he acted on behalf of the society from October, 21st, 1874, until January, 1876, and had received from the society £4 for one year's services. A witness named Horner proved that, prior to his engagement as secretary to the society, plaintiff said he should be satisfied with whatever remuneration the society might think fit to award him. This agreement his Honour held was binding on plaintiff, but he considered that he was entitled to £4 for wrongful dismissal, as the rules of the society provided that the secretary should be appointed annually. Verdict accordingly.

BREACH OF BUILDING BYE-LAWS AT CARDIFF.—At Cardiff Police-court, on Monday, William Lane, of Gibbet-hill-road, was charged with allowing two houses to be occupied before they had been certified by the borough surveyor. Defendant admitted the offence, adding that he had previously built 30 houses on Corporation ground, and had never received certificates from the surveyor. Thomas James, of Morriston; William Dovie, Hafod, Morris Griffiths, Landore; William Lloyd, Morriston; David Williams, Plasmore; William Loosemore, Burrow-road; and William Pyle, were charged with similar offences. Mr. Cousin, the surveyor, said that in no one of the cases would a certificate have been granted if applied for, as the houses had not been completed in accordance with the plans deposited and approved of. The town clerk, who appeared for the prosecution, stated that the defendants had received notice to comply with bye-law 24, the one which dealt with the cases. He admitted that it had not been generally enforced. The cases were adjourned for a month to give defendants opportunity for compliance. At the same sessions John Edmunds was charged with building a house in Simmons-street not in compliance with the plans deposited. It was shown that defendant had encroached 9in. on the street, and that the house has been built up to the roof. The presiding magistrate said the bench felt bound to treat the offence as a very serious one, and to inflict a heavy penalty. The practice spoilt the appearance of the streets, and injured the health of the town. A fine of £5 would be imposed. Defendant said he knew of many cases where builders had encroached to a greater extent than he had, and had not been prosecuted.

The surveyor to the Ilfracombe Local Board of Health stated, at a meeting of the Board on Monday that there was only one mason in the town who could use a hammer and chisel. Good opening to banker-hands according to this statement.

The Aberdeen Harbour Commissioners have received a report from Mr. Dyce Cay, the resident engineer, in which he recommends that the jetties in the harbour channel should be extended this season at an estimated cost of £4,600, with the view of preventing storms from affecting the inner harbour, and that next session Parliamentary sanction be sought for the diversion of the river Dee out of the harbour and dredging, at a total outlay for the works of £103,000, besides the erection of a new quay and goods' shed on the south side upper dock, and other works, estimated at an additional £26,000.

Our Office Table.

A NEW and simple apparatus for facilitating the cleansing of both sides of a window from the inside of an apartment has been devised by a Perth man, and a sample has just been fitted up in the office of Messrs. Cruickshank and Fulton, consulting engineers, Glasgow. A portion of the rod at one side of the window is made removable, and the suspending cord at the same side is capable of detachment. At the other side of the window hinges are provided for each sash, on which they are swung inwards. In opening the window the movable portion of the rods are taken out. The sashes are alternately raised and lowered in the usual way into gear with their hinges, and, the suspending cords having been detached, the sashes are easily turned on their hinges inwards, and a person standing inside can comfortably reach the different panes.

An Artistic Congress is to be held at Antwerp on the occasion of the tercentenary celebration of the birth of Rubens, in order to consider various questions in relation to the development of art. The sections will be classed under the heads of "Æsthetic and Philosophic," "Artistic and Economic," "Architectural," and "Historic." The following subjects will be considered by the Architectural Section:—1. Ought not each country to respect in its buildings the traditions of its national architecture? Thus, in Belgium, would it not be better to return to the types of the thirteenth to seventeenth centuries, adapting them simply to modern necessities? 2. Is it not desirable that the State should have a right of control over its architecture, especially over modern constructions in the neighbourhood of old monuments?

In celebration of the jubilee of the General Union of Carpenters and Joiners a meeting was held last week in the Co-operative Hall, Downiu-g-street, Manchester. Delegates were present from about 40 towns in the United Kingdom, and they were hospitably received by local members of the union. Mr. Joseph Reay presided. A statement was made by Mr. R. Last, the general secretary, to the effect that the union now numbers 12,000 members, about 2,000 of whom are resident in Manchester, and that the organisation was never in a more flourishing condition than at present. Addresses were delivered by Mr. C. Matkin (London), Mr. J. Lindsay (Pendleton), and others. Mr. Lindsay, who stated that he had left three towns owing to strikes, referred to the present dispute between master joiners and the men in Manchester, and said that, though some persons might think they could have managed things better, he had the fullest confidence in the Strike Committee acting on behalf of the men. He hoped that in the course of a few more weeks the struggle would be over and forgotten, and that the men would be enjoying the advantages which they were so nobly fighting for.

A BUILDING has recently been erected in Derby, to be permanently devoted to the purposes of art-education, and its completion is now being fittingly celebrated by an exhibition within its walls of paintings, sculptures, and other forms of art, of unusual variety and attractiveness. Contributions have been successfully applied for from the art-collections in most of our leading towns, such as London, Birmingham, Manchester, &c., while many valuable cases of jewellery, electrotypes, Persian pottery, with examples of decorative art by Messrs. Poynter, Leighton, &c., have been lent by the South Kensington Museum. The Indian works of art and textile fabrics are the loan of the Secretary of State for India, and are numerous and interesting. The collection of paintings numbers over 700. The collection of bronzes is particularly good, as are those of Dresden china, Laubeth faience, terra-cotta wares, &c.

On Saturday a deputation, representing over 60 municipal corporations, waited on the trustees of the British Museum, for the purpose of submitting to that body that it had now become necessary that the collections contained in that and other national institutions,

and which were to a large extent provided and supported by public grants, should, as far as possible, be rendered available for the benefit of museums under the charge of provincial corporations. The deputation was headed by Mr. Joseph Chamberlain, M.P. The trustees present at the Museum to receive the deputation included the Duke of Somerset, who, replying to the deputation, pointed out that in order to enable the trustees to lend any of the objects in the various collections of the museum, special legislation would be necessary. He promised, however, that the matter, which he considered a very important one, should receive careful consideration.

The Shipley School Board inspected, at its last meeting, several school desks on the dual principle, the models of which had been made by Mr. Titus Salt (chairman of the Board). The desks consist of a pine incline, large enough to allow 2 scholars to work comfortably; this is mounted on a strong yet light framework of wrought and cast-iron. The seats are in chair forms, upon a stout pedestal of iron, which, like the desks, is screwed down. It was stated that the cost would be "moderate."

THE statistics as to the capital, dividends, receipts, working expenditure, rolling stock, mileage, &c., of the railways of the United Kingdom in 1876 are issued. They show that the total authorised capital in that year was £741,802,527, an increase of £24,026,829 on the preceding year; and the total paid-up capital £658,214,776, an increase of £27,991,282. The number of miles open for traffic at the end of the year was 9,169 double and 7,703 single, in all 16,872, or 214 more than in 1875. The number of passengers conveyed, exclusive of season ticket holders, was 538,287,295, or 31,312,061 more than in 1875. The gross receipts from passenger traffic were £26,163,551, and from goods traffic, £33,754,317; in all, £59,917,868, or £935,115 in excess of the gross receipts of the previous year. The miscellaneous receipts amounted to £2,297,907, or £43,660 more than in 1875. The aggregate receipts were thus £62,215,775, or £978,775 above those of the preceding year. The working expenses were £33,535,509, against £33,220,728 in 1875, leaving net receipts to the amount of £28,680,266. The working expenses were 54 per cent. of the gross receipts, the percentage being precisely the same as in 1875, but the net receipts were only 4.36 of the total paid-up capital, as against 4.45 per cent. in 1875, a proof that the calls on shareholders were more numerous last year.

At the last quarterly meeting of the Hants Diocesan Church Association the following building grants were made:—To Gatton, for parsonage, £110; Ashey, for mission chapel, £30; New Town, for enlargement and repairs, £20; Totland Bay, for parsonage, £50; Whitsbury, restoration, £50; Shipton Bellinger, restoration, £50.

Last week the Town Hall of Aberdeen was formally opened, after being altered and re-decorated. The roof of the hall has been heightened 4ft., and panelled with oak, divided into 84 compartments, in each of which has been inserted a shield in *carton-pierre*, bearing the emblazoned arms of those who have rendered service to the city.

A few days since, says the *East Anglian Daily Times*, the asphalt flooring of the Lowestoft Skating Rink appeared to be "blistered" in several places, and it was found that it was caused by the forcing up through seven inches of concrete of some asparagus plants, the roots of which had been left in the ground, which had formed part of a kitchen garden.

The Brighton and South Coast Railway are about to construct a second line from London to Eastbourne, and the Duke of Devonshire has guaranteed £200,000 towards the construction of a direct line between the same watering-place and the Hastings branch of the South Eastern Railway.

New schools were opened at Woodland, county Durham, on Monday. They have been built from plans by Mr. Richard Littlefair, of Copley, near Cockfield, by Messrs. W. and R. Blackett, of Bishop Auckland, at a cost of £800, including purchase of land, and accommodate 205 children. The school furniture will cost about £60 more, and will be supplied by the School Furnishing Company, of Darlington.

Lord Waverley is about to have erected, in the People's Park, Todd's-hill, Ballymena, a statue representing Armed Science. The pedestal, a cube of Dungannon sandstone, weighing three tons, was set in its place last Thursday.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 10, 1877.

VIOUET-LE-DUC ON ARCHITECTURAL DESIGN.

SOME time ago we noticed one of the earlier parts of Mr. Benjamin Bucknall's translation of Viollet-le-Duc's Lectures: we now take up another part of the work in which the causes of the decline of architecture, and certain abstract principles are discussed. Here, again, we may remark, Mr. Bucknall's rendering is as clear and as idiomatic as a translation can be. Lecture VIII. opens with an inquiry into the position of the architect—why it is the training he receives has not realised the demands of our day. Viollet-le-Duc asks, "Have we reached such an incurable stage of decline that we cannot hope to see architecture free itself from the rut in which it has been dragged along? Are we reduced to the necessity of copying the Romans very badly—the Greeks after a fashion which to those acquainted with Greek architecture must seem puerile—the Middle Ages, the Renaissance, the age of Louis XIV., and even the poor buildings of the close of the last century, and to return once more—because we can do nothing better—to the Romans, and recommence the cycle of imitation?" Such a question, forsooth, has been asked again and again within the present generation of architects among ourselves, and here is the greatest French architect asking it among his own countrymen. The answer he gives is significant, and points to a solution we have constantly maintained in this journal. "No," he says, "decline is not absolutely inevitable; the evil is not without remedy; but it is high time to consider the state of things, to make use of all the vital elements that are still at our command, to quit the mere interests of the schools, and to devote our attention entirely to the great interests of an art which has always been considered, in the case of every people, the most striking expression of its civilisation." He goes on to say the whole field "must be subjected to intelligent scrutiny," and that we ought not to ignore the popular judgment—that we should be wise to accept that judgment as sovereign, for the sufficient reason that we build for the public, which makes use of the buildings, and pays for them. We are to enlighten that judgment, not to conceal the art we practise, as many among us would do, making it a kind of freemasonry, an incomprehensible language, an inscrutable dogma. The author, undoubtedly, here strikes a great stumbling-block to progress, and exposes one of the narrow and selfish ideas of professional class bias. Some architects go even so far as to avoid the enlightenment of their own ranks and the public, by refusing the publication of their works. The author observes: "In an age such as ours, when new ideas are daily brought to light, and when all things—even the very foundations of society—are subjected to discussion, one thing alone remains unshaken—the inscrutable dogma of architecture, guarded by a mysterious Arcopagus." The clamours outside for an architecture conformable to the age are unheeded, and the areopagus exacts from its adepts a "submission blinder as the multitude without are noisier." In France, the Government, who care not for art, are willing to give their allegiance to the guardians of these art mysteries, just the same as in England, the leaders of fashionable society adopt the taste and sentiments of Mr. So-and-So's style—be it Queen Anne, Dutch William, or anything else. It is not difficult to assign a cause for this state of things. In France, as Le-Duc

observes, the State provides a system of education for the architect which only enables him to design according to a programme, and holds out to the young aspirant of art, as a reward to his slavish submission to precept, a journey to Rome or Athens to enable him for the hundredth time to copy a Colosseum or a Partheon. In England, we may add, the young architect's training is quite as submissive to academic rules. Our own Institute's best reward is a travelling studentship, circumscribed to the study of mediæval buildings. Thus, between academical oligarchy, and the confusion of unmethodic training, the architect and the public vainly look for what they want. We have often, in these pages, pointed out the only paths by which architecture can be learnt. Every day we find the acknowledgment becoming more unhesitating that, if the art is to be learnt as it was of old, it must be imparted as a science by a method in which principles and not mere growths or results are inculcated. The *modus operandi* of the old workman has been completely ignored in the results of his labours. Viollet-le-Duc argues, "Since architecture belongs almost as much to science as to art properly so called, and as its conceptions are very largely dependent on reasoning and calculation, it must be allowed that design is not the result of a mere process of imagination, but is subject to *rules* methodically applied, and that it must take account of the means of execution, which are limited." Quatremère de Quincy, another authority, says, "The study of design should be something more than a mere imagining on paper of the several parts of a plan commending themselves to the eye on account of their variety and symmetry, or of elevations that seem to promise effective combinations or novel outlines and aspects." The architect's attention, he observes, should be "constantly directed to the means by which his designs are to be realised." The elements that affect his design must be taken into the architect's account, and the conditions of requirement, site, materials, and expenditure must be complied with. We are told that, in the domains of letters, painting, and sculpture, the appeal to the public is *bonâ fide*—there is no intermediate authority, no monopoly or ostracism; but with the architect the Villa Medici is all paramount, and woe to him who designs without its walls. Viollet-le-Duc is one of our ablest denouncers of the art *coterie*; he shows what would be the effect if the French Academy had the power to hinder the publication of certain new ideas, if it could compel the world of letters to express only a restricted number of authorised conceptions. Would such an espionage be favourable to independent thought? Certainly not. A current opinion is combatted that artists have not a practical mind; and the author shows that a genuine school should derive all its influence from "discussion; exchange of ideas and the emulation arising from rival principles freely manifest themselves under public opinion." It is fair to observe here that the author speaks rather flatteringly of the English school as prompted by more liberal principles—that, while the French architects are restricted by academic rule, the architects here and in Germany are gleaned everywhere, studying the methods of France, Italy, and Greece. This opinion, though generous, is scarcely correct. We are certainly less trammelled by academic teaching than our French brethren; it is true we glean from all sources, but it is also true that art cliques or coteries hold a monopoly. In France the tendency is undoubtedly towards mediocrity; in England it is towards individualism.

The object of the lecture before us is to interpret the architectural programmes of

different epochs. Though the main features change but little, climate, custom, tastes, and other conditions impose variations. Thus, in a theatre, the auditorium, the stage and orchestra, entrance and exit, are as necessary now as they were in the Athenian civilisation, but manners and customs have imposed an essential difference in the arrangements. In the ancient playhouse scenic representations took place in daylight—with us at night. Modern appliances for stage effects, stalls and boxes, and other details of modern histrionic art have also caused the programme in the latter case to be differently interpreted from the former. Hence the two buildings are different. There is a basis that varies but little, and a form prescribed by the habits of the time; the latter has to be expressed and not made to fit certain architectural models. The usages of society are variable, and the arrangements made should be the outcome of them. Thus the author shows architectural design should be suggested, first, by the requirements of the case; and, second, by the habits of the time; and, this being so, it is a necessary inference that, as the first change but little, and the second are continually being modified, architectural forms must vary indefinitely. The author applies this principle to the Roman and modern hall. In both the window would be necessary, though the mode of lighting, the glazing, and whether it was to give light simply or to be an outlook as well, would suggest designs of different character. This theory in the main agrees with one we lately advanced in these pages, though we rather prefer the statement then made, that the change or variation arises, or should arise, from the modifiable action of modern requirements upon certain types or forms that have survived to our time. We believe this proposition contains the whole phenomena of architectural style, and to explain every illustration of Viollet-le-Duc. It is at least gratifying to know so eminent an authority, so thoroughly versed in all the epochs of architecture, and so critical an observer, has adopted a theory which we venture to predict the architectural historian of the future must unreservedly accept if he attempts to keep pace with those who can trace a law in the progress of nations. Conforming to the conditions laid down, it is shown that the architecture of the Egyptians and Greeks, Romans and Mediævalists, have left indelible traces in history. The Egyptian temple or palace is exceedingly simple, composed of a continuous range of departments with never more than one axis. Each part forms an approach to the next, and we have in succession a series of apartments, beginning with a court and ending with a sanctuary or terminal hall, which is always the smallest. The Greeks, although their temples were simple, displayed their art, instead of reserving the richest ornamentation for the interior. The Greek building is characteristic of a republic, not a theocracy. There are no palaces, but temples and public buildings. Again, the Romans, in their amphitheatres, thermæ, and basilicæ, which were essentially their own, adopt special arrangements. It is also pointed out that the Greek and the Roman systems of design were very different. The former paid little regard to the plan: with the latter it is the leading principle, and the architecture is subordinated to it. Viollet-le-Duc observes the Romans were not artists, but complied with the material requirements of their programme. This method is a sound one, and if we have departed from it, says the author, "it is because we are rather more of artists than the Romans were, and are ready to sacrifice our material requirements to satisfactions of a higher order." But, he observes, we wish to be

Greeks and Romans at the same time. We hesitate between the two principles, each commendable in itself, and we fall into the strangest contradictions. There is only one right method of design for us Western peoples of the nineteenth century, says Le Duc, that is, "to comply with the conditions of the given programme, and then to make use of what we know to find a form for all the requirements imposed by the habits of our time—a form beautiful and durable." That form must be the simple expression of a necessity. As each part of a building should have its *raison d'être*, so these parts should be intimately related, and the author justly recalls the difficulty of subordinating from the thousand forms presented to view—in fact the *embarrasement de richesse* which the architect has to contend against. This embarrassment compromises the work, and it loses character; hence the value of fixed principles and method. In fact, the greater the number of heterogeneous elements the stricter the method should be. The author describes the absurd mode of French design in resuming Roman forms in utter defiance of the principles adopted by the Greeks, Romans, and Mediævalists, who varied their programmes; and he asks significantly what Frenchman of modern times would wish to inhabit a Roman house of the time of the Emperors? The academic prescription leads to all conceivable absurdities, and the question of adapting a building so designed is the *crux*. To fit a classic exterior, windows are cut through floors and partitions, stairs must be in the dark, galleries have to be lighted by gas at midday, closets are flooded with sunshine, and small apartments have to be "entresoled," that they may not look like wells. As for the exterior, we are told the architect does not take into account the effect of perspective, or has depended too much on the shadows cast on his drawing at an angle of 45°. The ancients, the Mediævalists, and the Renaissance architects were less skilful as draughtsmen, yet they studied the architectural effects in more practical ways than we do. Geometrical elevations were not relied upon, but their authors compared effects, and applied their knowledge.

Having shown that an architect should have a definite idea that he requires principles and a form to express it, Viollet-le-Duc enters into an interesting *résumé* of the subject of design, illustrating his remarks by reference to works of the Renaissance in France. We can only here briefly touch upon one or two of the leading positions of the author. Speaking of one class of designers, he says, very truly, they have taken a formula applicable to one style, regarded it as comprising the laws of architecture, and universal principles have been tortured to fit this form; eclectics belonging to a more liberal order have taken a wider range, but the preference leads to exclusion. On the other hand, the old architects worked from invariable principles; they had also a form, more or less pliable, appropriate to those principles. They thus had a single language, not several, as we have. The chateaux and palaces, such as Chambord, Madrid, Ecouen, and parts of the Louvre, show, our author maintains, a distinct art, though it grew up under Roman influence. This art was in perfect harmony with the time, because the old principles were followed out, and modern forms subjected to them, instead of contrariwise. The plans of the sixteenth century differ but little from those of the fifteenth, which, again, were but slight modifications of the thirteenth and fourteenth century arrangements. The idea was always accommodated to the time, and the architect seized a form, but always adapted it to the idea. As early as Louis XIV. this method was abandoned, and the

colonnade of the Louvre attests the change. Since this epoch architects reversed the order: they gave precedence to the form before the idea or the requirements of the day. It is thus the art is being led to its ruin, says M. Le-Duc, and an Academic precept has been substituted for a principle. It brings architects to a blind submission—a protective patent—or leads them into extravagant vagaries; it gives a handle to the advocates of the "practical," who thus see in works of art a useless and ruinous luxury, having interest for only a small section of society. We cannot too strongly enforce this latter view. The mediæval architecture of France in chateaux, hotels de ville, and palaces, show us an adherence to the principle we have mentioned. Thus, symmetry is approved of in churches, where unity of purpose preponderates; it is not regarded in a chateau, which is an agglomeration of dissimilar parts, each having a suitable form. By imposing a form this principle is sacrificed. In England, it is true, we have not reached this abject submission to outward formalism.

The common idea that the French Renaissance architects drew their inspiration from the Italian Renaissance, and that Italians largely constructed the French buildings of the sixteenth century, is refuted. These structures are not Italian in their plans, or in style or construction; the French Renaissance, in fact, it is shown, began as early as 1450, and in a form entirely French. It is contended, in fact, that the Renaissance was rather a continuation of the Roman organisation than a return to a forgotten system; and this view is explained by a reference to historical and ethnological facts, into which we shall not enter here; suffice it to remark that the great revolution of the twelfth century in France, the result of which was that the arts passed out of the clerical party into the hands of the laity (the Gallo-Roman races modified by the white races of the North), assisted in a return to the Latin arts.

Speaking of the requirements of architects, the author cites the treatise of Philibert de l'Orme, which enters into question of good aspect, &c. Some excellent illustrations are given—the Chateau of Boulogne as a primitive type of all the fine *maisons de plaisance* of the sixteenth and seventeenth centuries, and as showing no Italian influence. Here we have a central hall, or place of gathering, with its dais, suites of apartments, with wardrobes or boudoirs, and many of the traces of a feudal habitation. The chateaux de Chambord, of La Muette, Chantilly, de Charleval, and others, are instances inculcating the principles laid down; but we may return to them, as embodying one of the most interesting chapters of domestic architecture to be found anywhere.

THE RIGHT OF WAY.

THE law of easements is so intimately connected with building that any simplification of the subject will be hailed by architects and surveyors. Nice points of law and the decisions of judges upon them have tended to make obscure the general principles which should be borne in mind as the foundation of all easements of light, right of way, &c. We lately referred to the right of light, and in a recent number our "Legal Intelligence" (p. 67) contained an abstract of a nice point of law with reference to the effect of alterations in ancient lights in extinguishing the rights of the dominant over a servient tenement. In this instance, the National and Provincial Plate Glass Company v. the Prudential Insurance Company, Mr. Justice Fry explained the law, and decided that the mere enlargement

of a window did not operate as an abandonment, but that the principle of the decision in the well-known case of *Taplin v. Jones* held with regard to windows which had been put back. Mr. James Ball, in his "Monthly Law Tract" for the present month, treats of another very important easement, known popularly as the right of way, or the right which gives the person the liberty of passing to and from his own land over the adjoining land of another. This right may be a general road for all purposes, or it may be restricted to the user, for foot passengers, or for persons on horseback, for waggons, or for some special class of conveyance only. When a right of way exists without reservation, it is intended as a right for all purposes. This right, as that of other easements, is obtained (1) by express grant, (2) by prescription or undisturbed enjoyment, or (3) by implication, meaning an implied grant. An implied grant is generally obtained when one grants a piece of land to another which is surrounded by other lands of the grantor, it being presumed that a right of way over some part of those lands is granted at the same time. It must be remembered, however, that unity of possession of the dominant tenement and that over which the right passes or the servient tenement destroys the right; but a way of necessity is not extinguished, but only merged, by unity of possession, and on a subsequent severance the dominant and servient tenements would revive. A right by express grant means by deed which defines the extent of the right, or which is generally supposed to do so, though it is necessary to point out that a general conveyance sometimes makes it doubtful whether, on the sale of one property, a purchaser can claim a right the owner had made over his own property. In a case referred to, *Thompson v. Waterlow*, a way had been made by the owner of two properties to and from one over the other; on the sale of one of these properties the purchaser claimed this way, although he had another way to the land purchased. The claim was not granted. The "right," in fact, is merely the user by the owner of his own property. If the way was one of necessity which existed before the unity of possession, the purchaser would have been entitled to the revived right. A right by prescription is a right founded upon usage or an uninterrupted period of years. By sec. 2 of 2 and 3 Will. IV., cap. 71, forty years' enjoyment gives an absolute right, while twenty years' establishes a right, if there be "nothing to rebut it other than the fact of its having first been enjoyed within remembrance before the twenty years." Previous to this Act it was necessary to show uninterrupted enjoyment during the time of legal memory—a rather difficult thing to establish, considering that it went as far back as the accession of Richard I., 1189. Of course, in rights of this kind, the user of the right is the only evidence required. The third kind of easement, as we have said, generally arises from a "way of necessity." Thus, if the owner of two pieces of land having no way to one but over the other, should grant one of them, without reserving to himself the right of way, it will by the operation of this law be granted to him. Where land is granted that is surrounded by other land, the grantee, since he must have a way to his close, has an implied grant over the grantor's land.

Speaking of public rights of way, the author points out that they may be, general or special, entirely dedicated to public use as a public highway, or with certain limitations or restrictions. There are one or two important cases of operation to be remembered. Thus, an owner of land, by permitting the passage of persons over his land, without any visible mark, is presumed to have dedicated it to the public; but any

obstruction in the manner of posts or chains, even though persons might easily pass over or under, or the stationing of any one to warn the public off, is sufficient to rebut such presumption of the intention of owner. In the case of *Poole v. Huskinson* the law was stated thus:—"In order to constitute a valid dedication to the public of a highway by the owner of the soil, it is clearly settled that there must be an intention to dedicate; there must be an *animus dedicandi*, of which the user by the public is evidence, and no more; and a single act of interruption by the owner is of much more weight upon a question of intention than many acts of enjoyment." To establish a public right by prescription three or four years' enjoyment has been held sufficient. When a person or owner allows a way over his ground, but does not wish to dedicate the right of way to the public, it is customary for him to close or stop the way once a year either by a gate or hoarding; this indicates the intention. Obstruction is a frequent source of litigation, and the principle upon which the law acts is, that whenever the servient owner obstructs a way the dominant owner has a right of action against him for the obstruction; but no capricious objection on the part of the dominant owner to an alteration of the way by the servient owner by building upon it is entertained. It would be manifestly unjust to give the dominant owner an arbitrary power, such as would entitle him to make his easement a burden on the servient owner. After all, an easement is a convenience the dominant owner has over the land of the servient owner. Other points are found clearly stated in Mr. Ball's little treatise, such as that the owner of a way has a remedy against several persons collectively when their united operation amounts to obstruction, though he may not be able to define how far each is liable; that the servient owner cannot diminish the way so much as to interfere with the dominant owner's enjoyment; the right of the dominant owner to deviate from the way in case of obstruction by the servient owner; the repair of way, way over level crossings, injuries to ways, &c., and we recommend Mr. Ball's elucidations on these important points to the attention and study of our readers generally. The cases cited are ample and sufficient, and the author follows the law as laid down in the leading decisions.

LEAVES FROM A SKETCH BOOK, A. A. EXCURSION, 1876.—II.

CONTINUING our jottings of last year's excursion with the Architectural Association into Hampshire, we publish to-day four sketches selected from those made on the two days of the excursion week, which were devoted to visits by carriages to some rather remote villages whose chief points of interest architecturally were their usually small but nevertheless interesting parish churches, such as those which we illustrate to-day, and which may be taken as fair examples of the district. Generally speaking the excursion as a whole, and the week's arrangements in particular, have already been recorded both here and elsewhere as successful throughout, but probably no part of the programme was more thoroughly enjoyed than the Tuesday's and Thursday's outings on the top of two four-horse drags. Nothing, certainly, transpired worthy of special remark; neither was anything seen save Romsey Abbey which can be recorded as of particular architectural importance, and further it cannot be said that any extraordinary work in the way of sketching or study was effected. Notwithstanding, and perhaps in consequence of, these circumstances, every one seemed thoroughly to enjoy himself, and voted the days spent on the coaches "the best of all the seven," while the weather during the whole excursion was everything that could be desired, not forgetting the showers of the concluding day, which served

to temper the "sweet sorrow" of parting. The trip of Tuesday included Ashley, King Sombourn, Romsey, and Hursley, all of which lie to the west of Winchester. Leaving the "Royal" rather before nine, with a fresh team, at a sharp pace, skirting the old Roman road to Salisbury on the left, and past Weeke and Lainston, Ashley was reached by ten. Here the church (St. Mary) is of no considerable size; it is covered almost with thickly-grown ivy, and occupies a most secluded site, surrounded with trees. Inside, the chief feature of interest is the small chancel arch of Norman character. It is of only 4ft. span, with a height of but 6ft. 6in. to the top of the impost cap. At a later date two openings were made on either side of the central opening. A quaint alms-box, cut out of a solid post, still remains at the end of one of the pews. It is of seventeenth-century date, and has an opening far too small for the charitable dole of a modern copper. The belfry is inhabited by a colony of owls, whose long acquaintance with the bells has rendered their noise no longer an inconvenience. The vicar of the church here, as in most parishes, received the party, and, after describing the points of interest, very kindly introduced his guests to some welcome refreshers from his cool and doubtless well-stocked cellar. With three cheers for this hospitality the horn announced a start for King Sombourn, which was reached as the bells in the tower struck eleven. King Sombourn, or Somborne, or Somborne Regis, is a pleasant village on the east side of the Test Valley, and is seven miles north of Romsey. The parish was part of the ancient demesne belonging to the Crown previous to the Conquest. John of Gaunt, the celebrated Duke of Lancaster, had a palace here, and tradition is supported by the remains of a large mansion at Place Farm, where there are many yew trees, which were assiduously cultivated at that period for the use of archery; and about 100 yards from the church is a bank of earth, supposed to have been an archery butt, while at about half a mile distance the remains of a fishpond are to be seen. The park is still held by the Duchy of Lancaster. The Roman road already mentioned crosses the parish. The church, of which we give a sketch from the S.W., is dedicated to SS. Peter and Paul. The sacred building is in a greatly dilapidated condition, full of weather stains, whitewash, plaster, and high-backed pews, at once forming a fitting subject for the protective arm of the new Anti-Restoration Society, and well worthy of a graphic description, *à la Stevenson*. To an architect there is not much of interest in the church, save its severe picturesqueness and the few points of detail. The nave has Trans. Norman work, and there is a good Decorated window in the chancel; while a sepulchral recess in the sanctuary under an ornamental ogee arch demands a line as the founder's tomb, of fourteenth-century date. The picturesque tower is of wood, and contains four bells. The living is worth about £700. The churchyard was enlarged in 1852, and the parish schools were built in 1842, and enlarged in 1857. Several poplar trees enrich the landscape, and some are seen in our view. Following the valley of the Test, under the chalk hills on a high road commanding a fine view of the country to the right, a drive of some seven miles brought the Abbey Church of St. Mary, at Romsey, into sight. The church alone remains of the monastery, which was founded in the tenth century for Benedictine nuns by Edward the Elder, whose daughter Elfelda was the first abbess. The Abbey Church of "Romesy," as it is called in "Domesday," was described in our article of last year, and as the sketches made here are not included in our list to-day, we will pass the building for the present, simply recording the hospitable welcome of the vicar, Mr. Berthon, whose garden was the rendezvous for luncheon, as well as a 4 o'clock tea. It must also be mentioned that Mr. Fowler, F.R.I.B.A., Mayor of Louth, and who also formed one of the party, described the church at Romsey at some length, with the kind co-operation of the vicar, who himself is a hard worker in the work of restoration, which has been going on for some time under his direction. At half-past four a start was made for the return journey, when, after a six miles

ride, a flying visit was made to Hursley. The church (All Saints) is a modern structure from the designs of Mr. Butterfield, who rebuilt it in 1848, excepting the tower, at a cost of £6,030. The interior is described as being "neatly fitted up and enriched." The chief interest of the place, of course, is found in the visit one makes to the grave of the saintly John Keble, who was for many years the vicar of the parish. His well-kept graveyard and church formed a striking contrast to some which we had not many hours before visited, and thus concluded our Tuesday's work by reaching Winchester in time for a seven o'clock dinner.

On Thursday the duties of the day carried us to the east of the Mother City, along the Valley of the Meon, and over the highlands on the way home. The programme included the parishes of Cheriton, East Meon, Warnford, Corhampton, and Meon Stoke. Cheriton is a large village well situated on one of the branches of the Itchen, seven miles east of Winchester. The church, which is dedicated to St. Michael, is an interesting building, containing some good Early English work. The arcade and chancel arch are fine examples of their kind, though the western end of the church was destroyed by fire and rebuilt about the middle of the last century, including the tower, which is finished in brickwork. The chancel has been restored partly, and contains some curious old encaustic tiles in the pavement of the sacarium. We cannot refrain from remarking the mean character of the altar table of this church, by far the least worthy of any we have seen for many a long day, not excepting Warnford, to be mentioned farther on. The chancel here has a priest's door, and an interesting window of rather late character adjoining, and shown in our view. The souls in the parish are about 700, and the living is worth about £1,192 per annum, and is one of the most valuable in Hants. The Battle of Cheriton Down was fought in the parish during the civil wars of the seventeenth century, and relics of this fight are now and then discovered even to this day, while traces of the entrenchments are still visible. Adjoining is the small village of Tichborne, the occasion if not the site of a more recent and equally notorious though rather different battle, culminating in "the atrocity which vanquished the heir of 'De Itchen Bourn' to languish on the plains of Dartmoor." Tichborne House, which stands on the east side of the valley, in a beautiful park, is a commonplace brick structure, erected in 1803, when the ancient house was pulled down. The "Tichborne Dole" is still continued to the better villagers of the neighbourhood. East Meon was next reached. The church (All Saints) is an exceedingly fine example of Early work, chiefly Norman, though it has been restored. Mr. Christian was the architect. It was built by Bishop Walkelyn in the 11th century. The structure is worthy of a detailed account, and a larger sketch than we can at present give, so that we must leave it with the hope to return. The country here is exceedingly beautiful. Warnford Church is situated in Warnford Park, where a rather rural lunch was obtained under the trees, which abound. In the park are the ruins of St. John's House, commonly called King John's. The ruins are 80ft. long and 54ft. wide; the walls are 4ft. thick, and are constructed of flint set in "grout." The ruins are marked on maps dated as early as 1610, and in writings of a much earlier date are noticed as the "Old House." Close thence the remains of the original church. The present building stands some twenty yards from these ruins, and for all that has been said to the contrary seems to occupy the ancient site. The church is very mixed in character, and has a seventeenth-century tower of brick, Jacobean fittings inside, and a large sculptured tomb in the sanctuary. The chancel screen is a curious mixture of post-Reformation date, but has good balusters. The interior of the church is squalid, and savours of anything but cleanliness, which, they say, is usually attendant upon godliness. The heating apparatus would disgrace the common greenhouse of a poor vicarage; to say nothing of those to the mansion in the park adjoining, where everything at once establishes a conspicuous contrast. The living is worth not less than £500 a year, and the

rectory house, which is said to be "large and handsome," was built in 1810 at a cost of £4,000. The parishioners enjoy the dole of £2 a year out of Amery Farm at Alton, left by one John Knight in 1617. Corhampton was next visited. The parish church, whose dedication is unknown, is one of the earliest in England, and is among the finest examples of Saxon work extant. Our view is taken from the N.E., and a sketch of the impost of the doorway on the N. side is given. The same view was made by Owen B. Carter, and is engraved in Rickman's "Attempt," where, owing probably to the engraver, the work is barely shown correctly. The church stands on a mound, sloping rapidly away on each side, except to the south, where the churchyard lies. The east end is of modern brickwork, date 1837 and '44, else the building remains with its Saxon work undisturbed. The long and short work on the exterior is in excellent preservation (see our sketches of Sompthing Church, Sussex, published in the BUILDING NEWS, Jan. 26, 1872), and the north entrance, now blocked up, with its moulded impost and bases, are worthy of special remark. A square base course is carried round the church, and the south porch, though covered with ivy, is rather modern. The vestry is the effort of a local workman in brick and Portland cement. Inside the cleanliness and appropriate treatment of the building was refreshing after what we had seen. The chancel arch is very narrow, with a projecting key-stone and square arch mould. The font is a plain bowl, with twisted wreath around. A fine yew tree flourishes in the churchyard, and is probably 1,000 years old. St. Wilfrid, who converted the "Meonware" in the seventh century, most likely built the original church here, as it is known he did at Warnford. The living, a perpetual curacy, is named as being valued below £50 per annum. Within a stone's throw almost from Corhampton is the church of Meon Stoke (St. Andrew). The manor is called "Menes," or Mene-stoches in Domesday Book, and is recorded as having a church, two mills, and a wood of 40 pigs. The village stands at the mouth of the Meon, which gives the names of East and West Meon, the hamlet of Meon, as well as Meon Stoke, and shows the locality or country of the "Meonware"—the Jutish settlers mentioned by Bede. The church has been recently restored, and is well kept. The east window and niches in the church are probably the work of Wykeham. The clerestory is now hidden by the roof. The nave arcade is of good Early English work, and the font is curious. Two ancient coffins remain—one is of Purbeck marble. The vestry is a mean and debased structure, as will be seen by our sketch herewith; but it must not be forgotten that we were refreshed with some rare good sherry within its sacred walls. In the lower part of the churchyard is a curious sort of stalactite formation, specimens of which are preserved at the rectory. A similar process continues in the neighbouring stream—the water of which encrusts things lying in it with a coarse stony deposit. But our space has already been overreached, and we conclude our brief account of the day's trip with the most pleasant of memories. Winchester was reached again by six o'clock. M. B. A.

THE KENT ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the above Society was held on Wednesday and Thursday in last week, the visitors assembling at Ramsgate at 11 o'clock on Wednesday, when, after the transaction of the usual business, a move was made to the carriages, which were quickly filled, and the excursion commenced. The first halt was made at St. Lawrence Church, the architecture of which was explained by Mr. J. P. Seddon. Several interesting features were pointed out by the vicar and rural dean, and the Rev. Canon Scott Robertson, especial reference being made to the brasses and memorials, and the stained glass windows, one of which, of Irish manufacture, was stated to be of a remarkably good light and colour. After a very brief stay the drive was resumed, Minster being the next place visited. Here the company assembled in the parish church, and listened to a paper read by Canon Jenkins, who dealt

mainly with the uses to which that building, with others, was formerly devoted. The various styles of architecture contained in the sacred edifice were subsequently pointed out. From the church the party proceeded to Minster Abbey, which had been thrown open by the owner, and here also some interesting relics of early architecture were examined. After a shower the explorers passed on to Nash Court, where a subterranean passage was entered by a large number and examined. From Nash Court the route lay by Salmeston Grange, where Mr. Potter had made hospitable provision for the entertainment of his visitors. Here were found the remains of a small but very complete set of monastic buildings, probably an offshoot of the great college of St. Augustine at Minster, the site of which was pointed out earlier in the day, and a history of which was included by Canon Jenkins in his paper read at the church. The chapel at the Grange, now used as a barn, having been looked over, and its salient features explained, the party passed on to St. John's Church, Margate, which was restored about two years since, but which still retains many relics of bygone ages. The miscellaneous character of the windows, and the numerous and interesting brasses and monuments, especially that of St. Imar, the founder of the church, were pointed out by the vicar, the Rev. W. Benham.

Shortly after five o'clock nearly two hundred ladies and gentlemen dined at the Foresters' Hall, Margate, under the presidency of the Earl of Darnley, who, in proposing the toast of the evening, "The Kent Archæological Society," observed that the society was now in its twentieth year; it was just passing out of its teens and would soon attain its majority, and during the time of its existence most places of interest in the county had been visited, an opportunity being thus afforded to the members to examine interesting spots under the best possible guidance and advice. Various investigations had also been made under its auspices—for instance, at Sarre, in the Isle of Thanet, the society had discovered no less than 272 Saxon graves; and investigations of a similar nature had been carried on at Byfleet, Richborough, and Reculvers, while near Canterbury they had found, and brought under the notice of the Ordnance Department, traces of an old British entrenchment. The company then adjourned to the Church Institute Rooms, where a temporary museum had been formed. Here were exhibited numerous relics of the past, the contributions including a very interesting collection of curiosities—viz., Minster old church clock, a spinning-wheel, a Roman urn, a man-trap, books, a number of old coins, &c., sent by Mr. R. Bubb, of Minster; a number of tracings of brasses by Mrs. Edwards; an assortment of old china, by Mr. H. J. Cotton; books and deeds by the vicar, Messrs. K. W. Wilkie and C. J. Richardson, and the Revs. G. W. Sicklemore and J. H. Carr, and others; pictures and views by Dr. Richardson and Mr. E. White; needlework by Miss Williams and Mrs. Goodson; and embroidery by Mr. D. Swinford, of Minster Abbey. Numerous other articles were also on view, and the collection was a highly attractive one. In the course of the evening, papers were read by Mr. R. Hicks, on "Margate and its Records;" the Rev. Mr. MacLaehlan, on "Monkton and its Monks;" and by the Rev. Canon Jenkins, on "An Amusing Mediæval Pilgrimage from Laon into Kent, A.D. 1114;" and the day's proceedings terminated shortly after ten o'clock.

The assembly on the second day was at Cecil-square, Margate, at the hour of ten, and the start taking place thence shortly after the time appointed, a call was made at the two railway trains to pick up archæologists arriving by train. A fair commencement of the voyage of examination and discovery took place at eleven o'clock, and a string of carriages, whose occupants altogether numbered about two hundred, quickly defiled along the road in the direction of Dandelion Gate, the only traces left of an ancient baronial hall. The date of which is put at the reign of Henry IV., is in an excellent state of preservation—indeed the structure is so firm that the interior has been converted into a species of agricultural

store. After staying but a few minutes, the party was again in motion, and passing Garginge and Westgate-on-Sea a halt was made for the examination of Birchington parish church. The edifice, it was explained by the vicar, originally stood nearer the sea, but the fall of a cliff partially demolished it, and the remaining portion was removed to the present site. The earliest record is a brass put up to the memory of John Quex, and bearing the date 1449. From this village the party journeyed onwards to St. Nicholas-at-Wade, in the church of which may be seen some early English and Norman work, which has been faithfully preserved. Next a move was made to Chislett, and here at the vicarage the party were entertained by the vicar.

The final halting place was the coastguard station at Reculvers. Here are the remains of a Roman castrum, the history attaching to which is most interesting. The massiveness of the structure was pointed out and explanatory details were given by Mr. Dowker, under whose supervision the work of exploration at this spot has been carried on. Upon the site of the church, the two towers of which still remain, the party were assembled to receive further information as to the excavations which have been carried out, and also some facts forwarded by Mr. Roach Smith for their delectation. As the day was by this time far advanced the carriages were again called up, and the return journey was commenced.

THE PROPOSED FINE ART GALLERY SCHOOL OF ART, YORK.

THERE appears to be a little art dissension at York. About a year and a half ago a scheme was set on foot for the erection of a fine art gallery and school of art in that ancient city. An influential meeting was convened at the Guildhall, when a pen-and-ink sketch of an Elizabethan structure was exhibited and generally approved. This style was considered especially suitable, on account, we are informed, of the contiguous building being of that character—namely, the old palace of Charles I. Subsequently, a new idea was adopted by the executive committee, and its secretary, also the architect (Mr. Edward Taylor), prepared another design in the Italian style, which does not appear to have been publicly exhibited or approved by the guarantors. A lithograph, however, was prepared of the design. It has been submitted to tender, and the contract exceeds the estimated cost by about £6,000, the original estimate having been £13,000. At this juncture the committee called the guarantors together to ask what was to be done, and as this meeting was the only one convened since the previous and preliminary one, more than a year ago, the guarantors now, under a sense of indignity at the change, protest against the action of the committee, and will not sanction the expenditure for a plan they pronounce to be a poor one. We may well believe the guarantors felt aggrieved by the conduct of the executive, but the greatest point for consideration is the change of style. Having seen the last design proposed, we certainly consider there is some ground for complaint. The site selected is between St. Mary's Abbey wall and one of the city bars—a gate associated with historical incident—the same passed through by King Charles, and also by Cromwell—and we must at once protest, in the name of architectural concordance, to say nothing of historical association, against the introduction in such a locality of a building conceived in so opposite a spirit of design. We find the distance between the abbey wall and the intended building will be only 20ft., and the height of the wall is about the same. The front elevation towards St. Leonard's-place shows a centre with an arched porch and two projecting wings crowned by four meaningless turrets, having high pavilion roofs. To us these appear of rather nondescript proportions, being something larger than decorative features, and too small for any useful purpose. The centre or recessed part of the façade is relieved by a pediment and pilasters, though too superficial and decorative to give solidity to the front. The design certainly has more of the terpsichorean character about it; the panels

and niches in the front have a tawdry and flimsy appearance unsuited to the purpose for which the building is intended, and we advise the committee to pause before committing themselves to a design that appears quite unsuited to the locality. The plan seems to be tolerably commodious, but could be equally adapted to a style more in accord with the surroundings. On the ground floor there is a vestibule, central hall, and staircase (38ft. wide), and a hall for sculpture behind, on each side being the committee-rooms, the technical museum being on the left, and the school of art on the right side, these forming the side wings. A large exhibition hall, surrounded by a gallery with orchestra, occupies the rear of the site. The rooms above the museum and school of art are devoted to picture galleries, lighted from the roof, and a lecture theatre is placed over the hall for sculpture below. We trust the promoters will remodel their external design; by so doing they will be not only conceding an architectural point, but are likely to obtain more donations and subscriptions. We are also informed that Mr. Taylor, the architect, would not object to return to the Elizabethan design, and we understand the abandonment of that design is mainly due to the influence of some of the members of the committee.

MR. RUSKIN AND THE PROPOSED RESTORATION OF RIBBESFORD CHURCH.

AN adjourned vestry meeting was held at the Town Hall, Bewdley, on Thursday last, when the chairman referred to Mr. Ruskin's letter, which we reproduced last week from the *Kidderminster Times*, on the subject of the interesting traceries in the church, traceries which "no modern architect, no mason, either can, or would if they could, copy," and in a draft appeal to the public for subscriptions for the restoration it was remarked that "the greatest care will be taken to preserve these traceries as far as possible." The chairman said it was very good of Mr. Ruskin to take an interest in the church, and when the letter appeared in the *Kidderminster Times* he wrote to thank him, and asked if he could give them any advice as to retaining the old features he spoke of as so interesting. Mr. Ruskin wrote a very kind letter in reply—he did not know that he meant it to be published—and in it he said if he could be of any use in advocating the preservation of what was not hopelessly decayed he would very gladly help, and if the architect would consult him he would heartily support him. As his (Mr. Ruskin's) visits to Bewdley were not unfrequent, he would call on him (the chairman) when he was next there. The chairman said they must keep in mind that Mr. Ruskin had not before him the same end that they had. He was an enthusiast in church architecture, and the one object he had before him was to retain what might be very interesting in the old architecture, and he did not look so much as the committee should and must to the great necessity of providing a church suitable for public worship, and which would stand for future ages. He thought it would be very well if Mr. Preedy would consult with Mr. Ruskin as to preserving the old traceries, for, although they wanted a good and substantial church, they were anxious to keep what was old and interesting in the old building. Mr. Gardiner thought the committee ought to have a meeting and go to look at these old traceries. He did not know what they were. Mr. Bury said the traceries were the upper part of the windows—the moulding of the stonework. The peculiarity of them was that they were uneven. The sculptor had worked them without any rule but the rule of thumb, and they showed the cleverness of a man working without a precedent. Mr. Ruskin said no one could put them up again, and of course no one could, because if any one copied them he would go all wrong. The chairman said, if the stone was not too hopelessly gone, he did not see that there should be any difficulty in preserving them. The Rev. J. R. Burton moved that the thanks of the meeting be given to Mr. Ruskin for so kindly taking an interest in Ribbesford Church, and that Mr. Preedy be requested to consult with him as to the best means of preserving the traceries mentioned in Mr. Ruskin's letter, so

far as may be possible, without losing sight of the fundamental object of providing a suitable and substantial church. Mr. Landon seconded the resolution, which was carried. The provisional committee was re-appointed to carry out the restoration of the church, and some additions were made to the list of names. The estimated cost of restoration is £3,000, of which £1,000 has been already promised.

ARCHITECTURAL ASSOCIATION EXCURSION, 1877.

THE eighth annual excursion of the Architectural Association will take place from Monday next and throughout the week, concluding on Saturday, 18th inst. The following is the programme:—

Monday.—Warwick: St. Mary's Church and Warwick Castle.

Tuesday.—Snitterfield, Stratford-on-Avon, and Charlcote.

Wednesday.—Coventry: St. Michael's and Holy Trinity churches are to be visited under the guidance of James Fowler, Esq., F.R.I.B.A., of Louth. St. John's Church will also be visited, as well as Biblake's and Ford's* Hospitals, with St. Mary's Hall. The remainder of the time will be spent in examining the old houses and other interesting domestic buildings of the town.

Thursday.—Wroxhall Abbey, Knowle, Temple Balsall, and Kenilworth.

Friday.—Whitnash, Bishop's Tachbrook, Chesterton, Harbury, Southam, and Stoney Thorp.

Saturday.—Warwick: Leicester's Hospital and College School, with other examples of domestic work will occupy the day.

MEXICAN ARCHÆOLOGY.

MR. W. H. JACKSON, of Professor Hayden's Survey Corps, sends from Santa Fé, New Mexico, an account of the completion, in May, of the work assigned to him among the ancient ruins of that country. A number of ruined pueblos were visited in May in the parts between the Tunecha and the Jenarz mountains; the largest of them was 540ft. by 310ft. They are mostly built around three sides of a rectangle, with open court facing south, and enclosed by a semicircular wall; and three or four stories can be traced with rooms sometimes as large as 14ft. by 25ft., and 12ft. in height. In all the rooms there is a notable neatness of finish. A prominent feature is observed in the circular rooms, or "estufas," the council halls, or secret places for religious uses. One is over 60ft. in diameter. In speaking of the ruined pueblos, Mr. Jackson notices the remarkable skill with which the stone walls were built. This has enabled them to withstand for hundreds of years the ravages of human hands and the slower work of the elements. Commencing at the foundation, with a width of 32in., each succeeding story was built a little less in thickness, until the walls of the fourth floor are but 18in. through, giving them a pyramidal shape, and of such solidity that in some cases, although the floor has been crushed down and the cross-walls fallen, yet they remain firm and plumb nearly 40ft. in height. The builders had their methods of laying the stone—by regular sandstone blocks of the size of two bricks, cut and ground to a uniformity, by alternate layers of these blocks with layers of very small and thin pieces of sandstone, generally three courses of the thin to one of the thick, and last by laying the entire wall of these excessively small pieces of thin sandstone. Mr. Jackson measured off a square yard on the northern wall of the pueblo of Chetto-Kethe, and counted the number of stones forming the surface. There were 450, laid so close together that a knife-blade could not be pushed between them, and not a particle of mortar of any kind appearing at the surface. This entire wall was 490ft. long, and originally fully 40ft. high, and averaged 2in. thick. The interiors of these walls were laid in with rougher stone, and with abundant clay mortar. Binding courses of pine sticks were laid in the

* Ford's Hospital will be fully illustrated in an early number of the BUILDING NEWS.

wall both transversely and longitudinally. Every doorway and window was framed with scrupulous exactness, and it would appear as if the plumb and square had been faithfully used in all their work. Other things are noticed, the stairway shown in the rock, the great water pockets and cisterns, the human skull and bones found buried 14ft. beneath the level of the valley, and exposed only by the encroaching arroya. Photographs have been taken, and Mr. Jackson says he has brought away materials for 500 pictures, including groups of Indians in various occupations, and in their religious masked dances. He found scratched on a wall the name of Lieutenant Simpson, whose report in 1849 first brought some of these ruins before the world; and it is thought that, being far from all common routes, they had never since been critically examined.

AN ECONOMICAL BOARD.

IF it be an approved canon, in the matter of purchasing either services or commodities, to "get as much as you can for your money," the Hartlepool Port and Harbour Commissioners are fully entitled to whatever credit may attach to their acting fully up to the rule. The commissioners are in want of a chief engineer, and candidates are, on application to them, informed that the following, *inter alia*, are among his duties and qualifications: He will be the "chief engineer" of the commissioners; their "mechanical engineer" in so far as maintenance of their dredging plant is concerned; their marine surveyor, architect, builder, harbour master, general contractor, secretary, and accountant. He must be superintendent dredger, "accustomed to diving," and capable of taking charge of the light-houses, ferry, piers, &c. Whatever the etcetera may mean, he must have had experience in the construction of harbour and sea works, and in the manufacture of concrete blocks; and must be ready to design and carry out such new works, sea-walls, roads or what not, as the commissioners may from time to time require. His nominal salary is to be £350 per annum, and he is to find security for £500. If this security is in cash, it will be £25 in the pockets of the commissioners at 5 per cent., and £25 out of the pocket of their officer. Assuming that the security costs him nothing, the commissioners will have, in the wonder of the engineering world of whom they are in quest, a chief engineer at, say, £75 per annum, a marine surveyor at £50, a harbour master at £50; an architect and builder at £40, general contractor at £40, dredging master and concrete block manufacturer at £30, secretary at £50, and accountant at £25. These amounts make up the £350. Nothing is said in the conditions as to discounts and commission on materials purchased for the works, out of which the chief engineer, acting as contractor, may possibly be able to supplement his salary. On the face of the thing the commissioners are expecting a lot for their money.

New Board schools in St. Peter's-square, Leeds were opened last week. Accommodation is provided for 769 children. Mr. R. L. Adams (of the firm of Adams and Kelly) is the architect.

A notice appears on the doors of St. Dunstan's, Fleet-street, stating that a faculty has been asked for permission to make a road through the disused parochial cemetery so as to connect Chancery-lane and Fetter-lane.

The Town Council of Bootle have unanimously resolved to increase the salary of their surveyor, Mr. Buddle, from £160 to £200 per year. At the same meeting a special committee was appointed to consider the provision of a public recreation ground for the townspeople.

The Saffron Walden Town Council contemplate the erection of a new town hall, police station, and other buildings.

The St. Helen's Town Council received last week plans and estimates from their surveyor for the extension of the market, at an estimated cost, exclusive of land, of £12,170. This was considered too high, and the surveyor was requested to draw up amended plans.

The foundation stone of a new Roman Catholic church has been laid at Ancoats, Manchester. The building will be 70ft. long by 30ft. wide, and will seat 400 persons. Mr. J. L. Ward, of Manchester, is the contractor.

ILLUSTRATIONS.

CORHAMPTON CHURCH, MEON STOKE CHURCH, CHERITON CHURCH, AND KING SOMBOURNE CHURCH, HANTS—"BUILDING NEWS" CLUB DESIGNS FOR FONTS AND BOOKCASES—COTTAGES AT KILLERTON—ST. MARY'S CHURCH, MIDDLESBROUGH.

OUR LITHOGRAPHIC ILLUSTRATIONS.

COTTAGES FOR SIR T. D. ACLAND, BART.

THE illustration shows a plan of double cottages, now in course of erection on the east side of Killerton-park, Devon, the seat of Sir T. D. Acland, Bart., M.P. The walls of the cottages are of hollow construction of red brick, and the roofs, as well as the gables, are covered with dark brown tile. The whole of the first floor accommodation is provided in the roof. The design is by W. E. H. Harbottle, A.R.I.B.A., architect, Exeter, but the general arrangement of the plan is taken from Sir Thomas's own sketch designs. The cost will be about £400.

ST. MARY'S CHURCH, MIDDLESBORO', YORKS.

OUR illustrations this week include a large and important church, with extensive sacristies, &c., now in course of erection from the designs of Messrs. Goldie and Child, of Kensington-square, W. The presbytery adjoining has just been completed from designs prepared by the same architects, and with the church will form a striking and handsome group of buildings, occupying a commanding site in the principal thoroughfare of this large and important town. The design has been studied principally for the adaptation of bricks, which compose some of the principal features, and they also form the jambs and outer order of the five tracery windows which are in stone. The plan consists of nave, choir, and sanctuary, with aisles and outer aisles, terminated with chapels, baptistery, &c. The east end is flanked by sacristies and working sacristies, with a tribune, and rooms for the sacristan over, respectively. The organ-chamber, occupies space on the choir level, and the heating chamber arched over is beneath the working sacristy. The total length internally is 145ft., and the width across the double aisles 88ft., the length to the ridge being 67ft. The work is being well carried out by Craggs and Benson, of Stockton-on-Tees, contractors, under the superintendence of Mr. W. Watson, an able clerk of the works.

BUILDING NEWS DESIGNING CLUB—BOOKCASE, &c.

WE give this week a selection of the designs for these subjects, and refer our readers to our critical remarks thereon, p. 63.

CORHAMPTON CHURCH, MEON STOKE CHURCH, CHERITON CHURCH, AND KING SOMBOURNE CHURCH.

FOR descriptions of these illustrations see "Leaves from a Sketch-Book," page 121.

After vainly remonstrating with the local gas company, in reference to the price and quality of the gas supplied to the street lamps, the Romford Board of Health have resolved to invite tenders for lighting the lamps in future with either petroleum or gas. Petroleum has been substituted for gas at the neighbouring town of Barking.

COMPETITIONS.

BIRMINGHAM.—It will be remembered that the directors of the Midland Land Corporation, Birmingham, offered three premiums for the best designs for laying out the West Combe Park Estate, Blackheath, recently purchased by them. There were 52 competitors, and the plans, with sections of roads and drainage, specifications and estimates of costs, were exhibited at the Masonic Hall, Birmingham, last week, and the premiums were awarded as follows:—1st premium, 150 guineas, to "Invicta," Mr. John Ashdown; 2nd premium, 100 guineas, "Duo," Messrs. Isaacs and Florence; 3rd premium, 50 guineas, "Hic Labor," Mr. Robt. Keirle. Considerable labour and thought has been bestowed upon the subject, and the development of this beautifully wooded and undulating estate has been treated with an amount of skill and taste that reflects the highest credit upon the competitors. We are pleased to find the directors of the Midland Land Corporation fully appreciated this, and in making their award voted as an honorarium ten guineas to each of the ten competitors whose designs were considered to possess the most merit after the first three—a compliment which will no doubt be gratifying to those gentlemen in favour of whom this voluntary recognition of ability has been made. Their names are as follows:—"Respice Finem," Mr. A. C. Bean; "Model," Messrs. Bell and Roper; "Finis Coronat Opus," Mr. H. M. Cummings; "Civis," Mr. J. D. Matthews; "Quis," Messrs. Medland and Sons; "Supero," Mr. T. M. Nelson; "A Man of Kent," Mr. P. S. Punnett; "Finem Respice," Mr. H. W. Spratt; "South-Eastern," Mr. R. Walker; "Finem Respice," Mr. H. Webb.

LIVERPOOL.—The Committee of the Liverpool Eye and Ear Infirmary recently invited most of the well-known Liverpool architects to send in competitive plans for a new hospital. Eight architects responded. The general committee, having secured the assistance of Messrs. Paley and Austin, the plans sent in by Mr. C. O. Ellison were adopted, the premium being awarded to that gentleman. The plans provide accommodation for eighty-two beds, and six extra beds for private cases. The cubic space provided for each ordinary contagious case will be 960ft., and for ordinary cases 800ft. The cost will be £11,000. The elevations are effective, although ornamentation has been dispensed with. The tower, which forms the principal external feature, will be utilised as an air-shaft, and will mask the flues from the kitchens, and afford space for the necessary cisterns.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.—The Cambrian Archæological Association has this week held its 32nd annual session at Carnarvon. The inaugural meeting was held in Carnarvon Castle at 9 o'clock on Monday night; Prof. Babington, chairman of the committee, presiding. The excursions, which were limited chiefly to South Carnarvonshire, have been continued during the week. They commenced on Tuesday under most unfavourable circumstances. The original arrangement was for a division into three sections, the first to go by train to Llangybi and visit Llanarmon and Llangybi churches and the circular mound near Alfon Wen, the other sections going to Pwllheli to view Treiceirid, an old Roman camp on the seaside near Aberdaron, the cromlech on Cromlech Farm, Penyaer, and the Llanor inscribed stones—about three miles from Pwllheli. The heavy rain that fell continuously all day necessitated a complete change in the programme, and a party, barely over a dozen, including a number of ladies, started from Carnarvon for Pwllheli, the arrangements for visiting the Llangybi and Llanarmon districts being abandoned. On Wednesday, Dinas, Dinorben, Gadlys (a circular camp near Llanwnda station), Dinas y Pryn, Dinas Dinlle, Llandwrog Church, the manoir in Glynllifon Park, Lord Newborough's seat, Craig y Dinas (a strong post on the Llyfni), the cromlech near Tenbyedw, Clyrnog Church, St. Beuno's chapel and holy well were visited.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.—On Tuesday the annual meeting of this society was opened at Bridgwater, under the presidency of Bishop Clifford. After luncheon the visitors proceeded to visit the monuments of the town. A commencement was made at the Church of St. Mary, where special admiration was expressed at the splendid painting over the altar. The site of the castle and Blake's house were next visited; and then, amidst drenching rain, the party set off in open breaks for an excursion to Chisley Mount. On their way back to Bridgwater they stopped at Chedzey Church, the interesting features of which were explained by Bishop Clifford, the Rev. W. Hunt, and the Rev. F. Brown (Nailsea). The marks in the wall where weapons were sharpened during Monmouth's rebellion claimed some attention, and as the weather had cleared, the archæologists did not care to hurry back to their head-quarters. In the evening there was an ordinary at the Royal Clarence Hotel, and afterwards a meeting was held at the Town Hall, papers of local interest being read and discussed. On Wednesday there was an excursion to Athelney (North Petherton Church, in passing), Borough Bridge, Othery, Middlezey, and Weston Zoyland. Yesterday the members visited Cannington, the Park Quarries, Stoke Courcy Church and Castle, and Brymore House.

PARLIAMENTARY NOTES.

THE METROPOLITAN STREET IMPROVEMENTS BILL.—On Monday, in the Commons, on the order for the consideration of the Lords' amendments to the Metropolitan Street Improvements Bill, Mr. Fawcett moved to disagree to the amendment on Clause 4 relating to the proposed new street from Tottenham-court-road to Charing-cross. The objection to the amendment was that it placed the Marquis of Salisbury in an exceptionally favourable position in regard to that portion of his property which the bill affected, by enabling him to purchase back the frontages along the new line of street upon his own terms. Mr. Forster contended that the amendment was rendered necessary for the protection of Lord Salisbury's interests, but after an hour and a half's discussion the motion of Mr. Fawcett was put and carried without a division.

CHIPS.

The parish church of Conover is being restored under the care of Mr. Fairfax Wade, architect, of London, at a cost of £1,200.

The Masonic Hall, Birmingham, has just been decorated in colour by Mr. John Taylor, of that town, whose designs were selected in competition.

On Saturday, the postal business of Hull was transferred to a new building in the Market-place. The building is substantially erected, the walls averaging 2ft. 6in. in thickness, the front wall being 3ft. 6in. The area of the building is about 10,000ft. The architect is Mr. James Williams, architect and surveyor to her Majesty's Office of Works, London, and the builders are Messrs. W. and J. Hall, of Hull.

Messrs. J. L. Bacon and Co. supplied the heating apparatus, by high pressure pipes, of Holy Trinity Church, Wentworth, and not Mr. Barton, as stated by us last week.

Preparations are being made for the erection of Cleopatra's Needle on the open space near the Houses of Parliament; but before its erection the Board of Works are putting up a wood model, so as to get an idea how it will look.

Mrs. A. T. Stewart, the widow of the rich merchant of New York, is about to erect a cathedral at Garden City, Long Island, in memory of her husband, which is to be 150ft. in length, and 96ft. wide. The spire will be 197ft. high, and below the organ and robing-room a mortuary chapel and crypt will be prepared for Mr. Stewart's remains. There will be 13 bells.

Claridge's asphalt has been adopted throughout in the roof of the new Roman Catholic College of St. Francis Xavier, Liverpool, now being erected from the designs of Mr. Clutton.

The erection of the new Hotel de Ville at Paris was to cost, according to the first estimate of the architects, 16,209,521f. But since then important modifications have been decided on, such as constructing an exterior gallery to the Salle des Fêtes, improving the system of warming and ventilation, &c. These various works will cause an additional expense of 5,238,655f., so that the total cost will be nearly 21,500,000f., and that does not include the furnishing or interior decoration.

Mr. J. L. Pearson, of Harley-street, writes us to say that he is in no way connected with the restoration of Ross Church, as mentioned by us last week.

The new park recently given to the town of Barisley, by Miss McCreery, is to be opened by Lord Halifax on Tuesday next.

ROYAL ARCHÆOLOGICAL INSTITUTE.

VISIT TO HEREFORD.

[FROM OUR OWN REPORTER.]

IT was a happy selection of the Council of the Royal Archæological Institute of Great Britain and Ireland to fix on Hereford as the centre from which to work in the year following their very interesting visit to North-East Essex, for a thorough contrast is thus afforded the members between the areas consecutively explored. Each, it is true, is an agricultural district; each possesses much of the charm which attaches in the archæologist's mind to a neighbourhood that was once more populous and has seen "better days" than these; each neighbourhood is rich in fine churches, often too spacious for the present requirements of worshippers, in "choice bits" of castles, moated granges, and half-timbered houses; but from east to west in England is a longer stride geologically than geographically. In the centre of an upheaval of the old red sandstone, the ancient capital of Mercia, and the other towns about to be visited are built from the friable ruddy brown irregular fragments of rock quarried from or near their sites, whereas in East Anglia brick and flint affording the chief building material and detail, assumed a higher place in the conception of the designer than where larger masses have been available for working up. The scenery of the two districts exhibits in an equally striking manner the nature of the subsoil, the gentle, highly-cultivated, but very tame undulations of the banks of the Colne as clearly denoting the alluvial character of the county as the boldly picturesque forest-clad hills and vales, stretching away on either hand from the Wye, speak of the early period in the earth's history at which their strata were upheaved. Hereford opens out new ground to the Institute, although the city has been twice visited in recent years by similar societies—in 1868 by the Cambrian Association, and five years later by the British Archæological Association, and one or two of the excursions are planned on the lines laid down by those who arranged those meetings. To some of the visitors, therefore, the present meeting partakes of the character of a revival of pleasant memories of past excursions; still, much fresh information of interest to the archæological world has been ascertained since the last of those meetings, and to many members, of course, the district presents an entirely fresh field. With the many attractions of minster, abbeys, churches, and castles which the neighbourhood contains, the meeting at Hereford promises to be one of much interest to the members.

We gave last week the programme of proceedings, and further introductory reference is therefore unnecessary, except to repeat that the Bishop of Hereford (Dr. Attlay) occupies the office of president during the Congress, and that the sections are presided over by the following gentlemen:—*Antiquities*.—President: Sir William Guise, Bart., President of the Bristol and Gloucestershire Archæological Society. Vice-President: Rev. H. M. Scarth, M.A., Hon. Canon of Wells. *History*.—President: A. J. Beresford-Hope, Esq., M.P., D.C.L., L.L.D. Vice-President: Rev. John Jebb, D.D., Canon of Hereford. *Architecture*.—President: T. Gambier-Parry, Esq. Vice-President: J. H. Parker, Esq., C.B.

A FLYING PEEP AT GLOUCESTER CATHEDRAL.

Many of those coming from London, we believe, took advantage of the opportunity afforded them for visiting or re-visiting Gloucester, and for again inspecting its many and handsome churches, and of noting the variety in the treatment of their generally-fine towers of fourteenth and fifteenth century workmanship. The cathedral was naturally the centre of attraction, and the noble proportions of the central tower, which, together with the delicacy of its pierced pinnacles and open parapet, give character to the exterior, attracting attention directly the city bursts upon our view as we approached by the Great Western line. On entering, the massive Roman nave-pillars and the heavy triforium above, at once attracted the observer's eye; the effect of the two per-

pendicular bays, by which the nave has been extended westward, adds markedly to the solidity and vigour of effect of the earlier circular columns. The roof, we note, is of fourteenth century work, has been lowered in pitch, and the groining is now plastered. Giving a cursory glance to the Decorated aisle-windows, profusely adorned with the characteristic ball-flower ornament, we pass through one of the doors on either side of the heavy screen (which, by the bye, are vigilantly guarded by vergers on sixpences intent) into the choir and presbytery, and examine the richly-groined roof, striving to decipher the significance of the stories pictured on the bosses, now lavishly gilt and coloured, our necks suffering in the service of our eyes. Having looked at the great east window, and mentally compared its ancient stained glass with that with which the west window has been fitted since 1862, as a memorial of an ancient bishop, we pass through into the long Lady Chapel. The north and south transepts are Norman, recased in the fourteenth century, the former being much later in style and more elaborate in treatment. The works of restoration, we note, appear to be drawing, under Sir Gilbert Scott's supervision, towards completion; the contractor (Mr. Wallace) has now for some time been engaged merely on repairs; the great window of the north transept has just been rendered safe, defective stones in vousoirs and tracery being replaced by sound ones, and the west window at right angles is now enveloped in scaffolding for the same purpose. Before taking the Minster we pace the cloisters, which lie on the north of the nave—the most perfect in England: and here again the richness of the treatment of groined roof deserves more careful study than we can afford it, the fan tracery being not alone interesting on the ground of its intrinsic beauty and the skill apparent in the disposition of spaces and groining, but from the fact that it is the earliest example of its kind (commenced by Abbot Horton, 1351-77, completed by Abbot Froucester, 1383-1412). After a pleasant run by rail through the valley of the Wye, we reach the headquarters of the Institute Congress, feeling that a Bank Holiday has been pleasantly spent in gaining mental tone for a week of archæology.

TUESDAY.

INAUGURAL MEETING.

The business proceedings of the Institute's Thirty-third Annual Congress commenced at ten o'clock on Tuesday, when the Corporation assembled in the Woolhope Club-room, at the Free Library, to officially receive the members. The Mayor (Mr. Philip Ralph), who appeared arrayed in all the glory of scarlet and fur-trimmed robe, and chain of office, took the chair, and was supported by the aldermen and town councillors of the borough; the dean and many members of the clergy and magistracy were also present, in a representative capacity. The TOWN CLERK (Mr. Joseph Carless) read an address of welcome, in which reference was made to the facts that Hereford has a history dating back to the time of the ancient kingdom of Mercia, and that the see, of which it is the cathedral city, is now upwards of 1,000 years old, that its proximity to the marshes of Wales rendered it a place of importance during the troublous scenes through which England, in its earlier history, passed. The district included in the excursions offers, it was remarked, a large and varied field of research, and the Corporation looked forward to the Congress of 1877 as not the least successful and important in its results of the many annual meetings held by the Institute. Thanks to recent legislation, the address continued, the citizens of Hereford have practical proof of the connection between a municipal corporation and archæology in the existence of the Public Free Museum. To archæology are they indebted for a large and interesting portion of the collection, and to the archæologists must they look for further enrichment. In conclusion, congratulatory reference was made to the manner in which the ministers of all denominations identify themselves with literary and scientific societies, and to the fact that the bishop has accepted the office of President for the year.

The MAYOR having briefly welcomed the Institute to the city, and Mr. RICHARD HEREFORD, J.P., of Sufton Court, having expressed the pleasure which the county gentlemen felt at the visit of the Institute, Lord TALBOT DE MALAHIDE, F.S.A., as President, replied in the name of the Institute, thanking the Corporation for their hearty reception, and remarking that this was the first occasion on which they had, as a society, visited Hereford. He believed that they would gain much information from the visit to the county, and hearing papers read by the local gentlemen; at the same time the members hoped they might be able to aid them in interpreting their monuments by experience derived from wider fields. He trusted such gatherings as these would act as an incentive to all to resist any vandalistic attempts to injure or destroy the ancient buildings which are now coming to be esteemed with greater pride than was formerly the case. In concluding, he introduced the Bishop of the diocese as President for the year.

The BISHOP OF HEREFORD delivered an inaugural address, avowing at the outset his want of any special knowledge of archæology. Many of the clergy—and he might add Prebendary Scarth and Canon Jebb—were, however, ardent archæologists, as would be seen in the course of the week's excursions, during which, he could assure the members, they would find that the county of Hereford was not at all deficient in valuable architectural remains. As to their cathedral, they would that afternoon have the privilege of hearing one of the first archæologists and architects upon its history and character, and after visiting the building itself, under Sir Gilbert Scott's guidance, he hoped they would feel that there was in this county at least one building worthy of careful and diligent study. The Bishop then gave a running epitome of the principal places to be visited during the week, referring to the excursion fixed for to-day (Friday) as singularly interesting. Moas church and two others near by, again, were edifices of about Norman date, whether præ or post he should leave for the members to decide after an examination. The remarkable two-naved church at Leominster was one which needed and ought to be restored. Sir Gilbert Scott had already restored the Norman one, the other had been also entrusted to the same architect, and he trusted that one result of this Congress would be to stimulate the inhabitants of the county to resolve not only that the second nave be restored (perhaps as a memorial of the visit), but that a chancel should be projected once more from the east, so that Leominster may again have a complete church for worship. On behalf of the Dean and Chapter, he would say that the cathedral authorities would that afternoon and throughout the week cordially throw open their cathedral, and hoped it would exhibit points interesting those who devoted so much time, trouble, and money to the study of ancient buildings.

Lord TALBOT DE MALAHIDE thanked the Bishop for his address, and the members dispersed, meeting again at the *déjeuner* given by the Mayor at the Green Dragon Hotel, to which most of the members sat down. In the course of the postprandial speechmaking, the DEAN OF HEREFORD (the Hon. and Rev. George Herbert, M.A.) in proposing the health of Lord Talbot de Malahide said he hoped the members of the Institute would be able to assist the county clergymen by their advice not only in preserving their churches, but also in the more critical operation of restoring them.

The MAYOR, in closing the meeting, alluded to the great loss they had sustained in the sudden death last Friday of Mr. G. Townshend Smith, a leading member of the local committee for receiving the Institute.

Architectural Section.

SIR GILBERT SCOTT ON HEREFORD CATHEDRAL.

The architectural section was opened at the Woolhope Club-room at half-past 2, under the presidency of Mr. T. Gambier-Parry.

SIR GILBERT SCOTT, R.A., read a paper on "Hereford Cathedral," supplementing it by a peripatetic lecture delivered whilst accompanying the members round the building itself. In most cathedrals the difficulty in telling its architectural history arises from the plenitude

of information; at Hereford there is almost a nullity of information, and one has to search in every direction for excuses for guesses and theories, which in the majority one can neither prove nor test. Mr. Gordon Hills had, however, collected a nearly exhaustive summary of the documentary evidence for the British Archaeological Association; to it Sir Gilbert freely expressed his indebtedness, although he had not always been able to agree with Mr. Hills in his conclusions. There was probably a church of some importance at Hereford (then known as Fernleigh) as early as the days of King Offa, the great King of Mercia, for here in 793 the body of the murdered Ethelbert, King of East Anglia, was buried, and in 830 the church was rebuilt in stone; and again rebuilt in Edward the Confessor's time. This last cathedral was but short lived, being burnt in 1056 by Griffin, the Welsh Prince, who slew Leofgan, the bishop. To Leofgan succeeded, in turn, two natives of Lorraine, Walter and Robert. The latter, commonly called Lozing, was consecrated in 1079, and held the see 16 years. He undertook the reconstruction of the cathedral, and is said by William of Malmesbury to have built it of round form like the basilica of Charlemagne at Aix-la-Chapelle. The basilica exists, and is round (or rather polygonal) in plan like the Templar churches, being imitated from the church of the Holy Sepulchre at Jerusalem. Unfortunately no suggestion of a rounded building can be traced at Hereford, and, if so constructed, it must have been obliterated by Bishop Reynelm, who held the see from 1107 to 1115, whose reputed effigy holds in its hand a model of a church. Since there is no trace of a circular building, but merely of a church on a very straightforward Norman type of an advanced period, the presumption is that Reynelm commenced the rebuilding of the cathedral in the style of Normandy. All that is certainly known, however, is, that the Norman cathedral was finished not by Reynelm, but by his third successor, Robert de Bethun, who held the see from 1131 to 1148. The Norman design, which occupied about 40 years in execution (and of which Sir Gilbert Scott exhibited a conjectural plan), was a nave of eight bays, supported by massive round pillars, to which double shafts are attached both north and south, a triforium of moderate height and good design, and a somewhat lofty clerestory. The choir was beneath the central tower, and the presbytery beyond was of three bays, supported by piers, and are rather masses of wall than columns. It was probably vaulted — then rather an unusual feature in churches of so great a span — and terminated eastward in an apse, which was a separate and narrower structure opening into the presbytery by an arch of moderate dimensions, over which the eastern wall terminated in square form. Each aisle ended in a smaller apse, each having a separate roof. The transepts, of which one (the southern) remains, were of ordinary type. The nave was not conceived on so original a plan as its three neighbours, Gloucester, Tewkesbury, and Pershore, but he was not sure whether it was not more beautiful in internal effect. The details of the principal parts are decidedly rich in ornamental character, and of advanced type. The great glory of the cathedral was the west front, of which Sir Gilbert exhibited a restored elevation based on an ancient view. The east end seems to have been built by William de Vere, a great building bishop, between 1186-99. This work is very fine Transitional, with the rich semi-Norman decoration characterising the churches at Glastonbury and St. David's, but with other features derived from France. This eastern alteration consisted in the entire removal of the three apses, and the substitution of an eastern aisle, so affording a continuous ambulatory round the apse, with the addition of a range of chapels eastward. De Vere's scheme did not, I think, intend that these should take the form of eastern transepts, as they now do; one wide central, or two central, and four side chapels were aimed at, and this is confirmed, both by the base of a corner shaft on the south side, and by the remains of a Transitional doorway at the extreme end of the ambulatory. The fault in these alterations was the blocking up of the fine eastern arch of the presbytery; the re-opening of this arch is

a work of our own day, and has added much to the beauty of the choir. In the grand work of part of the thirteenth century the cathedral is rich, but every part has to tell its tale without the suggestion of a date. First in importance comes the noble Lady Chapel; a well-defined break in the internal work and the later character of the moulding and vaulting ribs, and the fact that the details are well-developed Early English militate against the idea that the chapel was commenced by De Vere and carried steadily forward to completion. It seems to be fine work of the earlier period of Early English. The presbytery clerestory is very advanced Early English, with windows filled with plate tracery. This suggested the probability that the original clerestory and vaulting had become damaged by the settlement of the central tower, again raising the question when the tower was first built. The style and details of the clerestory are very elegant, and it affords a perfect specimen of the later form of Early English. A second transition, from Early English to Decorated, is afforded in the north transept, the windows of which are adorned with bar-tracery of similar character to that at Westminster Abbey (which was begun in 1245), but rather later in date. The see was held from 1240-68 by Peter de Aquablanca, a turbulent prelate, who travelled for six years in the Holy Land, and was reprimanded by the king for his neglect of his duties. Though at first sight it seems unlikely that he could have built the transept, it is certain that he had a hand in it, for his exquisite tomb, which no one would erect to such a man but himself, is identical with the architecture around it, except in scale. Sir Gilbert suggested that the lower part of this transept was carried out by the chapter in Aquablanca's time, but that it was completed during the two succeeding episcopates, extending to A.D. 1288. Although the remarkable straight-sided arches are faulty, yet the transept as a whole is an exquisite architectural design, not surpassed by any of its period. The work here was probably continued by Thomas de Cantilupe, who, however, produced greater impression in his cathedral after his death than during his life, for, dying in Italy in 1282, Swinfield, his successor, pronounced him a saint, and his heart and bones were brought over to England—the former being buried at Ashbridge, and the latter in the Lady Chapel at Hereford; they were in 1350 removed to St. John the Baptist's aisle in this transept, but some sixty years later the shrine was removed to the Lady Chapel; there Leland saw it in Henry VIII.'s time, but in Elizabeth's reign Godwin saw it back in its present position in the north transept. There was in his mind no doubt that the singular canopied tomb, having on its upper slab of marble the matrix of a brass, was the base of Cantilupe's shrine. Sir Gilbert went elaborately into the reasons for this belief, adding that when Dean Mereweather removed the library from the Lady Chapel to the chamber above this transept, in 1842, he found the traces of where Cantilupe's shrine had rested, and the encaustic tiles, worn away by the knees of pilgrims; these are still preserved in the library. Bishop Swinfield himself appears to have finished off the top of the buttresses of the great north transept, the north porch, and the whole of the north aisle; these were executed in his earlier years, about 1288 or 1290. The south aisle is of the same date as the north, but less ornate, and both are much loftier than the Norman aisles they replaced. Swinfield seems at a later date to have rebuilt the presbytery aisles and the north-east transept. His own monument is in this transept, which first shows the profusion of the ball flower. About this period, or a little later, some bishop saw fit to commemorate all his predecessors by a series of recessed monuments and effigies arranged along the aisles of the presbytery. In 1320 the dean and chapter obtained from the Pope the appropriation of the titles of two Berkshire churches, on the ground that many superstructures had been built on ancient foundations, reputed to be firm and good, but which, in the judgment of expert masons and architects, were so weak as to threaten ruin, if not entirely renewed. These superstructures could only have been

the central tower and north transept. That a tower had formerly existed there can be no doubt, for there is evidence in the masonry that its weight caused the latter to give way. The present tower is of middle Decorated style, of singular beauty of design, and surcharged with ball flowers. From the style, it appears to have been rebuilt soon after the receipt of the Pope's bull, but entirely of fresh material. The stallwork and throne are somewhat later, but still of very fine work. Late in the 14th century, when the style had deteriorated, the south-eastern chapels were transformed into a transept. Not long afterwards, before 1375, were built the chapter-house and vestibule, in which a great revival of artistic taste is apparent. These were almost entirely removed during the Commonwealth, and several remaining fragments in 1841. Later works are rather those of deterioration than of improvement. Bishop Bisce clothed the interior of the east end with work, of which, judging from prints, even the Anti-Restoration Society cannot regret the loss. On Easter Monday, 1786, the western tower, an addition of the 14th century, fell, bringing ruin on the adjacent parts of the nave. James Watt was called in and designed the present western facade, probably the dullest piece of work to be found in any English cathedral, except perhaps the southern transept at Chester. He shortened the nave by one bay, and substituted for the triforium and clerestory of the nave a wretched design of his own. In 1840 Mr. Cottingham elaborately reconstructed the failing piers of the central tower, as well as the east end of the Lady Chapel; the nave arcades were also dealt with, and many unsuccessful decorations applied to the vaulting of nave and aisles. It would thus be seen that few cathedrals contain a more perfect series of specimens of the different styles of English architecture. Of the work executed since Sir Gilbert Scott would say nothing, except that he was himself responsible for it. When he refitted up the choir great stress was being laid by writers on the suiting cathedral arrangements to modern requirements, and he therefore limited the choir to the eastern limb, introducing an open instead of a close screen. He was not sure that he should do so were his time to come over again, but he believed that the uses of the cathedral had gained by it.

During the examination of the cathedral, under Sir G. Scott's guidance, a close inspection was made of the reputed shrine of St. Thomas of Hereford (Bishop Cantilupe), now for the second time placed in the north transept. It was suggested that the upper portion—a marble incised slab, supported canopy-wise on grouped columns—was of later date than that below, and as some of the details seemed coarser, it was suggested that this was an imitation made in consequence of the breaking of the original in one of its removals between the Lady Chapel and transept. The fact that certain fragments, apparently of the same tomb, are preserved, supported the theory, but a yet closer inspection showed that a small portion of one side of the upper part was of distinctly baser work, and was let into the main part. The problem yet remains at what date, if not a modern one, would Early English work have been so servilely copied? That the monument is the shrine there could be little doubt after an examination of the Templars' figures on its lower side, and the marks of the iron shrine above. The Rev. F. T. Havergal, canon and hon. librarian, at the request of Sir G. Scott, stated that when Bishop Swinfield's monument was restored some years since the side was broken in, and something shining was apparent. It was feared that the workmen might be tempted to rife it, so he had the coffin opened, and found the bishop's body in excellent preservation. By its side were the head of the pastoral staff, a chalice, and patten. These were removed. The staff forms the head of that now borne before the bishop, while the chalice and patten are preserved in a glass case in the vestry. Another bishop, Dr. Ironside, died in London in 1701, and his body was buried in the church of St. Mary Somerset. When that building was condemned a few years since, he thought the

bishop ought to be reinterred at Hereford rather than in the cemetery at Manor Park, Essex. On making application to the Board of Works for power to take the body, the parish clerk suggested that they wanted to get the silver coffin in which, tradition said, the bishop was buried. He obtained the sanction of the Board of Works to the removal, and with the pecuniary aid of friends, had the body brought to Hereford, and buried it under the old monumental stone. On opening the coffin (which was of wood, not silver), they found the skin unbroken, and the arms crossed. He had had many of the ancient monuments repaired, but there were yet two cartloads of tombstones buried altogether near the Bishop's palace. He had also copied all the tombstone inscriptions outside the cathedral, which must by degrees become illegible.

Acting on Mr. Havergal's invitation, many of the visitors ascended the narrow staircase to a room over the north transept, now used as the library. Here a rich treat rewarded "bookworms," for in narrow tiers and open shelves is arranged a fine collection of illuminated manuscripts and early printed works in an excellent state of preservation. Many of the volumes have still attached the chains by which they were originally chained to the desk; these are about 7ft. 4in. long, with the slender links of fine charcoal-tempered Forest of Dean iron, as tough as steel. Many of the manuscripts are richly illuminated on vellum, some dating in style from the earlier part of the thirteenth century, and even antecedent to that period. Amongst the printed works is a fine copy of Caxton's "Golden Legend," printed 1483, but we noted an earlier work—"De Proprietate Sermonis," imprinted 1476. A "chained Bible," a vulgate of the twelfth century, exquisitely written in red and blue, attracted much interest as a historical no less than antiquarian relic. Mr. Havergal stated that he should be glad to afford every facility to members to inspect the library throughout the Congress.

In the evening the members were received at the palace by the Bishop and Mrs. Attlay. During the evening a paper was read by Dr. BULL upon the "Herefordshire Apple and Cider." About 150 guests were present.

WEDNESDAY.

The first excursion of the Congress was arranged for Wednesday, the ancient boroughs of Ludlow and Leominster being selected for a visit by rail. The weather was so showery as to detract much from the enjoyment of the visitors, who mustered in great numbers, but the town presented so many features of interest that the inconvenience was but lightly regarded by the working archaeologists.

LUDLOW.

The hill of Ludlow, crowded by houses, above which rose the lofty square tower of the noble parish church, burst into sight on rounding a sharp railway curve about 40 minutes after leaving Hereford. When toiling up the steep ascent towards the Bull Ring, a performing bear suggested reminiscences of the days when the bull and bear were really baited on this spot, the quaint half-timbered houses, with overhanging gables and glaring white plaster and black quartering, making a fitting background to the mental scene of the Middle Ages. Churchyard's eulogistic description of Ludlow is fairly correct at the present day:—

The town doth stand most part upon a hill,
Built well and fayre with streetes both long and wide;
The houses such where strangers lodge at will,
As long as there the counsell listes abide.
Both fine and cleane the streetes are all throughout,
With condits cleere and wholesome water springes;
And who that listes to walk the town about
Shall find therein some rare and pleasant things;
But chiefly there the ayre so swete you have,
As in no place ye can no better crave.

The rain did not invite long lingerings by the way, and the members pressed on through the town to the great castle by which Ludlow has been most widely known. The widely-scattered ruins of old red sandstone buildings, the details and sharper outlines veiled in places by a mantle of ivy, creepers, wallflowers, and grasses, looked very imposing as we entered the Tudor gateway, and followed Mr. G. T. Clark, of Dowlais, as he escorted the party in a perambulation of its walls and pointed out the

places where the Norman work has been restored and raised and altered during later periods. The path, a very narrow one, along which the members followed their *cicerone*, lay on the outer side of the walls, and from it a steep bank sloped down towards the town and river Teme, more than a hundred feet below. On the face of the watch-tower Mr. Clark pointed out how a good Norman squinch window in the basement had been degraded in later days by passing a sewer pipe from the baronial hall through it, discharging on to the rocks below, and thus into the river—a mediæval example of sewer ventilation and disconnection by no means worthy of imitation. Having completed the town grounds, returning by the curtain to the principal entrance to the outer valley, Mr. Clark showed that this, together with the stabling to the left of it, was a Tudor addition to a Norman base. The plane of the ancient drainage between the outer and inner ward has been supplied by a modern arch of masonry across the fosse, but the line of the depending curtains to those sallying forth can be distinctly traced. The ditch appears to have been revetted in Elizabethan times. Having glanced at the arms of Sir Henry Sydney and the inscription, 1581, over the inner gateway, the members ascended a circular staircase to the principal floor of the keep, a T-shaped room, having a passage running north and south from the end of a rectangular passage. Some of the more active visitors ascended to the top, from whence, between the showers, fine glimpses were beheld of the surrounding hills and the intervening valleys. The principal entrance to the keep (now closed) is on the ground level, and turns abruptly to the left, passing up in the thickness of the walls, but a second, a circular staircase, was also provided at the other end, there not being the usual care displayed to prevent access. The roof Mr. Clark also showed, by the corbels and other traces, was so far below the level of the walls that its ridge presented no object to marksmen, but, on the other hand, the inmates could not plant military engines upon it. The bakehouse and capacious oven were viewed, and on the other side of the ward the baronial hall—an apartment of noble proportions, but, like all the others in the castle, now roofless and dismantled—and the buttery and retiring rooms on either side. In the inner side a Decorated window has been blocked up by a large Elizabethan fire-place. Between the hall and retiring room are the traces of a gallery, from whence the ladies of the household could look down upon the feasts or plays below. Most of the windows are a very early type of Decorated, and have what is very unusual in windows of that period, except in a few castellated buildings—transoms. The members then adjourned to the little circular Norman chapel in the centre of the inner ward. This is the nave of one of the "round churches," erected on the model of the Holy Sepulchre, and is roofless; the only features are the arches to the east and west sides, which are richly ornamented with the billet and zig-zag mouldings, and the blind arcading with which the inner wall is surrounded. Traces of the chancel are discernible on the sward, and it was suggested that its excavation would amply reward the explorer by showing whether it ended in a square or apsidal form. Having completed the examination of the castle, Mr. Clark delivered an address. Ludlow was, he said, a castle-palace, in which the idea of defence predominated over that of comfort or display in its arrangement. Its plan was admirably suited to its site on a steep promontory overhanging a ravine, being a quadrant, with its acute front on the face of rock next the river Teme. It formed one and perhaps the principal of the series of nearly 200 defences of the Marches, erected by the English for protection against the Welsh. Here there is no trace of earthworks or other remains of earlier than Norman date, although it is satisfactory to find that the Norman castle up to 1086 displayed the same lines as when reconstructed in the thirteenth and fourteenth centuries. The keep (which is that built by the Normans) was rectangular—a shape only adopted when no previous artificial mound was availed of, and one which has stood better than those of the more usual cir-

cular form. The prolongation of two passages into a T form seen here was a very unusual form. He had not shown the members the lower story because it was only used as a receptacle for filth, as in other castles, and was from time to time covered with sand to deodorise it. The bakehouse tower, near by, was open at the rear—a method of building paralleled in Cologne, Avignon, and other Continental walled cities, as well as Porchester, with the object of preventing a hostile force from holding the place against the denizens of the castle. The gate-houses were all Tudor, for the Norman architects rarely made more pronounced entrances than an opening in the curtain wall, and in most cases, as here, they had been beautified since. Those who were acquainted with the topography of the Marches of Wales would see that Ludlow was most advantageously situated as a dominating castle, being supported on either flank as well as occupying a very secure position. It was, therefore, a fitting seat for the Lords of the Marches, who once governed the Principality. The extraordinary legal powers and positions of these Lords of the Marches remained still to be explained. William the Conqueror found the Marches too much to manage, and though unwilling to part with any personal power, he was obliged to put Montague in possession of Ludlow, and other nobles were dispersed throughout the border-land of Wales, permission being given them to conquer and hold as tenants of the Crown. As a matter of fact, they acted each as sovereigns, and upheld the privileges of marrying, issuing writs and injunctions, &c., and even managing the affairs of the see of Llandaff during the interval between the death of one bishop and the appointment of another by the King. Their rule, although rough, was probably the best at that time for the lawless districts, but afterwards these Lords of the Marches became exceedingly difficult to the English Kings to manage, as they sided with Welsh or English as they served their own purposes. Edward I., in pursuance of a larger scheme, strove to get possession of the Marches, but the Castle of Ludlow, although besieged by Stephen, did not pass into the hands of the Crown till Edward VI.'s time, when it passed from the Mortimers to the heads of the York family. Till the time of their suppression the meetings of the Council of Wales were always held in the castle as the seat of the Lord President. An attempt was made to seize the castle during the Commonwealth, but it was not finally dismantled till the close of the last century. It is now in the possession of the Powis family, who offer every facility for its inspection, with as few restrictions as possible. Perhaps those who most appreciate this and the other noble castles of the Marches are, said Mr. Clark, the members of the great English-speaking nation across the Atlantic. They are, as a rule, well versed in the details of English history, which they claim as their own also. They read of the spots where those events transpired, and cross the ocean to see them for themselves, and not only do they visit Ludlow on account of the part her castle played in the government of the Marches, but also because they have read that in the room over the gate-house, through which we entered this place, Samuel Butler wrote the first part of "Hudibras;" that the greater Richard Baxter visited the castle, and had recorded his testimony as to the manners of its occupants, and that a greater even than Baxter, John Milton, stayed as an honoured guest, and here his masque of "Comus" first saw the light; that at an age when the English language seemed to have reached its perfection, Milton, rich in the glories of that tongue which had been enlarged by the writings of Shakespeare, Spenser, and Jonson, although himself only six-and-twenty, produced here his poem unequalled in the language—exemplifying

How charming is divine philosophy!
Not harsh and rugged, as dull fools suppose;
But musical as is Apollo's lute,
And a perpetual feast of nectar's sweets,
Where no crude surfeit reigns.

The BISHOP of HEREFORD proposed a cordial vote of thanks to Mr. Clark for his eloquent address on Ludlow Castle, a motion which was warmly accorded.

The members then proceeded to visit the

parish church of St. Lawrence, a noble cruciform edifice, cathedral-like in its proportions. It consists of a nave of six bays, with north and south aisles separated from the nave by a series of lofty clustered columns and arcades; a central lantern and pinnacled tower above; transepts, chancel, south chancel aisle, and a chapel of St. John the Evangelist on the north side of chancel. The internal dimensions are 205ft. in length, by 80ft. across nave and aisles, and 135ft. at transepts; the central tower, which is of good proportions, is 166ft. high to pinnacles. Sir Gilbert Scott drew attention to the slight traces of Norman work in the jambs and bases of the west door, and of Transitional or Early English substructure to within one bay of the east end of chancel. The south aisle windows are Early English, but those of the north aisle are exactly similar in pattern—two cinquefoil lancets under a cinquefoil head—to those in the middle tower of Hereford Cathedral, and many Herefordshire churches, although unfortunately no date can at present be ascertained in any instance. In early Perpendicular days, the piers were rebuilt, and the lofty central tower erected, support being obtained by the device of flinging half arches as flying buttresses to the tower-piers across each aisle-end from the transepts, which themselves have flamboyant windows. There were evidences that the reconstruction of the nave preceded that of the tower. The members then proceeded to examine the church. The rood loft still exists (as well as the stairs), and has panelled imitation of groining on its soffits. The stalls are fine specimens of fifteenth century wood-carving, and are ornamented beneath with grotesque carving. The church was redecorated by Sir G. G. Scott in 1860, when the lantern—previously concealed by a ceiling—was opened out, and the piers straightened. We noted, however, some cracks in the upper story of the eastern face, suggesting that further tying may be desirable for safety sake. In the chapel of St. John the Evangelist are three fine north windows, filled with stained glass, which have been carefully repaired and refitted by Mr. Powell (of the firm of Hardman and Co., Birmingham). Two of the windows, which appear to be fifteenth century in date, represent in several compartments the twelve Apostles, each with appropriate symbols, and composing part of the Apostles' creed, the rays of inspiration being shed from the Dove on the head of each; the tones are quiet and severe, and more pleasing in effect than the somewhat earlier third window, which is to the west of these. Mr. Bloxam called attention to the exquisite arrangement of the drapery and sculpturing of the effigies on the tomb of Dr. John Brydgetman, who died 1637, and his wife. They were the work of Fonelli, an Italian sculptor, also employed at Gloucester Cathedral. To many of the members the need for reverential cleansing was as patent as the beauty of the carving of these recumbent figures, and suggestions were expressed to this effect to the rector. The church is rich in monuments of the Lords of the Marches, and the stained glass east window representing the martyrdom of St. Lawrence, and the series of figures in the 15th century reredos beneath are worthy of more detailed study than could be given in a flying visit. Some discussion took place with reference to a singular cavity in the east wall, which was lighted by a lancet trefoiled opening, with grated bars, of 14th century design. On the exterior of the church, and below the great east window, Mr. Bloxam expressed the opinion that it was a treasury or store for plate. Luncheon was provided in the Feathers Hotel, a half-timbered edifice in itself worthy of study. The very handsome street frontage has been recently additionally beautified, and restored in very creditable manner, and in keeping with the older work. A visit was afterwards paid by invitation of the mayor to the town museum, a well-arranged and cared-for but rather small establishment, containing a series of charters granted the borough by Edward IV. (1461), Henry VIII. (1509), Edward VI. (1552), Mary (1553), Elizabeth (1596), James I. (1604), Charles I. (1628), Charles II. (1665), and James II. (1685), some of the

earlier ones being admirably illuminated—flint weapons, natural history, and geological collections, the last being very complete. The members then returned by train to Leominster, proceeding at once to the Priory Church (of which the Rev. Mackenzie E. C. Walcott gave an account, illustrated by a ground plan in the BUILDING NEWS for September 8th, 1876 (p. 226, Vol. XXXI.). It consists of three naves of equal length and nearly equal breadth, a north aisle and tower of the Decorative style on the west end of north nave. The last nave has been restored by Sir G. G. Scott, and is the only one at present used for service. The central one is under repair; in course of reconstruction is the very singular west window, which has outside florid Perpendicular tracery, two engaged mullions running the whole height of the window on a level with the wall. The south nave is in a deplorable state of ruin, the glass has fallen from many of the windows, which are traceried with a geometrical fourteenth-century pattern, and closely studded with the ornament, the applied decoration being overdone in effect. Some of this tracery has fallen out of its place, and was supplied at the beginning of the century with intersecting wooden tracery of makeshift character. Appeals were made to the members to assist in the restoration of this aisle, which, it is hoped, will eventually be refitted for worship.

Sir GILBERT SCOTT delivered a lecture on and in the church, stating that it was the priory church of a nunnery founded in the 11th century, and annexed by Henry I. to Reading Abbey. It consisted of nave, north and south aisles, and choir—the capitals of the pillars, arcade, triforium, and clerestory being, as the visitors could see, of the severest description; thus showing, as this was known to have been built in the latter part of the 11th century, that paucity of means was sometimes a reason for plain architecture. Some dispute probably arose in the 13th century with the townspeople, which resulted in their pulling down the south aisle, and building a second nave of equal size to the Norman one; this proved insufficient in size, and a third was accordingly added a hundred years later, still further to the east. The original choir has been destroyed, but traces exist showing that it ended in apsidal chapels, and a processional path. The visitors then visited the site of the choir, the foundations of which were laid bare some years since, but have now nearly disappeared from view. Sir Gilbert Scott stated that it was proposed to rebuild a chancel, as well as restore the naves, if funds allow. Special attention was directed to the west door of the Norman nave, which is deeply recessed, and consists of a series of six mouldings, the outer one adorned with zig-zag, and the centre one with deeply waved axe-head ornaments; the capitals and abaci of the six supporting columns are grotesquely carved, but in a vigorous style, each being differently treated.

The members also visited the Town Hall, where light refreshments, offered by the Mayor, were partaken of, and the maces inspected. In the Corn Exchange below stood the ancient ducking-stool for scolds, said to have been used during the last generation—an unwieldy appliance for silencing a woman's tongue, consisting of a wooden arm-chair balanced on a beam some 2ft. in length, the whole being supported on a stout frame and massive wheels, or rather circular discs of wood. The ancient Town Hall was also visited; it is a fine half-timbered building of great solidity of construction, and formerly stood in the centre of the town; some years since it was moved to an open space near the church, and is now occupied under the title of the Grange House, as a residence, by Mr. Moore.

Antiquarian Section.

The opening meeting of this section was held in the Woolhope Club-room in the evening, when Sir Wm. Guise, Bart., as its president, read a paper upon

THE ARCHEOLOGICAL RESULTS OF THE PAST YEAR.

No such year of success in all branches of archaeological research as this had occurred previously within the lecturer's remembrance. Referring first to the excavations made at Olympia, where the site of the great Temple

of Zeus, described by Pausanias, has been discovered under the superintendence of Prof. Von Curtius, of Berlin, both the discoveries of Dr. Schliemann were alluded to, regret being expressed that the learned doctor has done but scant justice to his precursors in the field of Troy—notably to that of Charles Maclaren—in his published work and in his addresses before the learned societies of London. Whether Dr. Schliemann's finds are really those of the treasures and tomb of Agamemnon and his companions must still remain a doubtful question. The discovery of an ancient Etruscan sepulchre, rich in jewels and gold, in a field at Palestrina during last year, has more than passing interest in the controversy as to the origin of the Etruscan language. Amongst the contents of the tomb is a silver tazza, exhibiting in its ornamentation the same mixture of Egyptian and Assyrian styles as that upon a tazza from Cyprus and another from Salerno. It is interesting to observe that all the archaic remains found in Cyprus, Salyns, Ilium Novum or Hissarlack, Olympia, Mycenæ, and perhaps the tombstones of the second period at Bologna, have a general resemblance in style and ornamentation. Antiquarian and linguistic science has sustained an irreparable loss by the removal from amongst us of Mr. George Smith, of the British Museum. He seems to have discovered the site of Carchemish, a chief place of the once powerful Hittite people, who have been claimed by Mr. Hyde Clarke as the ancestors of the Etruscans.

The PRESIDENT suggested that each member of the Institute might do something to aid in the onward march of archaic science by accurate observation in his own neighbourhood, and most of all by aiding in the conservation of ancient monuments. For this latter object he hoped that Sir John Lubbock's bill would soon become law, and that the Institute would share in the honour by using all its influence to overcome the private and territorial scruples to the bill.

The Rev. Prebendary SCORTH, M.A., read a paper on

THE ROMAN MILLIARIES OF BRITAIN.

The number of the milestones of Roman military roads yet discovered in this island has been 45, the periods embracing extending over 200 years—from the time of Hadrian, A.D. 120, to Constantine, junior, A.D. 336—thus affording proof of the time at which the roads were kept in good repair. Most of the stones have probably been re-used for building purposes or destroyed in the course of centuries. Special reference was made in the paper to the Roman roads through Wales and the West of England.

The PRESIDENT remarked that a great work remained to be done by the local societies in tracing out the course of the ancient Roman roads.

THURSDAY.

Yesterday (Thursday) morning was assigned for the annual meeting of the Institute, after which a perambulation of the city was made, the principal antiquities being examined with as much care and attention as time permitted. In the afternoon an excursion was made by carriages to Sutton Walls and Marden Church, and other objects of interest north of the city, the day's proceedings closing with a conversazione in the temporary museum at the Free Library. The principal objects in this collection, which had been arranged by the Rev. F. T. Havergal, M.A., and Mr. J. T. Owen Fowler, assisted by Mr. R. Ready, from the British Museum, are celts and Roman pottery found in the country, bronze gilt mediæval reliquaries, and monstres, fine silk embroidery of late seventeenth century workmanship, from Foye, near Ross, Worcester and other china, antique cider jugs, and illuminated MSS., books and engravings, and charters lent by the dean and chapter and the corporation—the gem of the collection being a fragment of a grant from Cuthwulf, dated 840. The civic maces, sword, and plate, excellent specimens of solid silversmith's work of Charles II.'s time, were also exhibited.

The programme for to-day (Friday) includes an excursion through Haywood Forest to Kilpeck and Ewyas Harold Castles, Abbey Dore

and Belmont Priory; that for Saturday a visit to Ross; on Monday Kenchester and Brewardine are to be visited; and on Tuesday the Congress is to be closed by a visit by boats from Worcester to Tewkesbury Abbey. We shall continue our special report in our next issue.

LEGAL INTELLIGENCE.

INTIMIDATION BY UNIONISTS.—Five men named Keal, Morgan, Flintoff, Marsland, and Garth, cabinetmakers, were indicted at Preston Quarter Sessions on Thursday in last week, charged with persistently following Frederick Webster for the purpose of compelling him not to work for Bell and Coupland. Defendants are all members of a trades union, and at the end of April left the employ of Bell and Coupland because of a trade dispute, and their places were filled by Webster and other non-society men. From the 1st to the 8th May Webster was persistently followed by the defendants, who collected large crowds of people in the streets, and he and another were greatly annoyed because they refused to leave work at Messrs. B. and C.'s establishment. It was proved that Keal said to Webster that if he did not leave work his name should be published in the paper, and he would never be able to get work elsewhere; that on one occasion the protection of the police was necessary, that Flintoff told Snowdon, another non-society man, that they should be followed about morning, noon, and night, and that the foreman was informed the shop should be picketed and made too hot to hold him. The case occupied the court 5½ hours, and at its close defendants were convicted and fined £10 each and the costs.

WATER SUPPLY AND SANITARY MATTERS.

SOUTHPORT SEWAGE WORKS.—EXCEEDING THE ENGINEER'S ESTIMATES.—Colonel Cox, inspector to the Local Government Board, held an inquiry on Wednesday, the 1st inst., at Southport, on an application from the Corporation for sanction to borrow an additional £30,000 to carry out the sewage works, from plans by Mr. Mansergh, C.E. £50,000 had, it was stated, already been borrowed under the Local Improvement Act, and this was the original estimate for the cost of the sewage works, but when the borough was extended the works were enlarged, and the estimate then made by Mr. Mansergh was £70,000, the contract being eventually let for £72,663. The contractors, however, got into liquidation with the Corporation, and the works were relet for £88,000. This application would exhaust the present borrowing powers of the Corporation, but they would borrow under the Public Health Act for the rest. It was intended to carry out still further sewer construction, but to spread it over 10 or 15 years. Mr. Mansergh, C.E., was examined by the inspector and said that up to the end of July £52,818 7s. had been spent on the measured-up work, and £4,937 on extras. The work to be done, according to the estimate, amounted to £35,570, and extras on that being £1,334, made a total of £94,840. The difference in the contract arose partly from an additional quantity of timber being absolutely required to be put into the work, partly as the inevitable result of a change of contractors, together with the gradually increasing price of work. The estimate was originally advanced from £50,000 to £70,000, owing to the enlargement of the main sewer on plan from 5ft. 3in. to 6ft. 4in. It has been all lined with blue bricks, and altogether said Mr. Mansergh, the job has been a very costly one. No opposition was manifested by ratepayers, and at the close of the inquiry the Local Government Board inspector visited the works in progress.

WEST LOOE, CORNWALL, is about to be supplied with water by gravitation from a stream flowing into the Looe river. Mr. E. Appleton, of Torquay, is the engine and Mr. Stoney, of Looe, the contractor.

The Kilmarnock Town Council have agreed to the erection of a model lodging-house under the supervision of the Board at an estimated cost of £2,000.

The memorial stone of a new Roman Catholic church has been laid at Washington, Durham. Messrs. Dunn and Hansom, architects, of Newcastle, have prepared the plans of the building, which is in the Decorated style, is to be built entirely of stone, and will accommodate about 500 people.

The foundation stone of the new workhouse at Middlesborough, about to be erected at a cost of £40,000, was laid on Thursday, the 2nd inst. The style of the building is Gothic; it is planned on the pavilion system, with a corridor running across the main front. Accommodation is provided for 226 inmates, besides 138 patients in the hospital, to be erected in connection with the union in Ayresome-lane and the schools, which will accommodate 220 children.

Building Intelligence.

ALTRINCHAM.—The directors of Parr's Banking Company have erected new offices at Altrincham. The banking-room, in addition to an open fire-place, is also warmed with Constantine's convoluted hot-air apparatus. The building, the ground floor of which is wholly of stone, is designed in the Italian style, and comprises on the ground story entrance to the bank as well as to offices above, with three sets of intermediate windows to light the bank, divided into double lights by red Aberdeen granite columns with carved floriated capitals, moulded label moulds, and bold stone cornice. The whole of the work has been carried out according to designs prepared by Mr. Pons, architect, Altrincham and Manchester; and the decoration of the interior has been entrusted to the care of Mr. J. L. Owen, of Bowden. Mr. Martin Stone, of Altrincham, was the general contractor.

BLACKMORE.—This interesting parish church has at length, after centuries of ruinous neglect, been restored and beautified, and was reopened by the Bishop of St. Alban's on Saturday week. The now decayed village of Blackmore, near Ongar, was once a flourishing town; the church was an adjunct to the Priory of St. Lawrence, of which a few traces remain; and Jericho House, close by, was a favourite hunting-seat of Bluff King Hal. Under the direction of Mr. Barton, of Ongar, who has acted as architect and builder, the church has been carefully restored. The ancient wooden steeple, which stands on a massive Norman base of piers and columns, has been reshingled, the west gallery and vestry beneath have been cleared away; for unsightly high pews open benches of pitch pine substituted; all the church furniture, and pulpit, and reading-desk being the same wood, with the exception of the communion chairs, rails, and standards, which are of oak. The stonework has been renewed where necessary, and the plaster has been removed from the walls, while the church has been paved throughout with Staffordshire tiles in three colours. The wainscotted roof, in which occur amongst other arms those of Richard II. and those noble families connected with the Priory and neighbourhood, has been carefully repaired, as has also the window in the north wall, representing the martyrdom of St. Lawrence, to whom the church is dedicated. This priceless remnant of the ancient stained glass has been injured within recent years by gunshot through the saint's head. The numerous monuments of the Smyth family, notably a large 16th century one in alabaster in the chancel, with recumbent figures of man and wife upon it, have been restored. The cost has been about £1,000.

CRIEFF.—The new church for the Episcopal congregation at Crieff was opened last week. The church consists of porch, nave, south aisle, chancel, organ chamber, and vestry, with heating vault under. It is built externally in rustic coursed work, with local sandstone of a warm brown tint, and white stone dressings from Bannockburn. The style is Early Decorated, with open timber roofs. The nave is 74ft. long, 35ft. wide, and 45ft. high to apex of roof, and is seated for 470. The south aisle is 50ft. long, 12ft. 6in. wide, and 20ft. high, and contains seats for 106. The chancel is 28ft. long, 28ft. wide, and 37ft. high, and is seated for a choir of 28. The organ chamber is 27ft. long, 11ft. 6in. wide, and 30ft. high, and will be furnished with a powerful organ. The tower, which is 18ft. square, has a moulded entrance and massive buttresses, and is at present 40ft. high, but other 20ft. has yet to be added to its height, as well as a fine spire rising to the elevation of 140ft., built with Bannockburn stone, interspaced with bands of local stone. The total cost of the church (inclusive of the old material of the former building) will be about £6,200, or with spire, &c., all complete, about £7,000.

EXMOUTH.—The schools erected by the Exmouth School Board, on a site in the Exeter-road, have just been completed. The accommodation is for boys and girls only, each department having a school-room, with one

class-room. The residence for master is rather larger than usual, and on the ground floor is a spacious board-room, with book-store adjoining, entered from a separate porch. The walls are of brick, built hollow, faced with red bricks, relieved by a few black bands. The roofs are tiled, and above the main gable rises a fêche for bell. The works have been carried out by Messrs. H. and F. Burridge, of Exmouth, from plans prepared by Mr. H. Lovegrove, of 30, Budge-row, Cannon-street, London. Mr. F. E. Carter has acted as clerk of works.

JARROW.—The foundation stone of a new Primitive Methodist church was laid last week at Jarrow. The buildings will be of stone, in the Italian style. The church will accommodate about 800 persons. The schoolroom is behind the back gable of the church, and is 52ft. by 32ft. 6in. A large infants' class-room, three vestries, and a care-taker's house are to be provided. The total cost of the church and schools will not exceed £4,000. Mr. Thomas Southron, of South Shields, is the architect for the buildings, and the contractors are Messrs. Shields and Cruickshanks, of Gateshead.

LEEDS.—Three new Board schools were opened at Leeds on Saturday. The Park-lane Schools are designed in the Italian style of architecture, and will accommodate about 700 children. The building is of brick, with stone dressings. The Prince's-field School is in the Gothic style, and will accommodate about 450 children. The building is of brick, with stone dressings, the windows having stone mullions and jambs sprayed with trefoiled head. The Bramley School, which is also in the Gothic style, accommodates 400 children. All three schools are from the designs of Mr. K. L. Adams, the architect to the Leeds School Board. Shillito and Shorland's Manchester School Grate has been adopted for heating each building.

LOWER SAPEY.—The new church at Lower Sapey, Herefordshire, was consecrated last week, and consists of a nave 36ft. 9in. by 19ft. 6in.; a chancel, 24ft. by 14ft. 6in.; an organ chamber and vestry on the north side of the chancel, and a porch on the south side of the nave. The style is latter thirteenth century. The detail of the work in the nave is simple and effective, all the windows being treated with chamfered jambs and arches. In the chancel, especially in the interior, the work is much more elaborate, the interior arches being richly moulded, and a number of columns of coloured stone, with carved caps and moulded bases, introduced. The floors of the chancel, passages, and nave are laid with Godwin's encaustic tiles; the remainder of the flooring is of board. Native stone has been used as far as possible, but the windows and arches are executed in Bath stone. The church is covered with Brosely tiles, and the west end carries a double bell turret. The architect is Mr. Kempson, Hereford; Mr. Collins, Tewkesbury, was the builder; and Mr. Williams, Hereford, foreman of the works; the carving was executed by Mr. Clarke, Hereford. The total cost of the new church amounts to about £2,000.

METROPOLITAN BOARD OF WORKS.—Deputations from the vestries of St. George, Hanover-square and Chelsea waited on this Board on Friday to request that a fire-brigade station should be established in the vicinity of Sloane-square, which is the centre of a densely populated district, and about a mile from the two nearest stations. The memorial was referred to the fire-brigade committee. Subject to the passing of the Loans Bill of the Board, a cheque for £4,250 was ordered to be paid over to the Lewisham District Board for the completion of the purchase of land to be set apart for a recreation ground at Sydenham and Forest Hill. Upon the same condition, the following applications for permission to borrow sums for improvements were granted local authorities of the metropolis, the loans being repayable by equal annual instalments, with the addition of £3 15s. per cent. interest, except in the case of Lewisham, in which 5 per cent. is to be charged:—Chelsea vestry, for excavation of sewage works, £8,000; St. Pancras vestry, asphalt and wood paving works, £10,200; Greenwich District Board, purchase of freehold wharf at Deptford, £4,150; Lewisham District Board, paving works, £3,375;

Marylebone vestry, sewerage works, £11,000; Fulham, ditto, £4,125; Metropolitan Asylums Board (further loan), £46,575; Guardians of Strand Union, for paying off old loans, £32,000; and Lee Burial Board, ditto, £2,200. The Works Committee reported that they have decided to serve notice under the Metropolitan Toll Bridges Act on the Lambeth Bridge Company in the month of September next, and to consider, immediately after the recess, as to serving the notices upon the Waterloo Bridge Company, and in respect of the foot-bridges at Charing Cross and Cannon-street. The Sanitary Committee reported with regret that an infringement of the provisions of the Petroleum Act was being committed at a wharf and premises on the river Lea, below the bridge, at Three Mills-lane, Bronley-by-Bow, where a large quantity of petroleum is so stored as to be dangerous. It was decided to address the Home Secretary, calling attention to the fact, and pointing out the desirability of an amendment of the law with regard to petroleum.

PUBLIC HEALTH.

The Leading Journal of Sanitary Science and Progress. Price 2d. (Annual Subscription, Eleven Shillings, post-free). The number published August 10 contains articles on Model Bye-laws for Sanitary Authorities, Bristol and its Sewers, The British Medical Association at Manchester, Newcastle-on-Tyne and the Artisans' Dwellings Act, The River's Pollution and Prevention Act, Skin Cleanliness, The Heavy Infantile Mortality at Maclesfield, Mr. Gladstone on the Sanitary Evils of Large Towns, Poisonous Gases in Dwelling Houses, The Quarterly Report of the Registrar-General, Parliamentary Notes, Legal Intelligence, Public Health Reports, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c. Price 2d.—31, Tavistock-street, Covent-garden, and all News-vendors.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

WISHPUL TO LEARN. (The die is used with a stamping press. It is altogether a trade process, and not likely to be executed by an amateur. The press would cost you at least ten pounds. The colour is carefully brushed into the sunk letters, and then wiped off the flat surface before each stroke.)—W. G. THOMAS sends to correct the motto "Onward" we assigned to the bronze medal pattern of the Westminster School—it should have been "Ou."

ARCHITECTURAL SCIENCE CLASS.—Received: A. L. B. (The initials, referring to question 56, were a misprint; they should have been yours instead of T. N. In reference to your second query, your reply to No. 57 was the published one, and as a rule we notice only the other replies in the summary; this is the reason yours was not mentioned.) We shall publish our award next week, and those correspondents who have not yet forwarded us their names, addresses, and ages, with *noms de plume*, are requested to do so.—J. S. A. M. (Thanks for your appreciative letter in relation to the Architectural Science Class.)

BUILDING NEWS DESIGNING CLUB.—Received: Thos. C. Fowler, Jacobus, Torpedo, Isola. (Continue by all means. Although your designs have not been yet published, they show a marked improvement.)—JACOBUS IN CIRCLE. (Yes.)—R. KENDRICK.

Correspondence.

THE QUANTITY QUESTION.

To the Editor of the BUILDING NEWS.

SIR,—I should be sorry to suggest that the statement of your correspondent, "Clamans in Deserto," is incorrect, but it is absurd to suppose that a surveyor would increase the quantity of painting by forty per cent. My own experience, with my own quantities and those prepared by other surveyors, is, that they are rarely excessive; generally very close. Your correspondent would have the world believe that those gentlemen who follow the surveying branch of the profession are little better than thieves, who prepare "fat" quantities that they may receive a commission on a larger sum and be free from blame through errors in certain items. Quantity taking—like any other special branch of the profession—requires practice and experience, and if an architect thoroughly works out his design he will have very little time to take out quantities, but will have no difficulty in finding a surveyor who will render him great assistance in keeping his design within reasonable limits of cost.—I am, &c., A CLOSE MEASURER.

ARCHITECTS AND QUANTITIES.

SIR,—My experience as an architect widely differs from "Clamans in Deserto," and my interpretation of the general drift of the controversy on "quantities" in these pages is certainly opposed to his. I will not occupy your valuable space with more than one reference to the letter of "Clamans in Deserto." The writer remarks, "one point in favour of the surveying architect is that he can protect his client from enormous overcharges, which are caused by excessive quantities, whereas the non-surveying architect cannot and does not." Now I would merely ask if the "enormous overcharges" are not as frequently found to exist when the architect prepares his own quantities as otherwise. Does he not often take them full to protect himself? My experience in "quantity" taking has at least assured me that the excess is quite as often on one side as the other; I am inclined to think rather more so. The case mentioned under three acts does not confirm anything: it shows only that in that particular instance the independent surveyor either blundered or wanted to protect himself, neither of which things he would have been likely to do if the independent surveyor knew he was protected and recognised.—I am, &c., CONTRIBUTOR.

EGYPTIAN ARCHITECTURE.

SIR.—In reply to "One in Egyptian Darkness," I may say that he need be no longer in doubt on the question of awnings. Speaking of the Egyptian palace in "The Habitations of Man of all Ages," "Viollet-le Duc" says: "In front of the great hall stood an enclosure upon which was stretched an azure veil. . . . All the central part open to the sky could be covered by awnings hung between poles fixed in the terrace," &c. I have not the time to hunt up other allusions to the subject in this author's voluminous works, which your correspondent could easily find. All I need repeat is that the awning is frequently mentioned in connection with both Egyptian and Assyrian architecture, and screens of this kind are spoken of by Fergusson and other writers. I may simply ask how the glare of an Eastern sun could have been kept off but by such means? If "One in Darkness" is sceptical on any point, he certainly need not be so on this one.—I am, &c., THE CRITIC.

LOUGHBOROUGH ENDOWED SCHOOL.

SIR.—The governors have received 23 designs in response to their advertisement. It is said that, having excluded the greater number, they intend to take professional advice as to the comparative merits of the remainder. Whatever reasons may have induced them thus to limit the range of their adviser's investigations, the result of such a course is certain, as far as competitors and the public are concerned—namely, to destroy all confidence in the justice of the award. It is to be hoped they will reconsider their decision, and allow their adviser to tell them "the whole truth," even if the truth should not be pleasant.—I am, &c., VERAX.

Intercommunication.

QUESTIONS.

[5082.]—Party Wall.—Could some one kindly answer the following question?—A and B are adjoining owners of some building land. A builds and makes his ground level lower than B, who, by agreement, is to build a party wall 6ft. high; from which level is the 6ft. to be measured—A's or B's?—ONE IN DOUBT.

[5083.]—Board Schools.—What is a fair average cost per head, including teacher's residence, boundary walls, school-fittings, and making of play-yards? Also, is it more economical to build with a first-floor, or all on ground-floor, space being no object?—E. C.

[5084.]—Quantities for Joiner and Carpenter.—In taking the quantities for the above how are floors, roofs, and ceilings measured and described? In the "Manchester Method" (as given in the BUILDING NEWS of 1874, clause 2) it says, "Labour, framing, and nails to be measured super in square yards for floors, roofs, and ceiling-joists." This is very plain; but in clause 9 we find deals, planks, and battens used for joists, &c., to be taken lineal. Again, clause 11 says, "All timbers to be measured nett lengths as fixed," &c. How are these to be read? Should the measurement be taken in super yards—i.e., contents of each floor, roof, or ceiling super yards, and the builders to find what lengths of timber will be required to complete the same; or should the lengths of joists, spars, or ceiling joists be given in feet lineal? An answer will oblige greatly.—ONE PUZZLED.

[5085.]—Plumbers' Quantities.—In giving quantities of piping (for either gas or water) for this trade is it understood to take the quantity required to reach the mains in the street or only the quantity required in the building, leaving the company that supplies either the gas or the water to come up to the houses or buildings?—ONE IN DOUBT.

[5086.]—Glass.—How is plate-glass distinguished from sheet-glass, and what are the principal features to observe in guiding one as to their different merits for different uses?—ONE IN DOUBT.

REPLIES.

[5075.]—Tar Pavement.—I lay down tar pavement as follows:—The bottom bed, 2in. in thickness, is composed of broken stone, or gravel, not larger than will pass through a 2in. sieve; the top bed, clean gravel, or, for good work, granite chips, run through a $\frac{3}{8}$ sieve. The gravel is well dried by being heaped over a fire, the tar is well boiled and used whilst in that state, and care is taken that too much tar is not used, or the asphalt will not set; about half a pint of ground unslaked lime is mixed with every barrowful of the top stuff—this makes it set quickly. The beds are put on separately, and well rolled, covered with fine dry sand, and again rolled. The pavements are tarred and sanded over every summer at very little cost, and often last for seven or eight years.—J. W. W.

[5075.]—Tar Pavement.—If "Surveyor" will refer to your issue of June 8th, he will find in the report of the meeting of the Association of Municipal and Sanitary Engineers, held at Ipswich, a general answer to his questions. In practice, it will be found extremely simple, and for suburban paths especially. Tar paths, if properly prepared and laid, will be found to answer well. As a rule, surveyors will have some particular way of preparing their materials, and while some prefer pit shingles others will use burnt ballast or furnace slag. For some time past I have laid tar paths in various parts of my borough, and they have given great satisfaction to the inhabitants generally. I generally use furnace slag, and sometimes a little gravel mixed with it. I always burn it and pass it through a screen $\frac{1}{2}$ in. mesh, and mix it as hot as possible with boiling tar. To an ordinary barrow load of coarse stuff I use about three gallons tar, and to a barrow load of fine stuff 5 gallons. It must be thoroughly mixed and laid in a heap for at least a month before using. I often let it lie 4 or even 6 months, and find that the longer it lies the harder the path will become. In laying the path, be careful to get a good solid bottom. Lay your coarse stuff about 2 $\frac{1}{2}$ in. thick, with a fall of 1in. in a foot to the curb. Pass a heavy roller over it twice, then lay on your fine stuff about 1 $\frac{1}{2}$ in. thick. Spread it evenly over the coarse stuff, and roll it well. I use one of Barford's water ballast rollers, weighing when full 12wt. I always roll the paths well with an empty roller, then let them lie a day or two and then roll them with a filled roller. Coal tar will be found to answer very well, but refined tar is better. If Derbyshire spar is rolled well into the paths, it will give them a pleasing appearance. My paths cost about 10d. per square yard.—PECKSNIFF.

[5078.]—Arch or Lintel.—"Pupil" does not say what position his arch or lintel is to occupy. Assuming there is a good abutment, I should prefer the arch; if there is not, the lintel is best. The arch, if properly built, will bear the greatest weight; but supposing the arch abuts against a narrow pier I should certainly prefer a good stone or timber lintel. For narrow openings lintels are very often to be preferred, but in proportion to the extent of opening the arch becomes desirable.—G. H.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 17, 1877.

TOURISTS AND ARCHÆOLOGISTS.

IT may be fairly asked what the great annual exodus contributes to our art—whether the holiday Rambler brings back with him any useful impressions? In the course of a few days, the artistic, archaeological, and architectural professions will be far from the “populous city pent,” some climbing Alpine precipices, some strolling leisurely by the sea-beach, others engaged in antiquarian explorations. Each votary is, no doubt, bent on change and pleasure, and, on the principle that there is a time for everything, will be disposed to take his fill of those things he has little chance of enjoying during the rest of the year. As in every other thing, there is a conventional and fashionable way of taking these excursions. For the Londoner, of course, the sea-side has, and always will have its charms, despite its monotony. Brighton and Scarborough, Great Yarmouth and Ramsgate, will receive their usual votaries of fashion, or pleasure, or health, while many a small and less-known watering-place on the south and west coasts will be deluged with admirers of the marine landscape. Tours are, nowadays, cut out for the annual excursionist; he selects a programme, takes a certain district or route, and pays a fare—a mode of pleasuring that pleases some people and distracts others. This cut-and-dried sort of tour has certainly its drawbacks. It may suit very well the man of social proclivities, who likes gossip and chit-chat, and who does not mind a scamper, but it certainly does not recommend itself to the student, the artist, or the archaeologist. To these an object or a pursuit becomes one of the main sources of pleasure, and the less hackneyed it is the better. Last week our columns contained, and again this week they contain, a full account from our special reporter of the doings of the Royal Archaeological Institute, at Hereford, and probably a more interesting field for research could not have been selected. Rich in soil, and luxuriant in vegetation, the architecture of this district is set off to advantage, and is enhanced by the warm reddish sandstone of the geological formation; here and there the half-timbered structures indicate the abundance of oak the old builders found ready to their hands, while the natural scenery through which the Wye meanders possesses all the captivating features of landscape. The scenery along the banks of the Wye, edged by poplar and willow, is, perhaps, equal to any of our English rivers—at least, we know of only one or two to compare with it in this respect. Rising at the southern side of the Plinlimmon Hills, in North Wales, it marks the division of Radnor and Brecknock, Monmouthshire and Gloucestershire, and falls into the Severn, below Chepstow. Architecture has helped to increase the beauty of the varied course of this river. Ruins of castles, embosomed hamlets, the spires of churches, and overhanging rocks invest it with singular interest, and the tourist and artist could scarcely choose a more pleasant tour than in traversing the districts in its course. Few cathedrals present such a wide range of style as Gloucester, verging from early Norman to advanced Perpendicular. We seem to have here an anti-climax of style—a hard blending of rude Norman and late 16th-century Gothic. Its massive nave—pillars of circular form, and lofty proportions, with the deeply moulded and enriched arches that rest upon them, are remarkably archaic and simple, while the enriched Perpendicu-

lar choir, encasing the Norman work, and the Decorated aisle windows, thickly set with the ball flower, present us with a vigorous contrast and wealth of mediæval design that is well worth a tourist's trouble. The grand Perpendicular window at the eastern end, with the richly-ribbed vault of choir and presbytery, are perhaps without a parallel. We know of only one—the west window of Winchester—that can compare with the former feature; but the *coup de grâce* to our minds is the splendid Perpendicular tower over the crossing, with its open lacy parapet of pierced panelling. The *tout ensemble* is admirable, while the richly-divided side of tower is an unique instance of Late Gothic. What struck us particularly in connection with the tower were the great arches on the east and west sides, seen above the flat roof of nave, and the high-flying buttresses on the west side. The whole tower seems to spring from and to be built upon this arch. But, with our admiration, we are obliged to confess that the nave externally is the poorest we have seen. What can be more distasteful than the west window, with its outer mullion buttresses, its ugly curved arch, its flat pierced parapet and pinnacles? Hereford, about which Sir Gilbert Scott read an elaborate paper, or rather delivered an elaborate speech, is chiefly interesting for its old Norman nave, a conjectural restoration of which was shown by the speaker; its fine west front, its transepts, its 13th-century detail, and its grand Lady Chapel. We refer our readers to the paper itself, as reported in our pages. Kenchester, one of the places marked out in the programme of the Archaeological Institute (but not visited from the lack of time), is an ancient Roman town of great interest, of which Leland writes: “This town is far more ancient than Hereford, and was celebrated in the Roman time, as apperith by many things, and especially by antique money of the Cæsars, very often found within the town, and in ploughing about, the which the people then call dwarf's money. . . . Pieces of the walls and turret yet appear *prope fundamenta*, and more should have appeared if the people of Hereford town and thereabout had not in time past pulled down much, and picked out of the best for their buildings.” We are afraid the same spirit Leland records exists now, though there were no archaeological societies who may fairly be said to make business of pleasure. Hereford is said to have arisen from the ruins of old Ariconium, or Kenchester, which was shaken by an earthquake, and Speed records a similar phenomenon in 1571. The county of Hereford is remarkably rich in Roman roads and entrenchments, and this border county was in past time a scene of many a raid of the Welsh. Thus near Wigmore Castle a battle was fought between Owen Glendower and Edmund Mortimer; and the historic battle of “Mortimer's Cross” was fought between Wigmore Castle and Leominster. Speed enumerates twenty-eight castles in this county, many of which do not now exist. It was at Hereford Eleanor Gwyn and David Garrick first saw the light—the first in a humble cottage in Pipe-lane, and the latter in Wide Marsh-street.

The western districts of England, from Chester on the north to Gloucester on the south, are remarkable for archaeological subjects no less than for charming scenery. There are Ross, Abergavenny, Leominster, Shrewsbury, Oswestry, Nantwich, Market Drayton, Tewkesbury, Alcester, and a dozen other places, centres of interest to the architect and archaeologist, many of them barely explored. Madley, on the banks of the Wye, has a very interesting Norman and Transitional church, with a tower of late Norman date. Inside, a vaulted roof claims notice. The apse is also curious; it is

angular, or semi-hexagonal. Monmouthshire is replete with delightful spots for the artist and lover of mountainous scenery. Few more interesting old cities to the architectural tourist are there than Chester, on the border of North Wales, once a great Roman station, or the castra of North-west Britain. Every one probably knows, or has heard of the “Rows,” but there are many other features to instruct and interest, as Stanley Palace, and other structures of the 16th and 17th centuries abound; Bishop Lloyd's house, with its galleried front and gable carving, is a unique bit for the sketch-book, and the cathedral of red sandstone is a mine for the architectural sketcher.

Another route, comparatively unfrequented and little explored by the tourist, in search of the archaeological, is South and East Devon. Exeter alone is worth a ramble; its streets are full of timber gabled-fronted houses; and in North-street and Fore-street there are one or two exquisite studies for the architect intent upon making our streets something better than flat and monotonous walls. The “bay” has been pleasingly worked out by the old builders of the west, and as one sees every type of it in Salisbury, Exeter, and a few other of the old cities of this part of England, it is a charming feature. Cornwall also has its attractions both for the archaeologist and geologist, though its beauties are perhaps better known than some of those localities we have pointed out. It is quite evident England and Wales, to say nothing of North Britain, is rich enough in seascape, landscape, archaeological and architectural objects to satisfy the most varied taste, without leaving its shores, and there are numerous localities untouched by the architectural tourists, as far as critical examination and sketching is concerned in rural districts that lie between the main railway routes in the west of England. Last year the Architectural Association took one of these little explored regions and brought home some capital sketches from Hampshire and Wilts. Under the directorship of the late much respected and much-lamented Mr. Sharpe the members made excellent use of their time, and it is much to be regretted his guidance this year has been lost, and now lost for ever. We are afraid a week's work is insufficient for any thorough examination of a district. Last year, with the exception of a few sketches, the time of the Association was frittered in the large area selected. There are two methods of making a tour: one is a hurried scamper through a certain locality, the chief objects of which are miles distant from one another; and another plan is to take one object or town at a time and thoroughly study its buildings. The general tourist's idea of architecture is no deeper than that of his guide-book; and the parrot-like information furnished by the old verger in one of our cathedrals is probably the only impression he brings away with him. Those who can sketch can always be making use of their eyes and pencil; but even those who cannot sketch can use their note-book in jotting down the characteristics of the neighbourhood, and in remarking upon the principal features that strike them. An architectural, or indeed any student, might very pleasantly pass his time in noting the typical features of a certain locality, such as the geological formation, the material chiefly used in building, its durability, the kind and treatment of roof-covering, mercantile and street architecture, the salient features of the churches; and the practical sanitarian might well bring away with him the results of a certain system of drainage or scheme of utilisation; the wear of the local metalling of the roads, and a variety of other data that may be found of service to him in his practice. Such information can be picked up easily enough, and without in

the slightest impairing the pleasure-seeking proclivities of the tourist. If the annual excursionist pursued this plan, and had any mind for classification, he would in a few years possess a fund of reliable experience. If there were a few Rickmans, Pugins, and Sharpes among the profession; a few Darwins, and Spencers, and Carpenters to infuse method, and to arouse the spirit of classification, our tourists would quickly enhance the value of their present rather desultory studies at this season of the year. There seems to be a plan wanted, some method of classifying the fragments and sketches with an object more definite than the satisfaction of merely increasing one's portfolio with unconnected scraps.

THE PRESERVATION OF TIMBER.

CONSIDERABLE doubt was recently expressed in a paper read before the American Society of Engineers touching the value of the creosoting process as a preservative against worm. In the United States, indeed, the importance of this question cannot be overrated, timber forming so large a part of the builder's staple. Mr. Clinton B. Sears is the author of the paper referred to. In a recent discussion on this paper Mr. Charles Douglas Fox says he has used creosoted Baltic redwood in a tidal river where the worm is prevalent, and for several years has found it a complete protective. The timber was impregnated with 10lb. of oil of creosote per cubic foot. This opinion rebuts the statements made by Mr. Sears, and we believe the efficacy of the creosote process depends on its thoroughness. Mr. Fox lays down a few conditions of success. He says the timber should be previously well dried in open stacks, that the charge be carefully weighed in and out by an inspector, and that the inspector should be present while the oil is being injected, to assure that the oil is of good quality, and that the suction-pipe passes well below the surface of the oil in the tanks.

Mr. S. B. Boulton, of a London firm, supports Mr. Fox's views, and observes that the "Robbins process" is thoroughly inefficient, as it fails in injecting a proper quantity of the creosote. "Creosote injected by vapour has the effect of introducing a small quantity of the oil into the timber, which discolours it indeed, but is not present in sufficient volume to protect from decay or attack, and 1½lb. of oil to the cubic foot of timber would be altogether inadequate for either purpose." The same writer maintains that saturation with the oil to the extent of 10lb. or 12lb. per cubic foot has been carried out largely in England for thirty years, and the treatment has been found very successful. Imperfect saturation is assigned by Mr. Boulton as the cause of failure, as he found that wherever the timber had been attacked it has been in the uncreosoted parts. There is, the writer said, "an enormous series of hydro-carbons, but some of them containing petroleum have not been found efficacious for preserving timber." Petroleum is not used in England for this purpose; in Holland they have been tried unsuccessfully, and it is likely a similar oil was used in America. Mr. Sears, in reply to these objections, says his remarks embodied American practice and results only, and that he had in view the rigid ideas of economy imposed on American engineers.

There is, no doubt, considerable uncertainty as to the efficiency of many injections. We believe much depends on the kind of oil injected, the dryness of the wood, so that its pores are not preoccupied, and the comparative porosity of the wood. Some chemists and engineers prefer thick oil, or that rich in naphthaline; others, the thinnest oil, containing no naphthaline;

but the thin oil is said to be drawn out by the heat of the sun, or be dissolved out by moisture. The action of creosote is to coagulate the albumen, and to fill the pores with a bituminous substance which preserves the fibre from moisture, prevents its absorption, and is obnoxious to animal life. In Mr. Britton's treatise on this subject it is stated, "where the complete preservation of timber is of vital importance, and expense not a consideration, the wood should be first subjected to Burnett's process, and then creosoted," by means of which the sap absorbs the creosote more readily than the heart of the timber. Thus the wood should be first injected with metallic salts, then dried, and next creosoted. It has been discovered that some of the sleepers used on Indian railways have been decayed in the centre, but this has frequently arisen from the employment of the hard woods of India. Mr. Sears finds considerable difference in the quantity of creosote thought necessary to insure immunity from the teredo. Thus, Forestier, engineer-in-chief of the Ponts et Chaussées, says nothing less than 18½lb. per cubic foot can be considered reliable. Again, he observes, taking all the experiments, two only give tests of over ten years; the average for the English being seven, and three for the French experiments. It is considered a question of time as to how long the creosote will remain undissolved or washed out by the seawater, and the timber fall a prey to the teredo; if the life of the timber can be extended 25 years, it is thought the process sufficiently effective and economical, but anything under this term would be hardly satisfactory. One observation is worth quoting: it is, that the timber is best treated after framing. This, however, is seldom the case, and it is one of the greatest drawbacks of the process, in our opinion. To cut and reduce a timber just at its junction with another (inevitable in framed work) after its injection, is to expose the timber in the most assailable parts for the attack of insects. We may add the cost of creosoting is about 15s. per load of 50 cubic feet; the creosote is generally reckoned at 2d. per gallon. The labour and profit may be put at about 5s. to 6s. per load of 50ft.

BUILDING ACCIDENTS.

THE United States have afforded within the last few months ample materials for a long chapter on accidents. The Ash-tabula Bridge accident has been followed by several untoward failures of a structural kind of more or less significance to architects and builders, tending to show the necessity of making both responsible parties instead of leaving construction to the hands of intermediaries. The New York Post-office disaster has been the subject of various findings by different juries. Here a truss on the suspension principle, with top and bottom chords, upright struts, and oblique tension bars of four panels, fell through imperfect construction, and the grand jury at last has found that the fault lay with the incompetency of the inspector or superintendent employed by the supervising architect. The truss had never been properly fixed, but rested upon an end strut 19ft. long without lateral bracing or support, and when the shores were struck, and load was laid upon it, it fell, bringing down a portion of the roof. In fact, as far as we can judge, this failure was from a very stupid want of thought or care in not securing one end of a truss and laterally bracing it. Both this and the Rockford Court-house accident are of special import to the architect.

Another account reaches us of the fall of a house in New York. In this case the particulars we have show that the fault was

the composition of a party wall which first settled. This was built on a foundation of marsh clay to begin with, and, what is worse, the wall had no footing course. These circumstances alone would have been enough to convict any builder of want of common care; but when we go on to read that the wall was composed of a filling-in of loose rubble and brickbats, and was faced with stone without bonders, all we wonder is that it had ever stood. It is stated that the wall gave no premonitory warnings of weakness beyond a few cracks, and that other instances of insecure houses exist in New York, from which it is difficult to expel the tenants, despite of the warning by the police. Under these circumstances it cannot be wondered at that tumble-down houses are run up, seeing that people are willing, as our American contemporary says, to risk their lives.

An important letter appears in the same journal from Mr. Henry L. Gay, the architect of the Rockford Court-house, from which we gather some interesting particulars of the cause of the accident, which, as our readers may be aware, entailed the loss of a dozen lives. We may just remind our readers that the building was of dressed stone, and its main feature was a square dome rising from an attic on the roof, and this dome rested in front on the outer wall, but had no support at the sides and rear, except by two iron columns 30ft. high under the inner corners. These carried girders, upon which were brick walls carrying the dome. The iron columns stood upon brick walls or piers 30ft. high in the first story, and these piers suddenly gave way when the superstructure of the dome was being erected. We may as well premise here that the superintendence of the structure was not under the architect, that one of the building committee performed that task, and that the architect had merely been called in now and then. Such are the bare facts of a disaster which has created a great deal of inquiry, and upon which a committee of experts and General Smith have been engaged in making an elaborate report, which ascribe several faults to the design.

From the particulars now furnished from the architect we learn the fact that considerable alterations had been made from the original designs. The bearing walls or "piers," as they have been called, were intended to carry a light construction with metal cornices, and which was afterwards changed to stone. The modifications were, Mr. Gay says, made on the plans, and figures were inserted. The bearing walls were increased in thickness to the length of four bricks to the particular measurement of 2ft. 10½in. The walls at the bearing points, originally double, with air space, were made solid, and bond stones were inserted, and the section furnished of the wall, as designed, shows that the bearing stones of the iron columns are in line with the pier or wall, and does not project beyond it, as in the case of the executed work, where the inside of the bearing stone rests about 9 or 10in. over the arch. It may be as well to say that these "piers" are called walls by the architect, who says he never considered them to be isolated piers, but continued walls, which, at the centre of a positive weight above, was increased to form pilasters. This is important, as the figures given by experts have been based, it is said, on isolated piers. Mr. Gay asserts that under his supposition of a wall acting as a beam transferring a part of its weight to the adjoining supports, and as designed, the walls would have amply carried the weight of ten tons per square foot. The extreme weight, it is said, should not have been over 130 tons; and in actual construction two sides of the pavilion were increased from 20in. to 2ft. 6in., unknown

to the architect. Mr. Gay also explains that the bond-stones, or headers, were specified every fifth course of brick, so bonded that the outer face of brick helped to sustain the weight. The bricks also were specified to be the "hardest burnt bricks." Referring to the sections before us we find that the basement story was 13ft. 6in., and the first story 17ft. 6in. to the floor line, making a total of 31ft. as the height of these piers supporting the iron columns of the second story. Iron beams and brick arching abutted against these piers at the first and second floor levels, and assisted to stay them. The architect says he was not consulted by the experts at all; that the plans they were furnished with for their examination were not those supplied by him to the contractor, but were the old originals, and that the contractor suppressed his plans, and withheld every instruction that would criminate him. As far as we can form any opinion the immediate cause of failure was the unequal distribution of pressure by the improper setting of the bearing stone on which the iron column rested; it was not placed centrally with the line or axis of pressure, and part of it rested on cinder concrete, contrary to specification. It is estimated also that the column sustained, at the time of failure, 102 tons, and that the greatest part of this weight was at a point between the concrete and brickwork, and just over the skew-back of arch. There is no doubt also the arches exercised a thrust, and the weight being concentrated just within the line of bearing, assisted to throw over the base of the column. The lesson is one pregnant with caution to the architect to see to his bearing piers in such cases. We certainly cannot commend the architectural design of carrying a central dome on mere props, entirely without relation to the internal structure, especially at such a height. The construction was, to say the least, highly risky, and looks too much like a feat of poisoning in the air a heavy structure. Added to which also we find the contractor had not carried out the architect's instructions, and that, indeed, the plans were unjustifiably ignored. We are glad for the profession Mr. Gay has come forward to place his case in a fair light, and to disclaim the personal responsibility which he should justly have borne.

ARCHITECTURAL SCIENCE CLASS.

IN awarding to the candidates of this class the merits due to them we have found the task less difficult than on the former occasion. The increasing complexity of the subjects, and the greater demand on the skill and time of the student, have had the very natural tendency of reducing the number of competitors. As might have been expected, the weaker in the race lagged behind, or dropped out altogether; some have lost patience, and others have become faint-hearted, and ceased to contend. The result has been that the choice has fallen between narrow limits, and, in our opinion, the following candidates are entitled to the three prizes:—

ADVANCED CLASS.

"S. M. E." (C. F. Walker, Upper Britton-street, New Brompton, Chatham, Kent).

ELEMENTARY CLASS.

"Aubery" (J. E. Batchelor, Cambridge-terrace, Great Marlow).

"T." (T. Newbold, Micklegate, York).

We have pleasure also in acknowledging the merits of the replies of the following competitors:—In the Elementary Class the names of "A. L. B.," "J. S. A. M.," and "Wilhelminus" are worthy of special recognition; while, in the Advanced Class, the replies of "Attneave," "H. R. P.," "Voguelin," "Sigma," and "Pro Rege et Lege" have been marked by great merit.

ROYAL ARCHÆOLOGICAL INSTITUTE.

VISIT TO HEREFORD.

[FROM OUR OWN REPORTER.]

THE Hereford gathering of the Royal Archæological Institute will be generally regarded by members and others as a successful one. Numerically, it holds high rank in the thirty-four meetings held by the Institute in various parts of the country. The primary purpose of such a society has been well kept in view by the working members, and many of the visits have been characterised by a careful examination of the objects to be inspected, and deliberate testing of theories by the concrete facts. A notable instance of this concentration of thought was afforded in the devotion of an afternoon and morning almost entirely to a few monuments in Hereford Cathedral, every detail and moulding in the famous "Cantilupe shrine" being diligently scanned, and compared with its other features and with examples elsewhere, to afford bases for possible conjectures as to its origin and date. Some of the excursions seem, however, to have been arranged as much for the enjoyment of the charming forest, hill, and riverside scenery of Herefordshire as for the elucidation of our national history by the light of the monuments scattered around the county. It is possible that one or two of the programmes might have been rearranged with advantage archæologically. From this point of view it is a pity that a day was not allotted to visits to old-world Ledbury; the Roman camp on the summit of Herefordshire Beacon, which, on a clear day, would have afforded a panorama over the west midlands, and a capacity for picnicking, extensive enough to have recompensed, for the scramble to its summit, the visitor of feeblest antiquarian proclivities; and the noble abbey of Malvern—all within the compass of a long day's work by a judicious utilisation of the railway as far as Ledbury. The attendance at the evening meetings in the Free Library was meagre—a circumstance partly accounted for and justified by the small number of papers that had been prepared with special reference to the objects aimed at in such a congress. The hearty spirit with which the citizens, clergy, and county gentlemen received the Institute, was exemplified as much in the manner in which every church, castle, and hall, or, to adopt Mercian parlance for the last-mentioned, each "court," was thrown open for inspection, and its most highly-regarded features indicated, as in the truly English hospitality everywhere extended to the visitors. For this, as well as for more important reasons, the Institute meeting of 1877 will be pleasantly remembered by all who took part in it.

The leading characteristic of the proceedings in Herefordshire has, however, been the examination of a series of village churches scarcely altered from the time of their building, in the early years of the 12th, the 11th, perhaps the 10th, or even antecedent centuries. The successive remoteness of founding—Madley, Ludlow (round), Kilpeck, Brewardine, Moccas, and Deerhurst—was very nearly followed in the rotation of visits. Definite impressions were thus afforded of the Basilical arrangement, and the modes of construction and ornamentation of the earlier "English" churches—the term "English" here including the Anglo-Norman period, and, we may almost conclusively add, that of the Anglo-Saxons.

The centre for next year's annual meeting is fixed at Northampton—a town situated nearly at the southern focus of an elliptic that would enclose in its description a district abounding in examples of a comparatively simple type of broad-spined chureb, rebuilt (occasionally planned) and completed within the period of development of the Decorated style. A wide historical gap will thus intervene between the ecclesiastico-architectonic features of the one congress and its predecessor, but yet affording a promise of a continuance, in some fashion, of an instructive course of study of actual examples *in situ*.

Reverting from generalities to particulars, we resume our journalistic narrative of the week's proceedings at Hereford at the point to which we brought it in our last—namely, with

details as to the events that occurred on the then-preceding

THURSDAY.

THE ANNUAL MEETING

Of the Institute was held at 9.30 a.m., the President, Lord Talbot de Malahide, occupying the chair. The annual report was read by Mr. A. Hartshorne, Secretary. The members were in it congratulated on the great success of last autumn's meeting at Colchester, both from archæological and financial viewpoints. The finances of the Institute were, indeed, in a flourishing condition, but at the same time the council recognised the need for exercising a watchful economy, and had decided to remove the printing of the journal from Messrs. Bradbury and Evans to Mr. Pollard, of Exeter, thereby effecting a saving of £80 a year. Reference was made to the loss the Institute had sustained in the death of Mr. Joseph Burt; also to the fact that £350 had been raised for his widow's benefit; and passed on to note in fitting terms the deaths of Mr. T. Talbot Bury, Mr. Edmund Sharpe, and Dr. Matcham.

The Rev. C. BINGHAM moved the adoption of the report, stating that he never knew a year in the history of the Institute when the death-roll was a more painful one than the past one; indeed, under such losses he almost wondered how the Institute could still be carried forward in its work.

Mr. FAIRLESS BARBER, in seconding the adoption of the report, feelingly alluded to the gap caused in the ranks of archæologists by the decease of Mr. Edmund Sharpe, whose immense patience in research, careful thought and anxiety to impart his knowledge in a clear form to those with whom he was brought in contact, especially to young architectural students, he spoke of as almost unparalleled. It was interesting to learn that at Old Cleeve Abbey, concerning the position of the refectory of which Mr. Sharpe maintained for long a dispute with many of his colleagues, excavations were made shortly before his decease which showed that his theory was correct. Mr. Sharpe's labours and researches would, in his published works at least, continue to bear much good fruit in popularising archæological science.

The report was then adopted, as was also the balance-sheet, which was of a satisfactory character.

THE NEXT MEETING PLACE

(For the annual congress of 1878) was, on the motion of Mr. A. H. Bloxam, seconded by the Rev. Mr. Dyke, decided to be at Northampton, a letter of invitation from the Mayor and Corporation of that borough having first been read by Mr. Hartshorne. Durham was also suggested as a suitable centre, as the only city which has not yet been visited, otherwise than for part of a day, by the Institute. The President suggested that in future excursions should not be planned for long distances from the centre, and that it would be well to give at least two days to sectional meetings; in neglecting the work of sections for long excursions he feared the Institute might be losing its character for useful and solid inquiry.

Mr. STEPHEN TUCKER referred to the serious illness of Mr. J. H. Parker, C.B., and proposed that the secretary write to him, expressing the regret of the members at the cause which deprived them of his presence and assistance, and their hope that with restored health he may be able to be with them on some future occasion.

Sir GILBERT SCOTT expressed his sorrow at Mr. Parker's illness; and the motion having been seconded by Mr. BLOXAM, and spoken to by the PRESIDENT, was unanimously adopted, and the proceedings terminated.

PERAMBULATION OF HEREFORD.

The members then visited some of the principal objects of interest in the city, proceeding first to *All Saints' Church*, near its centre. The lofty spire, 212ft. in height, attracted notice as much from its threateningly dilapidated state (many of the angle quoins having fallen, causing a serrated sky outline) as from its fine proportions. Opposite Broad-street, at the south entrance to the chancel, is a beautiful Decorated porch, with cinque-foiled cusplings of the characteristic fulness at the angles, so common in Herefordshire churches of its

period. This porch appears to have been removed from the nave entrance, a few yards further west, in the succeeding century, when the existing square-headed common-place additions to the nave supplanted it. On entering the church, Sir Gilbert Scott explained that the earliest documentary evidence is that it was given to a hospital at Vienna—an inexplicably long distance away—by Edward I. It seems to have been immediately rebuilt, for the existing fabric is precisely of the character one would expect to be erected at such a date, and a north chancel aisle was added, not being built, as the returning eaves to the north aisle showed, contemporaneously, but so closely afterwards as to be substantially in the same style. Probably some one left money to endow a chantry, while the church was in course of rebuilding, and the work of providing a suitable chapel for masses was immediately undertaken. The western window has upright mullions passing directly through it, and is treated in so rigid and harsh a manner that it would be regarded as late fifteenth or sixteenth century work, were it not that similar windows of well-authenticated date occur in other churches of the district, notably at Brecon. The pulpit-stalls are very good, and the pulpit is a splendid seventeenth century erection, having a fine sounding-board, which he (Sir Gilbert) trusted would be spared by restorers. The church is, all could see, in a wretched state of repair, and the tower walls much cracked. It was stated in the church that Sir G. G. Scott has prepared plans for its restoration, and that the works to be presently undertaken will cost about £1,000.

THE CATHEDRAL.

A return was made to the cathedral, some of the party staying outside a while to leisurely inspect its exterior from various standpoints. The north-east and north-west aspects are the most pleasing. The Lady Chapel, as restored by Cottingham, in neo-Early English, has an elegance faintly recalling parts of Ely, or even Salisbury; but there is too great mechanicality in the modern details to be altogether agreeable. The grandly-proportioned central tower forms a beautiful centre to the edifice, although the ball-flower ornament on the leading lines is so freely repeated as to break the surfaces into series of dots and short lines, distracting attention and impairing the effect. Old prints show the steeple finished by a lead-covered wooden spire of clumsy outline; this was removed by Wyatt during his tamperings with the fabric, as he feared for the safety of the structure. Its loss is not to be regretted, and, looking to the fact that the failing foundations of this tower have been a source of apprehension for several centuries, and that there are now slight cracks visible on the north side of the inner lantern, it is dubious whether it will bear the spire at one time proposed by Sir G. G. Scott to be added. The pair of buttresses which run at each angle of the tower are finished off with a pinnacle, and a larger one springs from the embattled parapet behind these; the groups of pinnacles are fair reproductions of fourteenth-century work—are, indeed, very good for the date at which they were added, fifty years since, and give a distinctive character to the outline; but they do not group sufficiently well with each other, nor blend with the square steeple; some additional clustered members appear to be needed at the point of juncture with the tower. This, by the way, on the older engravings is finished off with a machicolation similar to those of St. Alban's Abbey. Whilst we are jotting down a few of the more interesting details of and about the edifice, we must not omit mention of the three series of cloisters, two of which are incomplete, lying on the southern side. Those to the west alone are strictly speaking entitled to the name; they form three sides of a square, and are Late Decorated in style of tracery. Parallel to these on the east are the bishop's cloisters, of which but two arcaded and covered walks of at least a century later in style than the preceding remain. At the end are scanty foundations of the decagonal chapter-house. The third cloisters, or rather covered quadrangle walks, are at the vicar's choral-house, to the S.E., and are late fifteenth-century in style, and almost perfect.

Entering the church we proceeded to the old bone of contention, the Cantilupe shrine, and about an hour was spent by many members in endeavouring to fix its date and the reason for its singular form, and the great disparity in the character of the sculpture upon it. Some of this is most spirited and free, other parts are of very sorry tooling. That the tomb is a thirteenth-century work all agree; that it commemorates Cantilupe the fully-armed figures of Knights Templars in bas-relief on the plinth appear to prove, as well as the unbroken line of tradition. The most feasible explanation of the poor sculptured blocks introduced at intervals, and the generally inferior workmanship of the upper part, is that suggested by Mr. Hartshorne, that the lower stage was carved by a sculptor, and the upper part was left to a stonemason of the period—the “art-inspired workman”—to complete, and that the fractures caused by the four well-authenticated removals were repaired as well as possible. The screen erected some fifteen years since from Sir G. G. Scott's designs, between the nave and choir, is worthy of examination. It is extremely light in design, and of an English type of late thirteenth-century work, consisting of five pointed arches, divided by slender shafts, and with a lofty gable and cross above the central one. In the upper compartments are seven bronze figures. The screen is bronzed and highly gilt and studded with polished vitreous substances, and stones in mosaics and on the bosses; it was wrought by hand, and made by Messrs. Skidmore, of Coventry, who also executed the massive corona, which is suspended by a bracket of twisted wrought iron from the lantern. The walls supporting the central tower exhibited, as Sir Gilbert Scott pointed out *in situ*, a combination of lightness and strength to which there is no parallel example. The walls are hollow; the inner one, for a height of 26ft. above the turning of the arches from the great piers at the crossing, consists on every side of piers of compact masonry, bonded by a cross-bar of stone, the intermediate spaces being left open, so as to form a series of gigantic stone gratings, on which the upper stages of the tower rest. Cottingham revealed this unique piece of Transitional Norman construction, which had been concealed by a sixteenth-century piece of fan-vaulting. A noteworthy feature in the choir is the fact that it is separated from the Lady Chapel by an open 13th-century arcade, a column standing exactly in the centre of the choir behind the reredos. The tympanum springing from this pillar thus shuts out the line of sight from end of nave to Lady Chapel in a very awkward manner. It had a perfectly plain surface till within the past 30 years, when the younger Cottingham designed a representation of the martyred King Ethelbert (to whom the Cathedral is dedicated) to cover it. The carving, although highly ornate, has a pleasing appearance. In the south-east transept (or Audry chapel) hangs an ancient map of the world, engrossed and coloured on a sheet of vellum 18ft. square, not later than 1314, by an ecclesiastic named Richard de Haldingham and Lafford, afterwards Archdeacon of Reading. Rivers, seas, and countries are interlined with grotesque sketches of men and animals, and the ideas of comparative topography are ludicrous in the extreme, the Holy Land occupying about a third of the map, which is circular in form.

Mr. BLOXAM conducted the members in a tour of inspection round the monuments in the Cathedral, stating first that many of the effigies of bishops could be dismissed in a single sentence, for they were alike in style, size, and appearance, and seemed to have been the work of the same sculptor, and to have been executed in the 14th century. They are arranged under a series of cusped arches, recessed around the cathedral. The other effigies were not always named or dated, but could be identified, to some extent, by the style of dress, beards, &c., for even bishops, like other men, had their fashions. Many of this series represented the bishops in full canonicals, mitred, and with veiled pastoral staffs, and some of the later monuments had the same peculiarity. This was usually supposed to signify that the bishop was also an abbot, but this could hardly have been the case in so many instances at Hereford. Mr.

Bloxam called attention to the effigy of Dr. Lindsell, who, as a post-Reformation bishop (he held the see for one year, 1633-4), wore the square cap which was such an abomination to the Puritans, and also a full beard—a resumption of the custom which existed in the 13th and 14th centuries, after which all priests, for several generations, were close-shaven in accordance with canonical rules. The deans' monuments were numerous and interesting; that inscribed and known as Dean Borew's, on the south wall of the Lady Chapel, was the most beautiful piece of sculpture in the Cathedral, the disposal of the robes being especially graceful. It was not, however, Borew's effigy, for he died in 1462, whereas the style of this was of 1362, or, more probably, just prior to 1350—besides, this figure was bearded, whereas Borew must have been shaven, and would be so represented. The canopy, which bears in the chamfer of the label Borew's rebus (a series of boars with sprigs of rue in their mouths), was unquestionably his, but the monument did not fit its position, and had evidently been shifted. Some discussion arose as to the effigy of “Humphrey Bohun,” which Mr. Bloxam said was clothed with the cyclas, a peculiar habit worn on horseback c. 1315-40, being longer behind than in front, and of which not a dozen sculptured representations exist in the kingdom. It was not that of Bohun. Mr. Tucker (Rouge Croix) said that, from a genealogical point of view, it was important that monuments should be correctly named. This could not be, for there were but three Humphrey de Bohuns, who were buried at Saffron Walden, York, and Pleshey, and the arms of the adjacent monument of “Johanna de Bohun” were not those of that family but of the Pyses, of Herefordshire. The destruction of records monumental in this edifice had been deplorable, and it was the most bare in this respect of the English cathedrals—except in its effigies. In 1645 no less than 166 brasses were uprooted from this cathedral, and in 1684 a great many more were found to have been taken away. When the tower fell in 1786 there was a most wholesale destruction of monuments in the Cathedral; Mr. Havergal had heard of one man metamorphosing part of a brass into a mason's square. A great many passed into the hands of the late John Bowyer Nicholls, and last Saturday Mr. John Bruce Nicholls, who had some of these brasses intact on a wall, said he would be delighted to carry out his father's intention of restoring them to the Cathedral. They were 22 in number. Church-restorers ought to preserve the monuments of the dead, and where they did interfere with architectural arrangements they should be replaced elsewhere. If they must be destroyed the inscriptions should be copied into the parish register. Mr. Lee Warner also spoke of the importance of preserving church monuments. Mr. Hartshorne said that the monument referred to by Mr. Tucker presented a very peculiar example of tomb canopying. It was Decorated in detail, but Perpendicular in style of arrangement. From the style of the work he should think it was of the time of Edward II.

Leaving the Cathedral the members passed, by a cloister on the north side of the south-east transept, to the *College of Vicars Choral*, a low series of buildings erected around a cloistered quadrangle in 1462-72, of poor Perpendicular design. Passing through these they visited the *Castle Green*, Mr. J. E. Clark pointing out the traces of the earthworks and moat of the castle, now utterly destroyed. The green has been rented of the Crown by the Corporation, levelled, and rendered ornamental, and adorned with a memorial obelisk to Earl Nelson. It now forms a pleasant promenade. *St. Ethelbert's Hospital*, a one-storied almshouse for women, having been peeped into, and a few fragments of 16th century carvings seen, they proceeded on to *St. Peter's Church*, a large church with lofty spire, said to have been founded by Walter de Lacy in 1070. We noted nothing, however, in the church giving evidence of workmanship earlier than the reign of Edward III. It is a ceiled and galleried church containing some fairly-designed Perpendicular stalls. To the south of chancel is a chapel, now bricked up. The *Market House* in

the open space behind was far more interesting. It is a large half-timbered house erected in 1621, and forms the only remaining part of a mass of oak-framed houses known as Butchers' Row, that formerly divided the space into two narrow streets; it is adorned with grotesque carvings, and would, with its tarred oak quarterings, discoloured plaster, overhanging gabled stories and bay windows, richly carved bressummers and barge boards, warm tiles, and oddly corbelled stack of chimneys, and set as it is, withal, in a prominent position, be a charming subject for a sketch of "Old Hereford," were it not disfigured with glaring business advertisements, covering the whole of one side. We hear with some trepidation that it is in peril of being restored.

Some of the party passed on to the *Blackfriars Monastery and Cross*. The monastic buildings are now reduced to a few ivy-clad walls of fourteenth-century masonry. Close to them is the Friars' Preaching Cross, which was thirteen years since, as we see from photographs exhibited, a crumbling hexagonal structure with buttressed angles, connected by walling in which were cinque-foiled arches: in the centre of the internal space was the shape of a cross. What stands on the site is the conjectural reconstruction of the cross, made in 1864 in consequence of its threatening condition. On the adjoining site of a Knights' Templars hall is the only private military hospital in the kingdom. This visit concluded the itineration.

We may note here that the other city churches are of little interest, having been rebuilt in recent years. The public buildings are not numerous, and include the Free Library, (the temporary head-quarters of the Institute), a large building with a domestic Venetian dress, next Broad-street, recently erected from Messrs. Kempson and Martin's designs. The Corn Exchange, close by, has a Corinthian frontage; the markets, in High-street, modern Italian; and opposite St. Peter's Church is the Shire Hall, one of Sir Robert Smirke's heavy adaptations of the Doric portico of the Temple of Theseus at Athens. About a mile westward from the centre of the town, at the angle of two roads, is the White Cross, an elegant pedestal and shaft of Decorated work, raised on a flight of eight steps, which, like the superstructure, are hexagonal on plan. It was erected at the close of the fourteenth century to commemorate the Black Plague of 1347, and has been restored by Sir Gilbert Scott, who has added to it a cross, with floriated head and arms. In general effect the cross is not unlike that of Geddington, Northants, illustrated by us last autumn.

EXCURSION TO SUTTON WALLS AND MARDEN.

The afternoon was spent in a carriage excursion to a series of villages within five miles northward of Hereford. None of the sites visited presented any features of even secondary antiquarian importance, the outing deriving its charm from the succession of fine views of the surrounding district, and the blue outlines of the Black Mountains on the Welsh border, and the Malvern Hills, and the peeps at the oak-framed-and-plaster granges, set in the midst of the orchards and hop grounds for which the county is famed; the farm-houses on the route are generally in a sad state of decay from damp and neglect, but therefore the more picturesque and attractive—to those who have no intention of dwelling in them.

We pass *Holmer Church*, a thirteenth-century edifice, having a detached tower, the upper stage of which is half-timbered, on the south-west. A halt is made at *Pipe-and-Lyde Church*, a small edifice restored about two years since by Mr. Kempson, architect, of Hereford, containing traces of Late Early English work in the deeply splayed windows, massive walls, and the font; and also a good fifteenth-century carved rood beam. A tower has been added to westward, in place of the central bell turret, and is about to be finished with a low broach spire. The fourteenth-century church at *Moreton-on-Lugg*, seen soon afterwards, was also restored in 1866-7, and a tower and broach spire added.

Marden Church is a very complete edifice set on the very brink of the river Lugg. The chancel of this church is spacious, deep, and apsidal ended; into it a range of Decorated windows throw an abundance of light. The

tower at the south-western angle of nave has its entrance on the east face: it is finished with pinnacles and a good spire, built, like all in the district, of the local old-red sandstone. The chief curiosity is the well in the church, a small circular pillar a few inches in height is embedded in the floor of the west end of the nave, just behind the font; it is pierced by a well about a foot across, probably fed from the river, and erroneously said never to fail. In the chancel is a fine brass, date 1614, of Lady Chute, showing a matron in richly-brocaded dress and ruff, and with hair trimmed into a crest; by her side are two figures of daughters. Some handsome linen-pattern seating of the time of Henry VIII. has been worked up into benches. The vicar (the Rev. T. H. Clutton-Brock) gave the history of the church, which is said to have been founded by King Offa, who resided close by in a palace on Sutton Walls, as an expiation for the treacherous assassination (A.D. 782) of his guest and daughter's suitor, Ethelbert, King of East Anglia, on the spot where the body was buried. When the body was exhumed from its temporary resting-place at Marden, the dissevered head fell and sunk in the ground, and the spring now marked by the well appeared. The vicar told other traditions concerning the great bell of Offa, said to be sunk in the river just behind the church, and to resist all efforts to raise it, chiming when the bells in the steeple are rung—accounted for by the distinct echo from the water's surface. A bell of copper, 14in. in diameter, has been recovered from a pond near by, and was popularly regarded as King Offa's dinner bell. (It was exhibited in the Institute's temporary museum, and identified as a mediæval sanctus bell.)

At *Freen's Court*—the ancient seat of the Lingsens, but now fallen into a state of dilapidation, owing to its being below the overflow level of the stream, and occupied by a small farmer—some stained glass armorial bearings of about 1500, a Jacobean panelled ceiling and oak wainscoting were inspected, and the ascent was made of the ancient entrenched camp of *Sutton Walls*, the residence of the Mercian kings, until Mercia was merged in Wessex. No traces of buildings remain on the hill, which occupies an isolated position, and is scarped round and protected by ditches, which form entrances and paths to the summit. The Rev. Prebendary Scarth, from the strong nature of the defences, believed it to be a Silurian camp; it was not on a Roman road, and was too high for their purposes, and too strongly ramparted to have been the work of the Saxons. Mr. Bloxam regretted that the crops made a careful investigation of the site impracticable. He believed it to be one of the systems of strongholds thrown up and held by the Silures on their borders, although it might have been subsequently occupied by the Saxons.

On the way home a visit was paid to the very small church of *Sutton St. Nicholas*, having much Transitional work, and a late timber porch, as yet untampered with except by the whitewasher. A semi-circular seat cut in the solid masonry of a window sill on the south side of chancel excited some discussion as to whether it was a peculiar form of sedilia, or merely a recent alteration; its appearance, and local testimony, favoured the former theory. Mr. Bloxam drew attention to a piscina and the remains of an altar in the east wall of nave, south side, and to an aumbry on the opposite side. These were the traces of one of the rood-loft altars that have only recently been examined by archaeologists, and the history of which took the inquirer back into the early Greek church of the 4th century. They were still in use in many parts of the Continent (notably in Antwerp Cathedral), but were comparatively lately noted in English churches. This concluded the out-of-doors programme, and the party returned to Hereford by way of Ailstone-hill.

In the evening a *Conversazione* was held in the Free Library, when the Rev. Canon Jebb read an erudite and humorous but somewhat lengthy paper on "Mexican Antiquities," in which he spoke in high terms of the constructional and decorative qualities of the buildings erected by the ancient people, and regretted the wholesale destruction of the past 300 years, which has almost annihilated their traces. The

hieroglyphic system of written communication, and their calendar, were more complete, and displayed great ingenuity.

FRIDAY.

The most popular and pleasant excursion of the Congress took place on Friday, the route lying through a wooded and hilly district of great natural beauty to the south-west of Hereford. More than a hundred ladies and gentlemen joined in the excursion, which was made in a number of well-appointed carriages. Crossing the Wye just below the city, a pleasant two hours' drive, through a beautifully-wooded hilly country, formerly the Forest of Haywood, brought us to

KILPECK,

where the church, a most interesting and beautiful specimen of an unaltered Norman building, received the careful examination it deserves. The triple division into nave, choir, and sanctuary is clearly marked in this little church. The chief charm lies in the grotesque carvings with which the exterior is ornamented. A corbel table runs completely round the building under the eaves, crossing the west façade at the same level; it is supported by about eighty corbels, each sculptured with a different design, the series including such varied subjects as a monster devouring an infant, children embracing each other, furies, horses, rams, and birds' heads, interlaced serpents, the Agnus Dei, the familiar wreathed foliage, and others; all are spiritedly, and often humorously, executed, with the free use of fine parallel horizontal lines or "combs" so characteristic of pure Norman work, in a very compact and finely-granulated sandstone, that resists the effects of time remarkably well. The series would furnish many hints in grotesquerie to young architects, although one of the representations is so contrary to modern notions of the delicate purity of thought befitting the ornaments of a house of prayer that we are surprised no iconoclastic churchwarden or rector, during the centuries that it has evidently remained on the southern angle of choir and chancel roof-juncture, has cut it away. The west front has no opening in it; a central buttress runs up to support this corbelled string-course, above which is a circular-headed window, with a fine interlaced cable ornament occupying the reveal. From the ends and centre of the course on this west front project three brackets, each about 3ft. in length, in the form of crocodiles' heads, with twisted heads, recalling a similar but larger bracket on the detached Norman tower at Bury St. Edmund's. The southern doorway is remarkably fine; on the tympanum is a representation of the Tree of Life, but without any living figures introduced; the shafts are carved with large dragons, birds, and foliage, and appear a little later than the other work, although of the same stone; above and surrounding the tympanum are the signs of the zodiac, amusingly caricatured, and another row of emblems above, the significance of which we could not decipher, the mouldings between and around being filled with zig-zag, billet, and stud mouldings. The interior was a little disappointing after so much display of original treatment outside; the best feature is the first or choir arch, on which, beneath rich wave mouldings, are carved a succession of acolytes, marked with the stigmata in hands and feet, and each bearing one of the emblems—candle, bell, chalice, patten, &c.—of a procession; these figures Mr. Bloxam spoke of as unique, and only to be paralleled by those on the west front of Rochester Cathedral, and at Shrewsbury Abbey. He thought they could not be more recent in execution than 1150. The chancel arch—that opening into the apse—is much plainer. The windows, except those in the apse and west end, have evidently been tampered with, but are all narrow and deeply splayed inwards into the very thick walls. The font is an immense basin of pudding stone, 4½ft. across, but remarkably shallow; it is set on a modern base. A plain Georgian west gallery of unvarnished wood looks somewhat out of character, but cannot be dispensed with, as the little church will barely seat its Sunday congregations. Mr. A. J. Beresford Hope, M.P., having called the members' attention to the great completeness with which they had pictured before them an

ideal Norman Church, the Rev. Archer Clive stated that the carvings were mended and necessary repairs executed in 1848, under the supervision of the late Mr. Cottingham. It had been stated by "Murray" that the church was "rebuilt, each stone being numbered before removal, and replaced in its former position;" but this was incorrect, except as to a very small part of the walling. At that time the present double bell-turret was added, in style corresponding with the main building. The beautiful south door was formerly half-concealed by a wooden porch, which at length got so seriously out of repair that it was removed.

Kilpeck Castle, the ruins of which occupy a large conical mound opposite the west end of the church, was next visited. It is reduced to two large fragments, both nearly veiled in ivy; the southern is part of the keep, with the indications of a filled-up well close by; the other to the north is part of the domestic apartments, the piece including a great fireplace cavity and the square base of a window. Mr. G. T. Clark, of Dowlais, gave an address on the summit of the mound, in which he said that the hill was almost entirely artificial. The top was levelled and surrounded with a very deep moat and a large base court, while several other platforms might be seen from where they stood, stretching away in lines of defence into the neighbouring country. Its construction compelled him to think the castle was an addition planted into the consolidated remains of an ancient British camp. Before the Normans did this the defences might have been of stone added by the Saxons, but were most probably at first only a timber palisade. The church below was built by the Norman barons, and the farm buildings that they could see a few fields off to the south were formed partly of the remains of the little priory founded by Hugh FitzNorman, in 1134, as a cell to Gloucester Abbey. From the segment of wall remaining in front of him they could all see that the keep was not, like that of Ludlow, a rectangle, but resembled that at Arundel and the majority of those founded on an artificial mound, in being a circular shell. There were evidences that the walls extended all round the hill, and the bit of walling to the right was part of the living rooms. Mr. Beresford Hope suggested that the name *Kilpeck* was Celtic in origin. The Rev. James Davies, of Hereford, said the *Kilpeck* church was dedicated to Saints Mary and David. Most of the dedications in the district were to Cimbro-British saints. The adjacent village of *St. Devereux* (whose little church lay just below the castle hill), investigation had shown, was not renamed from the great Norman family from *Evreux*, who held lands in the Marches, but from the British Saint David or *Dwy*, Latinised into *Dubricius*, and gradually corrupted to its present form.

EWYAS HAROLD CHURCH AND CASTLE were next visited. The Church, an Early English edifice, was restored nine years since. The south porch is a good specimen of Decorated oak framing, and in the graveyard is a cross of the same period, which has been recently re-completed. On the north wall of the chancel is an effigy of a Lady de la Warr, who died 1320; the right hand is represented as holding a heart, and a reliquary close by is said to contain, or have contained, a human heart. The canopy has blind cusping, and, together with the figure, bears in its details evidences of having been fashioned very soon after the lady's death.

The "Castle" consists merely of a conical hill of considerable height, defended by a moat and ditches, and covered with trees and brushwood. The top having been reached after a stiff scramble, Mr. Clark directed notice to the fact that, as at *Kilpeck*, the church lay nearly beneath the mound, and to the east of it. This mound was more artificial than that; but although the English could command a large amount of labour, they always availed themselves, in the selection of a site, of natural advantages. Here they occupied the tongue of a promontory, surrounded on two sides by little brooks, and the plan of working was first to dig a deep trench across the neck of land, throwing it on the centre. A moat was made around, and when the mound had sufficiently consolidated, it was scarped, and made as steep as possible. A good way beck from the con-

fluence a ditch was cut from stream to stream, so that cattle could be depastured under protection. The summit was at first defended by stockades, not unlike a modern New Zealand pah, and as time went on, and the land became more settled, stone defences were raised. Such mounds as he had described were formed within such distances throughout the Marches that their possessors could see if the Welsh were out plundering, and could descend upon them wherever they saw the smoke of a burning homestead. The dates of these earthworks could be approximately guessed at, because they knew that Queen *Ethelfleda*, in the reign of King *Alfred*, erected 30 castles, many of which could still be traced, and were found to be Norman in appearance in the lowest masonry. Again, *Newark* was defended, and was apparently completed, within a few months of commencement. Similar earthworks abound in Normandy, the home of the Northmen. All these, as well as the majority of their names, pointed to the conclusion that the series of earthworks, which protected the western Marches, were Teutonic, and not Celtic, in origin. That similar works existed at two Welsh fortresses, never subdued till Edward I.'s time, was a difficulty in the problem which he could not quite surmount. The Marches being centres of large estates, William the Conqueror wisely gave the estates with the castles to his barons. The tenants by degrees came to regard these as their natural defenders against the Welsh, and thus the feudal system was strengthened.

ABBEY DORE.

A drive over a hill into the Golden Valley brought the members to *Abbey Dore Church*—the only relic of a Cistercian establishment, on the banks of the *Dore*, founded in the reign of Henry I., by Robert de *Ewias*. The parish church consists of the choir and transepts of the ancient church, and the aisles, which pass completely round the building, the square-enclosed space behind the altar being divided into five chapels. The chapels and aisles are vaulted, but the nave and transepts have been covered in with a wooden roof. In the churchyard to the west are the ruined columns and traces of walls of the nave, which, as usual in Cistercian churches, extended about twice as far as the choir. All the structural details are of Transitional and Early English character. An interesting feature, as Mr. Beresford Hope pointed out, is that, in 1642, Lord *Scudamore* restored the building, re-roofing the transepts, building a large square embattled tower in five stages to the west of eastern transept, and adding within an excellent Renaissance chancel screen and pews. He also replaced the altar-table—an immense slab of marble, standing on three clusters of massive circular pillars, about 2ft. in height. Mr. Hope also mentioned, purely as an archaeological fact bearing on a burning political question of the present day, that in the consecration service read in the church by Bishop *Wren* in 1634, the bishop was directed to stand with his face to the table in the midst of the people. Mr. Fairless *Barber* pointed out that the chapter-house, refectory, and other conventual buildings were here placed to the south (for convenience of drainage into the river), instead of, as in most establishments of the Cistercian order, to the north. The square-sided ambulatory showed what *Bylands*—once the largest of these abbeys—must have been when entire. Before leaving *Abbey Dore* several piscinæ, sediliæ, and a reliquary in the chapels and north transept, and two mutilated monuments of knights in chain armour were examined, and also the scanty ruins of the chapter-house at the side of the south transept; and the members proceeded to *Whitfield*, where they were sumptuously entertained by the Rev. *Archer Clive*, and spent a leisure unarchæological hour of enjoyment in the library, grounds, and richly-wooded park, as idiosyncrasies prompted. During the return journey

MADLEY CHURCH,

now in the restorer's hands, was visited. It is one of the largest in the county, measuring 170ft. by 68ft., and consists of lofty clerestoried nave of six bays and aisles, with a chapel annexed to the south aisle, and a chancel ending in polygonal apse as at *Marden*, with crypt beneath, and a west tower, with

embattled roof—the greater part of the edifice being of a late Decorated character. At present the builder (*Mr. Collins*, of *Tewkesbury*.) is in possession; the floors are up, the fittings and some windows removed, and an effort of the imagination is needed to see the building as a complete fabric.

Mr. Kempson, of *Hereford*, the architect engaged in the restoration, stated that he had found remains of a Norman window in the north porch, and also a continuous wall foundation just within part of the arcade, indicating that a small cruciform Norman church occupied the centre of the site. The three western bays are larger than the other three, and a break in the walls at this point shows the addition of the fourteenth century to the church of the preceding one. The clerestory windows were throughout deeply splayed. Somewhat later a south chapel and a west tower were added to the church.—The windows in the chancel do not range with each other, and are somewhat varied in character; the ball-flower ornaments, we noticed, are sparingly introduced in the tracery and on the sedilia. The crypt beneath is accessible by staircases on either side of the arch, and has a good clustered central shaft, from which fan groining radiates with charming effect; a number of pointed windows give a full light that is unusual in an underground chapel. In the churchyard are two headless crosses about 8ft. or 9ft. in height, including the steps on which they stand.—*Mr. Beresford-Hope* trusted that *Mr. Kempson* would carry out the work now going on in a way that would show that restoration did not mean destruction. They had that day seen a series of churches illustrative and forming a compendium of the history of our ecclesiastical progress and change of thought and fashion. First was *Kilpeck*, which was completed nearly as they had seen it, in the earliest period after the Norman conquest. *Abbey Dore* was of the thirteenth century, but showed also what restoration was like 200 years ago; and, lastly, they saw around them *Madley*, a thoroughly English church of the last period of fourteenth century architecture, now in course of restoration.

The return journey was then made by way of *Cleghonger* and *Belmont*, where a very complete Benedictine monastery for 40 monks and pro-cathedral have been erected by *Mr. Wegg-Prosser* from *Pugin's* designs, in the Decorated style. The cathedral is 113ft. in length, and consists of nave, chancel, transepts, and unfinished central tower. The east window has very elaborate tracery, and has been fitted with stained glass by *Messrs. Hardman*, of *Birmingham*.

In the evening the architectural section met at the *Free Library*, when a paper was read by *Sir Gilbert Scott* on "The Seventeenth Century Restoration of *Abbey Dore Church*."

SATURDAY.

The excursion for the day was by rail to and from *Ross*, and thence by carriage to *Goodrich Castle*, and was less numerously attended than the previous meetings. Three miles from *Ross Station* a halt was made at

WALFORD CHURCH.

This small church is a fair example of what may be hoped for should the *Anti-Restoration Society's* views again come into favour with the public. No architect appears to have had a hand for generations in the repairs executed about it, and the conservative mode in which it has been treated has certainly the advantage of enabling the story of its life to be read very easily. As *Sir John MacLean* said in the short address he gave, it exhibits traces of the successive work of all periods from Transitional Norman to Churchwarden's Gothic. The tower, a Perpendicular one, stands on the north side, and was formerly capped by a spire which was blown down nearly 70 years since, and has not been replaced. The east windows in nave and north chapel are of very plain type of Decorated, almost approaching the Perpendicular in the use of long mullions. The west gallery appears by an inscription to have been added in 1754, and the high pews are of the same date, of fair workmanship. Near the crown of the chancel arch on either side are corbels which appear to have supported the rood loft, which, if so, must have been placed unusually high. However,

the theory is supported by the position of the rood stairs, and the rector stated that under the plaster in the south wall of nave is a rood loft piscina of early type. Suspended on a nail over the chancel arch is the helmet actually worn (and not as usual, a mere heraldic emblem) by Col. Kyrle, a noted Parliamentarian general and the uncle of the Man of Ross. The nave is crossed beneath the coiled roof by several rough and crooked beams which add to the quaintness of the interior, and on the wall are traces of a fresco apparently of Adam and Eve, but only the trunk of the tree and the nether limbs of the erring couple are discernible. Careful removal of the many coats of whitewash would probably be rewarded by the bringing to light of a complete series of 15th century mural paintings. The rector mentioned the curious local custom of using the south porch for funerals, and that the corpse is then brought round the north aisle and chapel to the nave for the reading of the burial service.

Crossing the Kerne bridge, a fine many-arched and buttressed structure of stone, spanning the Wye, we came directly to

FLANESFORD PRIORY.

This ancient Augustinian building has been applied to more useful purposes as part of a farmstead. We approached it, warily picking our way through the mire, towards that part of the heavy stone structure which showed its former use by the foliated crosses on its gables. At the east end is a singular double flight of steps leading to a door; but, although the masonry looks ancient, this may have been altered to better serve its purpose as a granary. The upper window spaces are pointed, and were once adorned with decorated tracery of similar pattern to that at Walford Church, on the opposite bank of the Wye; but the stonework is broken away, and the whole filled with wooden louvres. Walking round we see that the original west front has been enclosed by a later addition—probably since the secularisation—and it now forms an internal wall face, showing a pointed doorway, with canopied niches on either side, and a window base above each, dimly suggesting the White Ladies' in the Tything, Worcester. The north wall has along it a row of built-in coeval corbels—possibly a provision for future extension, or to support a lean-to roof, or even an external gallery, as the marks on the wall suggest. The principal apartment has lost its internal floor, and is now littered with straw and manure; even in its degraded state, and open from substructure to roof, the proportions and form are good, and mental restoration would be easy but for one puzzling feature. A piscina in the south wall, nearly under the break in the roof where the central cross stands, would indicate an altar but that exactly opposite it is an immense fire-place, which must have been inconveniently close to officiating priests, even if, as was suggested by Mr. Kempson, of Hereford, a parclose divided chapel from kitchen. Many of the corbels are of a pleasing form almost confined to this district. The table is supported by a clustered triplet of slender shafts or "fangs," ending in a point. The windows in the L-shaped projection at the east end are more plain in treatment than the others, and suggest that the domestic offices were located there. Scarcely anything is known as to the history of this little priory (which has been previously almost overlooked by archaeologists), except that it was founded in 1347 by Richard Talbot and his wife, the heiress of Goodrich, and that it passed into the hands of the Crown at the Dissolution, and only the name of the last prior is preserved.

GOODRICH CASTLE

Was the terminus of the day's wanderings, and a pleasant hour or two was spent in its courtyard, rambling over the very perfect ruins or ascending the keep, in some cases perhaps, for the sake rather of the view to be thereby obtained than to more closely examine the jointing and workmanship of the Normans. The general outline of the castle is a parallelogram of buildings erected on the top of a small, high hill, and enclosed by a deep moat or fosse. At each angle is a circular tower, and on the south-west side an isolated square keep. This, the chief part of the castle, is the oldest part of the structure, and is evi-

dently Norman in style, the fact that no mention of Goodrich appears in "Doomsday Book" precluding the suggestion that it may be of Saxon workmanship. It is built of Forest of Dean stone, and at a later period—probably about the time of John Talbot, first Earl of Shrewsbury, who held it in Henry VI.'s reign—a double shafted window has been clumsily inserted into the circular banded window on the inner face. In the face of the keep towards the quadrangle is the low acutely-pointed opening into what was once the dungeon, an apartment 15ft. square, leading into a smaller cell, with the scantiest possible provision for light and air. It was added by Richard Talbot, by licence from Edward III. Most of the castle is thoroughly Edwardian in character. The angle towers are round, and are built of stone excavated on the spot, the quarry being made to serve as an immense moat to the building, which is, it will be seen, built into the solid rock. Somewhat later than these in style is the chapel, which adjoins right side of entrance gate; the few details of the ruins identifiable are mixed Early English and Decorated character. Between the chapel and the keep is an octagonal tower known as the watch tower, formerly occupied by the chaplain and warders; it is of great solidity of construction, and a covered passage in the wall remains leading from it to the south-western angle or garrison tower. On the other side of the keep is the north or ladies' tower, which is Late Perpendicular in style; it is planted on the brow of a steep ridge, so as to be the most defensive part of the tower. The state apartments occupy the western side of the building, and resemble in plan, to a remarkable degree, those at Ludlow. The resemblance goes, indeed, further, to similarity in sites, for each is planted on a notched platform of rock, with its steepest side next a stream. The entrance to the hall from the quadrangle at Goodrich is placed on the left of the great hall, but is not approached by a flight of steps as in the Salopian Marche's stronghold. The buttery and serving rooms occupy the space still further to the left, and on the right are the living apartments. A clustered thirteenth-century shaft in that portion of the internal façade beneath the baronial dwelling—dividing an Early circular opening into two lancets and an unpierced spandrel—is in its creeper-and-lichen-wreathed ruin one of the most charming features of Goodrich, and a pleasing contrast to the stern solidity of the keep, bare of any kindly softening touch from Nature's hand, save the moss that adheres to the exposed footings. The windows of the great hall are very similar in place and position to those of the more important ones at Ludlow. The corbels have been treated alike, and the buttery hatches, through which the viands were brought to table, are the same. We cannot detect, under the ivy on the north face, any trace of a ladies' gallery, and it is probable that this provision for the comfort of the fair inmates of the little garrison did not exist in Goodrich. The fire-place is a conspicuous feature of the great room, and is doubtless a late addition. As at Ludlow, the internal floors and roofs have disappeared from the castle; all that exists is the bare masonry. We have left a notice of the entrance to the castle quad till the last. It exhibits a skill in arrangement for security rarely equalled. From the external mound the quad is entered over a drawbridge across the moat, covered by arrow slits in either flanking tower. This leads to a dark passage 50ft. in depth. About 11ft. within are traces of a massive gate and curtain, over which are machicolations for pouring down boiling water or molten lead on assailants' heads. At intervals of 7ft. further there hung two portcullises, the intervening space being defended by loopholes and machicolations. About 2ft. more inward was another strong gate, and about 6ft. beyond this, on the right, a small door once existed, which gave access to the long passage to be seen in the thickness of the wall. This leads to the eastern tower. At the present day the entry is directly over the draw-bridge, through the first long straight passage, into the centre of the quad. Goodrich Castle, we were told, on the authority of Mr. Taylor's guide-book, read aloud by Mr. Owen within its walls, is probably,

in its origin, the work of Hugh de Laey, the founder of Llanton Abbey, who held feudals way over Hereford and Monmouth during the reign of William Rufus. It seems, after De Lacy's death (without issue, in 1131), to have passed into the hands of the King, for in the 11th year of Henry II. (1165) it was held by Wm. Marshall, Earl of Pembroke, who paid about 30s. annually to the crown for possession. The male line of the Marshalls became extinct in 1245. The seal of Walter, the last Earl of Pembroke but one, was found amongst the ruins some years since. The constableness of the fortress passed into the hands of the De Valences, and through them to John Comyn. Elizabeth Comyn, one of his three children, became the wife of Richard Talbot, by which union Goodrich Castle became possessed by the Shrewsbury family, and was for some centuries their principal seat. It derives most renown from having been the seat of the invincible Sir John Talbot, to whom it descended in 1420. Talbot was for years the terror and scourge of France, and was victorious in 24 battles and skirmishes. His career, and that of his son, Lord Lisle, closed at the battle of Chatillon. A petition presented in 1423 against Sir John by the male inhabitants of the hundred of Wormlow (in which division the castle is situated) shows him to have been an ungracious and overbearing neighbour at home. The castle remained in possession of the Talbots till 1616, when it passed by marriage into that of the Dukes of Kent, and from them by purchase to the ancestor of Mrs. Marriot, the present possessor. It is not known to have had its immense power of resistance tested till the Great Rebellion, when it was at first occupied by the Parliament, but in 1646 was garrisoned for the King by Sir Richard Lingley. After an eighteen weeks' siege by Colonels Birch and Kyrle the garrison capitulated, when it was reduced to its present ruined state.—The President (Lord Talbot de Malahide), after the reading of its history, of which the above is an abstract, expressed the personal interest which he felt as the lineal descendant of the Talbots, in this their most important stronghold, and the members returned by a fresh route to Ross, passing on the way the modern castellated mansion of Goodrich Court, which occupies a height separated only by a narrow dingle from the castle. Close to the Wye-bridge is Wilton Castle, and it is to be regretted time did not permit of a closer inspection than could be obtained from the carriages, for it dates from the days of Stephen, although almost rebuilt in Elizabeth's time, and was burnt by the treason of the garrison within, during the Civil War, before Charles I.'s downfall. The Wye-bridge adjoining has itself a history, the irregular appearance of the arch next the Wilton shore being due to a rebuilding subsequent to its being broken down in 1644 to impede the onward march of the Parliamentarians. In one of the triangular recesses over a buttress, on the up-stream side of the bridge, is a four-sided stone pillar carrying sun dials.

ROSS.

“But Wye
To Ross her course directs, and, well her name to show,
Oft windeth in her way, as back she meant to go.
Meander, who is said so intricate to be,
Hath not so many nooks or cranking winds as she.”

Thus we adjudged with diffuse Drayton, as taking a quiet stroll after luncheon on the terraces of the Royal Hotel, and the adjacent well-named Prospect, we “viewed the landscape o'er.” “Sylvan Wye” appeared as a horseshoe-shaped ribbon below, and then, doubled and twisted in each direction to the points where its course was lost to sight behind the hills. Returning to the town for more purely archaeological purposes, we find memorials and reminders of John Kyrle, the “Man of Ross,” of whom Pope has so eulogistically sang. Indeed, the town seems to live on the reputation for benevolence of this worthy townsman, and the very newspaper is named in honour of Kyrle. “The Prospect” was laid out by him on the cliff edge next the churchyard. Twelve of the elms he planted yet stand, though now showing signs of decay, for it is more than three half centuries since the “Man of Ross” died. A good Renaissance gateway, dated 1700, separates the Prospect from the churchyard.

SEA-SIDE RESIDENCE AT OSTEND, FOR THE KING OF THE BELGIANS—CHURCH OF ST. MARY, MIDDLESBROUGH.

OUR LITHOGRAPHIC ILLUSTRATIONS.

MARINE RESIDENCE FOR THE KING OF THE BELGIANS AT OSTEND.

The design which we publish to-day was prepared in accordance with instructions given by the King of the Belgians to Messrs. Lucas Bros. Ostend has always been a favourite seaside resort of the King of the Belgians, who has hitherto resided in a house of his own in the centre of the town. Some years ago, when the project for the demolition of the old fortifications was first mooted, and new streets and boulevards projected upon their site, the late King Leopold first commenced the erection of a palace on a rather large scale facing the sea. This, from various causes, was never carried higher than the first-floor level, and after remaining for years as a ruin, was sold for old materials. In the meantime, the old house, called by courtesy a palace, in the town, having become extremely insalubrious, the present King determined to erect a bathing chalet on the digue, and the present designs were carried out in furtherance of that idea. Since that time, however, the scheme has taken a larger form, and other buildings have been added. At about 150ft. away from the first pavilion, which is intended for the exclusive use of the King, a further pavilion almost similar, both in plan and in external design, has been erected for the use of the Queen, and the two are connected by means of a long glazed corridor and winter garden, having in the rear a spacious banquetting hall, richly decorated, and intended for state dinners, and in the basement below, which, in consequence of the slope of the ground, becomes a ground-floor story at the back, is extensive accommodation for the large staff of servants which are always sent from Brussels whenever the King resides at Ostend. In front is a broad terrace, about 400ft. long, communicating by flights of steps at either end with the sands; and in the rear, facing the boulevard, is a residence for the king's gentleman in waiting, and also a large range of stabling, with further rooms for servants. In order that the most recent sanitary arrangements might be adopted, and also that the work might be of the best quality, it was the wish of the King that the buildings should be erected by an English contractor, and the whole of the timber-work was framed together at Messrs. Lucas' works at Lowestoft. It was then taken to pieces and shipped direct to Ostend, where it was erected by the same staff of men who had prepared the work, the stone basement having been previously built by English workmen. The site being extremely exposed to wet and driving winds, and the local bricks being very porous, it was decided to construct the building solidly in timber, with a panelled face, and with internal plastering in the usual way, and as a further security there is a second skin of plaster midway in the depth of the studding. The soil being a dry shifting sand, the whole stands upon a block of concrete, and it is roofed in zinc laid upon boarding and felt; and, as a protection against great heat, the under sides of the rafters are lathed and plastered. The pavilion, which we now illus-

trate, was the only portion carried out by Messrs. Lucas. It was designed and built under the superintendance of Mr. W. J. Green, architect, of 8, Delahay-street, Westminster, who also designed the residence for the gentlemen in waiting, and from whose designs the stables, &c., are now being executed. In consequence of some local jealousy having been shown at the employment by the King of a foreign contractor and foreign workmen, it was determined that the rest of the work should be executed by Belgians, and the Queen's pavilion, with the winter garden and banquetting hall, were designed by Mons. Symon, Ingénieur des Ponts et Chaussées, under whose superintendance they were carried out, and who has immediate charge of the works now going on. The King's pavilion was furnished by Messrs. Jackson and Graham.

ST. MARY'S CHURCH, MIDDLESBRO'.

We give further details of this church which we described last week.

A NEW ADAPTATION OF CONCRETE TO BUILDING PURPOSES.

WE noticed, at the Exhibition of Sanitary Appliances, held last week at Manchester (of which full particulars will be found in to-day's *Public Health*) a model illustrating a new system of binding-in concrete, now being introduced by Mr. George A. Marsden, of Liverpool, which has several advantages, particularly in the facility it affords for the introduction of external ornament, which can hardly fail to secure for it the favourable consideration of architects, who have, up to the present, rather held back from the ordinary monolithic system on account of the difficulty of obtaining any other than flat external surfaces. The system, which differs entirely from any other yet introduced, consists in the use of slabs made either of concrete or clay of any desired size, and upon the bottom and end of each slab or tile is placed a flange extending outwards parallel with the main surface of the slab, so as to form a rebate or overlapping on the inner side of the next slab below it, and on the one side of it—thus interlocking in the most complete manner, and presenting when in position an uniform surface on each exterior of the wall. On the back of each slab stout eyes are moulded, and the slabs are connected with light iron dowels or clamps having bent ends which are inserted in the slots or eyes. When the external and internal slabs forming the wall are erected and secured by the iron tie, the arranged interlocking flanges are so perfect in action, in securing strength and firmness, that when only a small section of wall is erected, great force must be used to disturb it in the least. These remarks refer entirely to a temporary structure, one to be used for temporary purposes, and capable of being removed with ease, and without any damage to the slabs. In erecting a permanent building, it is intended to fill in the hollow space between the exterior and interior slabs with coarse concrete, which, when complete, will combine all the solidity of the monolithic mode of building, and with the addition of a casing of strong stone concrete slabs, will make, according to Mr. Marsden, one of the strongest erections that can possibly be built. A number of houses are now in course of erection in Blackpool, by the licensee of the patent in that district, Mr. Walker, a builder of that town. He is building these houses for himself, and having practically tested the cost of making these patent slabs, he is convinced that by this method a house can be built for a less sum than of bricks, and without taking into consideration the many additional advantages of this system over brickwork—its weather-resisting qualities—its increased strength and rapidity of construction, the facilities for the flues, heating or ventilating arrangements, &c. Mr. Marsden has also just undertaken to build some memorial schools at Bolton on the system, and plans are now being prepared by Messrs. Parslow and Clarke, architects, of Liverpool, to build a villa at Southport on the same principle. The judges of the Sanitary Exhibition at Manchester awarded a certificate of merit to the invention, and a very favourable opinion of it seemed to be entertained by all who inspected the model.

A PLEA FOR THE PICTURESQUE.

MR. J. HINE, F.R.I.B.A., read a paper last week, before the Devonshire Association at Kingsbridge, entitled, "A Plea for the Picturesque," in the course of which he maintained that, in the restoration of old churches and in the repair of old villages they had been dreadfully shorn of the picturesque—for example, there was Kingsbridge. It was a town of considerable antiquity, its history stretching back nearly to the Norman conquest, yet it presented the appearance of a New England settlement. It was clean, it was new, but it was not picturesque, and as a sort of climax it had a tetotum sort of clock-tower. Totnes and Dartmouth, on the contrary, possessed not a few relics of their ancient architectural glories. Totnes was the Chester of Devonshire, and had reason to be proud of its early history and of its remains, both ecclesiastical and domestic. Some admirable sketches of these relics were shown, and elicited warm approval, and the writer appealed earnestly to the authorities, and to the owners of these remains, to keep them from the fate of their fellows that have perished. After descanting on the beauties of Dartmouth and its surroundings, the writer went on to deplore that a new town was elbowing the old one out. Buckfastleigh was another place that had two old cottages of great antiquarian interest; though the village was dreadfully unpicturesque generally. In the discussion which followed Prof. Hodgson, as a staunch utilitarian, said there was no truth in the notion that there was an antagonism between utilitarianism and the picturesque, for Mr. John Stuart Mill, who might be said to be the inventor of the word, had employed the latter part of his life in the endeavour to preserve the picturesque. It was unfortunate that old buildings were given to decay, but though they might have age they were not bound to have ugliness. In conclusion, he remarked that some buildings could not be said to be complete until the architect was hung at the doorposts. (Loud laughter.) Mr. Parfitt protested against the slavish copying of the three conventional styles of architecture, and wanted to know why the architects of the 19th century could not strike out a style of their own, and thus mark the present age. Mr. Worth defended the architects from this reproach, and said that it was true that modern building was too often undertaken without regard to the purpose for which houses were intended. In this part of the county, for example, hundreds of houses were built with no intent on the part of builder or architect to comply with the necessities of those by whom they were intended to be occupied. The Ven. Archdeacon Earle added that so long as he had a comfortable house he did not mind whether it was Elizabethan or not. Mr. Hine replying, instanced several eminent architects, notably Sir Charles Barry, who had "left their mark upon the age by the invention of perfectly new and distinct types of architecture." (?)

COMPETITIONS.

STALYBRIDGE.—The directors of the Stalybridge Oddfellows' Hall and Social Institute Company having offered premiums for the two best designs for an Oddfellows' Hall and Social Club, to cost about £2,000, four sets of drawings were sent in. Mr. Amos Lee, borough surveyor, acted as professional adviser to the Board, when it was decided that the plans bearing motto "Adaptation" were the best. Mr. Gregory Gill, architect, of The Hollins, Stalybridge, was the author, and the work has been entrusted to his care. The foundations have already been laid, and the superstructure will be proceeded with as quick as possible. The building is in the Italian Gothic style, plain, but characteristically treated with stock bricks and York stone dressings. It is situated in one of the most central positions of the town, and will form a very conspicuous and pleasing feature in a town not overstocked with buildings of much architectural attraction.

In our report last week, on p. 141 of the new sewage works at Southport, we omitted to mention that the blue bricks are being supplied by Mr. Joseph Hamblett, of West Bromwich.

"Who taught that heaven-directed spire to rise?
The Man of Ross, each lisp'ing babe replies."

The matter-of-fact stones tell a different tale to the lisp'ing babes quoted by the poet, for the spire must, from its outline, have been heaven-directed a full century before John Kyrle's birth. Possibly he repaired it, but all trace of such work has disappeared, for in 1852 it was struck by lightning and was partly rebuilt. Waiving our querulous criticisms for the nonce we glance once more at the fine spire, more than 200ft. in height, and enter the church itself. The nave is at present open to the sky, and occupied by the contractors, Messrs. Pearson and Son, who, under the direction of Mr. Nicholson, of Hereford, diocesan architect, are raising the walls and putting upon them a new barrel-vaulted roof. In the north-western corner, under a hoarding, are a number of displaced monuments, including an effigy of one of the Rudhalls, accoutred in armour, with flowing wig and open Spanish boots, with the figure of his wife by his side. These bear date 1636. By them is the marble statue of the Royalist general, Rudhall, who appears in the semi-garb of a Roman soldier, with long locks, peaked beard and moustache of the period, and carrying a wooden sword—altogether a singular combination of monumental anachronisms. A more pleasing peculiarity of the church is the pair of feathery elms, offshoots from one of those planted by Kyrle, which have sprung through the flooring near the window at the end of the south aisle. High up in the chancel arch, on the north side, has just been discovered a piscina, which occasioned some discussion as to its use. It probably marks the position of a rood-loft altar. The chancel, like the nave, has been much restored, but contains traces of Decorated and Perpendicular workmanship. A large mural tablet records the virtues of "The Man of Ross," and during the visit of the Institute the parish registers are displayed, the second volume being open at a page whereon we read under the head of Burials, "1724, Nou. 20, John Kyrle." *Toujours Kyrle!* We hasten from the church to see, not his residence, but the market-place—a singular Renaissance building, supported on twisted circular stone columns, with an arcade above. High up on the chief front is the bust, and scarcely recognisable bust, of the Second Charles. There is little else in Ross worth notice, except a few timbered houses, and we return to Hereford by train in the evening.

MONDAY.

The carriage excursions of the Congress were closed by a visit to Credenhill, Moccas, and Bredwardine. The first divergence from the main road was made to

CREDENHILL.

The church, a 13th-century building, with some traces of earlier work here and there, was restored last year by Mr. Nicholson, diocesan architect. On either side of the chancel arch are side passages from nave to chancel. These have been opened out, and the heads filled with cinquefoil cusping, in accordance with what is supposed to have been the original intention. The westernmost window in the south wall of chancel is a double lancet, filled with stained glass of the Edwardian period, of rich purple and ruby tints. The original glazing is still almost perfect, and represents the two Saints, Thomas à Becket and Thomas de Cantilupe, each wearing the mitre and episcopal robes, and carrying a crozier. The fashion of dress and the fleur-de-lis bordering fixes the period of the glass at the middle of the 14th century. The south porch is large and well carved, and has been cut from a single piece of oak, the wings being sawn nearly through and twisted back. The ancient camp on the top of the same steep hill was next visited, fine views being obtained of the surrounding country as we plodded up the narrow Roman stone paths, about 6ft. wide, to the summit, 715ft. high. This includes 56 acres of rough forest, surrounded by a mound and two precipitous ditches, in which are three entrances. One side has been injured by the quarrying of the stone, but the works

have been abandoned on account of the difficulties encountered in the transportation of the material. No coins or other proofs of the Roman occupation have been found. Credenhill is probably an ancient British entrenchment, made use of by the Romans as an earthwork for their fortified camp at Kenchester. While descending the hill a slight detour was made to look at the "Prophet's Oak" in the rectory garden, a noble tree of great height and girth, which, tradition says, loses a branch when any member of the family is about to die. The rector's hospitable proffer of refreshing cider and perry was thankfully accepted, and the move was made towards

BYFORD CHURCH.

A First Transitional building with a decidedly Norman feeling about the details. In the thirteenth century a south aisle was added, and at a later period a transeptal Lady Chapel on the same side. The clustered columns supporting the arcade of the Lady Chapel are very light in appearance, and the capitals and responds above are deep and elegant. On the east wall of the Lady Chapel are a pair of projecting corbels, probably once occupied by statues of St. Joseph and the Virgin, placed on either side of the altar; on the west wall is a singular recess, possibly for a lamp. Byford Court, opposite the church, is a fair example of a modernised English mansion of Henry VIII.'s time; in its construction native oak timber was freely used.

MORNINGTON-ON-WYE.

The church is a fifteenth-century building restored, according to the dates on the porch, font, and screen, in 1679-80. Mr. Beresford-Hope gave an address within the church, speaking of it as a fine example of the survival, almost amounting to a revival, of Gothic in the seventeenth century, the double transomed windows and the woodwork generally being very good examples for so late a period. The chancel screen was especially noticeable; there were many pre-Reformation screens, but scarcely any after that date; that at Ingestre, completed in 1689, was the only instance that occurred to him. A hasty visit was paid to the manor house close by, formerly the residence of Sir Thomas Tompkin, who restored the church as it now appears; it contains some good panelled ceilings and timber work. In the principal room is a fine piece of carving, having upon it "T. L. T. 1658," and the following Latin jingle, which is also carved upon the old manor house at Leominster—

Vive Deo gratias,
Crimini mundatus,
Toti mundi tumulatus,
Semper transire peratus.

From Byford a long drive brought us to

MOCCAS,

where, after partaking of the hospitality of the rector, the Rev. Sir George Cornwall, we proceeded to inspect the church, which stands in the park. It is a good example of an Early Norman church, consisting of nave, choir, and apsidal chancel, in plan precisely like Kilpeck, but there is very little ornament displayed, probably owing to the fact that the building stone employed in its erection is a very porous travertine, quarried on the estate; it is soft in working, and hardens on exposure, but will not readily bear tooling, except in the simplest of chamfers. All the decorative features here are of limestone, brought from a distance for the purpose. The south door has a lintel deeply hatched with the diagonal lines frequently employed by Norman builders; above is a tympanum, showing a Tree of Life, with two animals, apparently mules, in the act of devouring human figures, who are suspended head downwards. On the walled-up north door is a somewhat similar subject in a tympanum, but there only one quadruped is introduced besides the mystic tree. The chancel arches are circular, and ornamented with the wave pattern. The windows are set very much higher in the walls than in the companion church at Kilpeck. The church was repaired by Westmacott about 1803, and a few years since it was re-restored from Sir Gilbert Scott's design. The organ stands in the tower arch, which is at the west end; it has a new case, a copy of one of the Norfolk examples, and therefore scarcely in keeping with its surroundings. The Rev. Sir G. Cornwall read a paper

(which we shall reproduce in an early number), in which he suggested a very early date for the church, and said that some years ago he found the site and traces of the old Castle of Moccas. Mr. S. J. Tucker identified some stained glass arms in the window as that of one of Sir G. Cornwall's ancestors, one of the De Fresnes of Moccas, and remarked that the coat was one of the oldest and best-identified in the kingdom, containing the lion of the King of the Romans (the son of King John). Mr. Beresford-Hope said this was evidently a church built prior to the days when the distinction between the choir and chancel was obliterated. There was a strong family likeness between this church and the one at Kilpeck; there was in both a display of very ingenious carving and planning; but one did not look to buildings of the Norman period for high art, and certainly not for Academy models. Any criticism on their relative appearance, or fribbling æsthetic commentary upon and comparison of them, he should look upon as a waste of words. The interest of Norman churches to archæologists was not their intrinsic beauty, but their associations and history. Kilpeck and Moccas were types each of their own phase of Norman, and each was interesting because real, and thus comparisons between them would simply come in the way of true art, and would but be a piece of shallow sentimentality. Mr. Hartshorne spoke upon a singular effigy in the centre of the chancel, which he pronounced to be probably Hugh de Freynes, who died in 1329. The effigy is attired in scales of horn—the only example of the kind in England, although used from the days of the Assyrians upwards, with a singular garment forming a link between the surcoat and cyclas, with the arms of the wearer upon it. It has two swords, and was cross-legged. In the general discussion afterwards it is generally agreed that this church is earlier than that of Kilpeck, although it is possible the comparative plainness may be due to the isolation or poverty of the district, added to the difficulty of procuring stone suitable for the sculptor's art.

The members examined in the garden of the Court a singular sun-dial, to which there is said to be only one parallel—that at Kinlet, Worcestershire. It is of sandstone, is of singular form—the east and west faces being cut away into a blind St. Andrew's cross, and stands on a high pedestal. The sides are deeply cut, scored, and lined so as to form a great number of time-indicators—as many as 16 subsidiary dial-faces being formed out of the east and west sides, many more on the south, and even two, only available after 8 p.m. on midsummer nights, on the north side, while the top also bears a principal dial. It is ornamented with the planetary and zodiacal signs and several inscriptions, of which the most decipherable is:—

Time passed and stayeth not;
Death cometh and waited not.
Aneud to-day and slack not;
To-morrow thou can not. 1550.

In leaving the park the "giant oak," the largest in this county of fine trees, was visited. It still bears leaves, but is much decayed, and the centre has been burnt out by an accidental fire; yet a tightly-stretched tape across the trunk, 5ft. from the ground, showed a circumference of 36ft. 2in., without allowing for the bulging of the side that has succumbed to the elements.

BREDWARDINE CHURCH.

This was the only church visited during the congress in which there is no chancel arch. Instead of it there is a large buttress projecting into the south wall. Opposite to this the tower thrusts itself into the church. Judging from the poor mason's work and debased style of the upper stage and embattled parapet of the steeple, at least the upper part was rebuilt about a century since. The base is plain and massive in construction. Some travertine stone has been employed in the church, in which there is a good deal of the plainest Norman work, including some herring-bone work in the walls, and a little zig-zag carving on the lintel and imposts of the south door; the tympanum is quite plain. The church has just been restored and benched under the direction of Mr. Nicholson, diocesan architect. There appear some traces of an arch at the east end, once opening, without doubt, into an

apse. The windows are insertions of the 13th and 14th centuries. In the chancel are two effigies; that on the north is the earlier—probably, from its chain armour and basinet, carved in commemoration of a knight about 1380; the other, on the south side, is dressed in plate armour and skirt, and is about 70 years later in style. Messrs. Hartshorne and Tucker spoke of the peculiarities of these figures, the latter gentleman remarking that the collar of SS., worn by the one on the south side, denoted that he was a Lancastrian knight of about Edward IV.'s time. The first SS. collar was probably that given to Henry IV. by his father, John of Gaunt, who received it from his mother, Philippa of Hainault, who in turn gained it, as the mark of the Order of San Salvador, from her father, Philip of Arragon. It is now only worn by a privileged few, including her Majesty's judges and heralds, but was during the Wars of the Roses the badge of the Lancastrians. Mr. Beresford-Hope pointed out that the chancel is strongly deflected from the central line of the nave. Some discussion arose as to whether the tower was part of the original Norman church, possibly a north transept, built over and enclosed at a slightly later date. This theory was broached by Sir G. Cornwall, and it was suggested again that the Norman church had a bell turret or tower at the intersection, and that this became unsafe, was removed, and the present steeple constructed. No concurrence of views was arrived at, and the party returned to Hereford, the lateness of the hour and a slight accident to one of the vehicles rendering inexpedient the completion of the programme by visits to the churches of Staunton-on-Wye and Mansell Lacey.

In the evening the concluding meeting of the congress was held in the Woolhope room, when votes of thanks were passed by the members of the Institute to the annual president and local committee, the Lord Mayor and Corporation, and the ladies of Hereford, for the cordial hospitality shown by all.

TUESDAY.

The proceedings of the Institute had nominally closed, but a large proportion of the members availed themselves of an invitation to join the Worcester Diocesan Architectural and Archaeological Society in a visit to

TEWKESBURY ABBEY.

The members of the two societies met at the Abbey at noon, and Sir Edmund Lechmere, Bart., M.P. as chairman of the local restoration committee, welcomed the party, and introduced to them Mr. Thomas Blashill, of London, who had kindly undertaken to describe the abbey and the works now being carried out in it under the direction of Sir G. G. Scott. Mr. Blashill at once commenced his duties as guide, making a systematic perambulation within and without the abbey, propounding a theory as to the order of changes in the mode of building, and directing attention to the structural evidences in demonstration thereof. Under the central tower Mr. Blashill read a paper on the abbey (which we shall probably give in an early issue), the processional circuit—a necessarily slow tour from the great numbers of the combined party—being resumed afterwards. The edifice is temporarily divided at the intersection by hoardings during the progress of the works of restoration (which are being carried out by Mr. Thomas Collins, contractor, of Tewkesbury), so that it is not easy to get a general idea of the building. The walls of the choir, pillars and piers, and the western bays of the nave have been cleansed from whitewash and repaired. The bosses in the vaulting of the choir, tower, transepts, and the eastern bays of nave have been treated in gold, vermilion, and blue, in accordance with the traces of ancient colour. The remainder of the nave bosses are dealt with less ornately, and the spandrels and web of the choir-roof have been coloured in salmon, blue-grey and similar neutral tints. The floors have been removed, and the surface is laid with a thick bed of concrete, on which it is proposed to lay, as funds shall permit, specially designed encaustic tiling, showing the armorial bearings of the Clare, De Spencer, De Brien, Beauchamp, and other noble families buried in the abbey. These will be based on the coats on nume-

rous ancient tiles discovered during the re-flooring, which have been carefully preserved. The removal of plaster and whitewash from the remainder of the abbey walls is at present in progress, and also the re-roofing and restoration of a thirteenth century chapel, opening out of the north ambulatory—the latter being undertaken by the order of Freemasons. Other contemplated works are the repairing of the flooring in the transepts, ambulatories, and chapels; the provision of suitable furniture; the refitting of the seven ancient choir clerestory windows; and, "if considered suitable to the style of the abbey," the erection of a reredos. The works, which are estimated to cost about £6,000, in addition to the sums already expended, are not proceeding so rapidly as they would otherwise do, on account of the insufficiency of the funds.

Mr. BLASHILL commenced his itineration of the abbey by inviting the visitors to view the grand west front. This consists of an immense arch, emphasised by six deeply recessed members; in the centre is a Late Norman doorway, the entire space above being filled with a Perpendicular window. The arch, which thus forms a vestibule, is flanked by the north and south aisle walls, supporting two tiers of blind arcading in the spandrels and terminal turrets, to which, in the 15th century, bulbous spirelets have been added. The original plan was probably to screen the aisle ends as at Lincoln, with two large western towers, but Mr. Blashill said that cuttings into the casing masonry showed that, if designed, these flanking towers were never commenced, and that there was no foundation for supposing this arch was intended ultimately to become an internal vestibule. Returning to the nave, Mr. Blashill pointed out the great height (30ft.) of the massive Norman circular columns, the plain triforium and clerestory above, and the beautiful 14th century groined roof. The plan of the existing building is a nave of 8 bays, with north and south aisles, a choir surrounded by a chevette of chapels, and transepts, the intersection being marked by a massive square tower of very fully-developed 12th century work. On the north side, next the ambulatory, is a roofless vestibule leading into the chancel of a Lady Chapel; its nave has been destroyed. At the east end of the abbey was a Lady Chapel, the foundations of which have been found, and are to be excavated. Tewkesbury is one of a group of three Benedictine abbeys, the other two being Gloucester and Pershore, which bear tokens of having been designed at the same period, and by the same hand. Mr. Blashill broached a theory as to the construction and development of the ambulatory, and series of chapels now surrounding the choir, which he fairly established by the traces on the work itself. This was that, to provide more room, the monks built, in the 14th century, a new aisle round the choir, and in place of the three small chapels of the old aisle, they constructed six radiating chapels and a vestry. After this was done they decided to rebuild the arches and upper part of the choir, and to put up a groined roof. When this was done the spandrels of the aisle vaulting were found to project below the new acutely-pointed arches in an unsightly way. They therefore covered most of these spandrels with a light diaper pattern, leaving the eastern one bare, as it now remains, because it was effectually concealed by the high reredos, that has now disappeared. Vaulted ceilings were then added to the rest of the church. In reply to questions, Mr. Medland (from the office of Sir Gilbert Scott) explained that the canted form of the new altar steps had been adopted as a matter of convenience. The reredos that once existed was known to have been filled with sculpture, and many figures have been found buried under the flooring which may have come from it. The painted glass in the clerestory windows of the choir contains heraldry, which gives a somewhat later date in the 14th century than the details of the tracery would have suggested. Mr. Gambier Parry pointed out the resemblance between these windows and the great eastern one at Gloucester Cathedral. They saw here the effects of very positive colouring on the vaulted roof above them (in the choir), and he trusted they would have no more of it. Any one who should attempt to touch with a brush

the splendid old frescoes on the walls—more especially that in the Warwick Chapel—ought to be turned neck and crop out of the abbey. Mr. Blashill explained that Sir Gilbert Scott has only reproduced the old colouring that remained under the whitewash on the bosses. One boss in the north transept has been left unrestored as a sample of how far this colouring went. As to that under the central tower, he was informed that Sir Gilbert himself considers it too vivid, and it will be toned down. Some of the bosses were of wood. All the large gilt suns of York so freely employed in the decoration were of oak, held up by strong iron pins. In showing the chantry chapels Mr. Blashill urged that the most elaborate of these, decorated with fine tracery and rich pendants, should not be called the "Warwick," but the Beauchamp Chapel, as its foundress did not marry the second Earl Warwick till long after its erection. Some discussion arose with reference to the kneeling figure of the last of the Despencers over the Trinity Chapel, it being shown that the substructure of the chantry is of later workmanship than the upper part and figure. Whether the monument has been removed, or simply the base of the building restored, was debated, but no unity of opinion was arrived at. In one of the larger south-eastern chapels is arranged a museum of coins, small figures, corbels, tiles, and other fragments, discovered in the course of the restoration works. After examining the singular north Lady Chapel, the visitors went outside the abbey, examining closely the great flying buttress thrown over this chapel to the choir wall in the 14th century, the traces of the Lady Chapel at the east end, the beautiful remains of the panelled work of the 13th and 15th century cloisters let into the south wall, and the fragments of the domestic buildings. Mr. Blashill also directed attention to the flamboyant south aisle with windows, remarking that these and the chevette of radiating chapels suggested the employment of a Continental architect during the middle of the 14th century, to superintend the alterations for the works.

The subsequent public luncheon at the Town Hall was not rendered more digestible by a bad quarter of an hour that followed its consumption, owing to the caterer's audibly-expressed suspicions that some of the company were leaving without paying their shot—a doubt explicable by the circumstance that no tickets were issued, and the waiters collected the half-crowns in an unsystematic manner. Having relieved our minds by parting words more plain than pleasant, we gave a second and hurried glance at the varied specimens of half-timbered houses with which Tewkesbury High-street is still to a large extent lined, and took our places on a steamboat, which, after a short trip down the Avon and Severn, was brought-to at

DEERHURST,

Gloucestershire, where we at once proceeded to the parish church. Its out-of-the-way situation has caused Deerhurst to be somewhat overlooked, but it is worthy of more leisurely and detailed study than could be bestowed upon it in the hour and a-half at the disposal of the party. The church was restored about 18 years since by the late Mr. Slater, and the work gives evidence of the care taken to simply clear accretions from the originally rude, uncoursed masonry, leaving exposed large blocks and slabs of a harder stone which run through and bond the walls together. A Latin inscription, dug up many years since on the site of the chancel, and now preserved in the Ashmolean Museum at Oxford, states that this church, "hunc regum aulam," was dedicated by Earl Odo, who, there is historical proof, died in 1056. The parts of the church that can be referred to that date comprise the nave and west tower. The nave is narrow, and of high pitch, the ridge line on the face of the tower shows that its roof was once more steep. On the inner side of the east wall is built-in a round-headed arch. Outside are not only breaks in the masonry of this wall, but fragments of foundations beyond it, corroborating the tradition that the chancel was destroyed during the Wars of the Roses. A conjectural restoration from other early chancels on the banks of the Wye and Monnow would show it as a low

and deep polygonal apse, lighted by small circular—or, perhaps, only circular-headed—windows set high up in the walls, and well played inwards, with a corbel table beneath the roof, which might have been thatched with reeds from the Severn, not 200 yards away. The tower is of small dimensions and considerable height, divided internally into two parts by a solid wall. The entrance is beneath a circular arch, which, like that of the chancel, is of large voussoirs, slightly recessed from the general wall, and only chamfered away to a regular outline on the lower and outer surfaces, the superior face being left rough as received from the quarry. These semicircles of voussoirs end in drip stones, which are each rudely carved into the indication of a horse's head. The second stage of the tower is very lofty, and is divided by a double belfry window, consisting of three oblong blocks of stone, coarsely fluted. These are set near each other, forming pilasters, on which are fixed deep imposts and four long pieces of stone set ridge-wise against each other at an acute angle, so as to leave narrow triangular-headed openings between. Above these, in the next stage, is a deeply-splayed, circular-headed opening, and irregularly disposed about the faces of the tower are large slabs of stone. In the east and side walls of what now forms the chancel are other similar slabs, some triangular-headed and others plain. Those in the east wall are so disposed above the arch that once led to a chancel as to appear like walled-up pentagonal windows, but Mr. Slater showed that they pass completely through the thickness of the wall, so that they may be either bonds, as at first suggested, or they may be a clumsy attempt at ornament. The font is not the least remarkable feature of the church. The base is a hard, dark-coloured cylinder of limestone, and to it is found cemented another block of similar cylindrical form, but of a lighter-coloured stone and slightly larger. Its upper surface is hollowed out, affording sufficient area and depth for the practice of infant baptism by immersion. Both stones are graven with concentric patterns of connected circles similar to those on the "Runic" slabs and crosses of Cornwall and the Western Isles. So much about the earlier work as it remains; the subsequent alterations may be dismissed in a sentence or two. The nave had at first plain north and south walls, but early in the 13th century an extension was determined upon, and aisles were thrown out, extending to the west front of the tower, and the east wall of the nave, part of the original side walling of which was left, thus forming chapels at either end. The clustered piers have plain but well-moulded caps. In the following century the windows of the north aisle were gradually replaced by others of a commonplace type of flowing tracery; possibly those on the south side were altered in like fashion, but that work of reconstruction is now entirely effaced by a range of windows conceived in the baldest form of the revived Perpendicular of half a century ago, with upright mullions and diamond panes. At some early period the solid wall that now divides the tower into two unequal parts was constructed, and another story added; the smaller side has a saddle-backed roof, the larger a flat one, the whole being surrounded by the embattled parapet commonly added to Gloucestershire steeples at every post-Reformation date.

Mr. BLASHILL gave an address in the church, in which he spoke of the crude and archaic character of the masonry and carving as proofs that they really saw before them a church built at least 10 years prior to the Norman Conquest. He considered the chancel arch, and that of the tower, somewhat later than the building into which they were inserted; the horses' heads on the dripstones were paralleled in Malmesbury Abbey and one or two other later Norman buildings. The altar table and choir fittings were historically interesting, as they were almost the only existing examples of a church which still retained the chancel arrangements of the Puritan days; it was remarkable that neither at the Restoration, nor in the subsequent two centuries, these fittings had been altered back to the old and usual ecclesiastical style.

In reply to questions, the Rector (the

Rev. G. Butterworth) stated that there were some doubts as to what the dedicatory stone referred to as "hunc regum aulam," but after careful study of the fabric he strongly believed it to be Saxon in origin, and the building referred to. The only difficulty in the way of this theory was that it was not easy to trace where the Saxon work ended, and that of the Norman period began, as the masonry was all of similar character, and seemed properly bonded together. There were references in Saxon chronicles and early works to a monastic establishment in the village. Alphege, afterwards Archbishop of Canterbury, was known to have been a monk at Deerhurst in the year 960, but he had not been able to find traces of the buildings nor records of their destruction. Mr. Beresford Hope said the rood-loft doors were much like those at Kilpeck, but the structure appeared more ancient. He could not see any reason to doubt that it was really the work of Odo, as the inscription stated, because where there was no wholesale destruction of monuments, it was a mere question of wear and tear whether a solidly built church like this was 800, 900, or a thousand years old. He believed the original structure to have been Saxon in origin, but he agreed with Mr. Blashill that the porch and chancel arches were later than the main building.

The visitors then returned by boat to Tewkesbury, many of the members of the Institute leaving by train. Some, however, remained on board availing themselves of Sir Edmund Lechmere's invitation to spend the evening at the Rhydd, near Upton-on-Severn, the steamer taking them on to Worcester at a later hour.

THE EGYPTIAN OBELISK.

THE model obelisk on St. Stephen's-green, Westminster, is now completed. It was hurriedly built with boards, which have wide spaces between them, but at a little distance give the effect of a needle of Syenitic granite. The colour is not very good. It should be reddish grey. The dimensions of the model are those of the original. The precise height of the obelisk is 68ft., but the pedestal is 10ft. high, and is approached by steps, which raise the total height of the model to 81ft. The obelisk is 8ft. wide at the base measured one way, and 7ft. 3in. wide, measured the other. The ideal proportions of an obelisk are such that the height should be ten times the breadth; and thus the obelisk is not quite so tall as it should be. It is 180 tons in weight, and the site selected for the model is just above the Metropolitan District Railway. But according to Mr. Dixon, the engineer who has undertaken to place the monolith in position, this situation offers no obstacle to securing a good foundation upon an iron bed, which might be laid across the railway. The *Times* says it was by the express wish of Lord Beaconsfield that this model was erected. The site originally proposed for the obelisk was a green corner of the Thames Embankment, offered for the purpose, near the statue of Outram, but there it would be comparatively obscure. The back of the Horse Guards and the front of the British Museum were also proposed, but objections were urged. The present site was chosen for the model because so tall and heavy a single mass of sculptured Syenitic granite is a precious stone on the largest scale, and it seemed fitting to place it in a setting which is also of value. It is further necessary not to move too far from the river. The pedestal is built low enough to enable Egyptologists to read the hieroglyphs as they were read by the priests of On, the city of the Sun, 3,000 years ago, before the great stone was floated down the Nile to Alexandria, and there erected in the eighth year of Augustus beside its fellow, which still stands in Egypt. Both that and this are called Cleopatra's Needle. It was the wont of the Egyptians to erect these mysterious pillars in pairs, and thus there are two "Cleopatra's Needles," just as there are two "Pharaoh's Needles," the one now at St. John Lateran, and the other in the Atmeidan, in Constantinople. This English Cleopatra's Needle is more valuable than its Egyptian fellow, as it is 200 years older, and shows in its hieroglyphs two periods of Egyptian sculpture—the age of Thothmes III. and that of Rameses.

Building Intelligence.

BLACKBURN.—The new Roman Catholic Church of St. Joseph, Blackburn, is approaching completion. The style is Italian. The plan is a Latin cross with a total length of 144ft., and a total width of 70ft. A bell tower forms at once a porch to schools and church, and a belfry. The interior of the church, which possesses an enriched ceiling, is imposing, and affords a spacious and unobstructed area for the congregation. The apse is approached by a lofty arch, supported on sculptured consoles and Corinthian capitals, which surmount marble pilasters. The high altar is of elaborately sculptured wood-work, gilt and painted, inlaid in marble slabs. The tabernacle is enriched with enamel painting, representing the wheat and vine, and a brass crown and curtains surmount the whole. Behind the apse are convenient sacristies. To the right, in the transept, the organ tribune is reached by a separate staircase, which also serves the sacristies. The left-hand transept is to contain a lofty and elaborate altar of marble and alabaster. The works have been carried out under the direction of Messrs. Goldie and Child, architects, of Kensington, by Mr. Craven, builder, of Blackburn. The whole cost is something under £12,000.

DEAN BARRICKS CHARITY, WESTMORELAND.—Two new schools, in connection with this charity, were opened at Witherslack last week—one for boys and one for girls. The buildings are of stone, and the contracts have been carried out by local tradesmen, under the care of Mr. G. Rigg, the architect, of Kendal. The schools throughout are warmed and ventilated by Shillito and Shorland's Patent Manchester School Grates, which on testing were found to be extremely powerful.

GLENFIELD.—A new Wesleyan chapel has been opened at Glenfield, Leicester. It is in the Early English style, and is built of Groby slatestone, with Bath stone dressings externally, and Bath and red Alton stone dressings internally. It is in the form of a cross, and the nave is 36ft. long by 24ft. wide, the height of the roof being 20ft. The schoolroom, which adjoins, is 33ft. long by 15ft. wide. The chapel itself is seated to accommodate 250 people. The whole building has been erected by and from designs made by Mr. H. F. Allen, builder, Erskine-street, Leicester. The total cost is about £800.

LONDONDERRY.—On Friday last a new theatre was opened in this town. The general tone of the decoration is a light cream-coloured ground, upon which is painted Renaissance ornament in gold and colours. Mr. C. J. Phipps is the architect.

NEWCASTLE-ON-TYNE.—A new bank for the North Eastern Banking Company has been erected in Grey-street, Newcastle-on-Tyne. The bank is entered through a stone door of Classic design, the columns and architraves being of polished granite, the rest of the work being of polished Kenton stone. The size of the public-room is 70ft. long, 41ft. wide, and 38ft. high. It is designed with a dome to ceiling panelled, and with moulded and ornamental ribs, supported upon ornamental trusses. The sides of room are spaced out with Corinthian pilasters, with caps, moulded dado and bases, the spaces between pilasters being arched, and the whole filled in with moulded and ornamental work. This is entirely of Keen's cement, and was executed by Messrs. W. B. Wilkinson and Company. The general works have been carried out by Mr. L. Gaby, and the whole is from the designs of Mr. W. Lister Newcombe, architect, of Newcastle.—The Newcastle-upon-Tyne Improved Industrial Dwellings Company, which has proved a great success, have agreed to extend their existing block to about treble its present size. Since the foundation of the company, eight years ago, repeated attempts have been made to extend the buildings, but on receiving tenders it was found impossible to carry out the plans without advancing the rents, to which the directors have always objected, as tending to exclude the class of tenants for whom the buildings were principally designed. In consequence of the present depression of trade,

the company now find themselves in a position to proceed with their work in a more satisfactory manner. The proposed additions, which will cost upwards of £10,000, will embrace several improvements, sanitary and otherwise, calculated to promote the health and comfort of tenants. We may at another time give a detailed description of the building.

ST. MARK'S VICARAGE, NOTTINGHAM.—The corner stone of this building was laid on Tuesday last, by the Rev. W. Felton, in the presence of the committee and a few friends of the vicar. The building, towards which the Ecclesiastical Commissioners have made a grant, is being erected from designs prepared by Mr. S. Dutton Walker, of Albert-chambers, Nottingham, and is situate in a pleasant part of Maperley-road, at a distance of only a few minutes' walk from the church and parish.

WHIXOE, SUFFOLK.—The School Board have accepted the tender of Messrs. Mason and Son, builders, Haverhill, for the erection of the new schools and teachers' residence. The site selected is at Baythorne-end, and the works are to be commenced immediately. Mr. Frank Whitmore, of Chelmsford, is the architect. Mr. Whitmore has designed a great many schools in this neighbourhood, and they have given great satisfaction.

SCHOOLS OF ART.

BARNSTAPLE.—A new school of art is formed at Barnstaple, and will probably open on the 1st September. Mr. S. John Ireland, late headmaster of Barrow-in-Furness, is appointed to the mastership. It is also contemplated to open a school of art at Ilfracombe, for the benefit of residents in the winter, and of visitors in summer; but at present there seems a difficulty in obtaining premises of sufficient size to carry on the classes. It is expected that Mr. Ireland will also conduct this school. We shall be glad to hear that this latter is in working order, for then there will be some probability of visitors bringing away a few souvenirs of the delightful scenery of North Devon.

PUBLIC HEALTH.

The Leading Journal of Sanitary Science and Progress. Price Two-pence. The number published August 17 contains articles on The Manchester Exhibition of Sanitary Appliances, The Filtration of Water, The Air of Cities, Hospital Construction, Ventilation, Watering Places and Summer Resorts, The Compulsory Registration of Infectious Diseases, Visit of the Sanitary Institute to Leamington, Mr. Mechi on the Sewage Question, Public Health Reports, Parliamentary Notes, Legal Intelligence, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c. Price 2d. (Annual Subscription, post-free, Eleven Shillings). 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces. Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s. Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—C. S.—J. Robinson.—F. W. T. ARCHITECTURAL SCIENCE CLASS.—A. E. J. (writes to express his disappointment at the termination of the Science Class. In reply to his questions, we beg to say the class commenced in January, 1876. It is our intention to commence another series, as supplementary to the last.)

"BUILDING NEWS" DESIGNING CLUB.—Lcizlad. (We will make inquiries. Your suggestion shall be considered.)—James Hornley. (We intend to republish the rules for the benefit of several inquirers, in our next issue.)—Omega. (Shall be attended to.)

Correspondence.

HOW NON-SURVEYING ARCHITECTS "PROTECT" THEIR CLIENTS.

To the Editor of the BUILDING NEWS.

SIR,—Your contributor, referring to my letter of this day fortnight, asks if enormous overcharges caused by excessive quantities do not occur as often when an architect takes out his own quantities as when he leaves them to an independent surveyor. I think any one with much practical experience of contracts will agree with me when I say most decidedly not. The reason is clear. In nine cases out of ten the architect is exceedingly anxious to keep the cost down to the amount of his own estimate, and architects' estimates are very seldom too high. So strongly does this cause operate that, in justice to the contractor, the quantities should always in such cases be made the basis of the contract.

Your other correspondent may be assured that it is far from my intention to cast any slight upon either surveyors or builders generally, though in the particular case I named there are strong reasons to suspect that one of the surveyors was in collusion with the builder whose tender for the original works was the lowest. All I say is that, with an independent surveyor, tenders, in my experience, have always come in high. At all times and places this fact has recurred till it has forced itself upon me as a sort of primary law of nature. Why it is so is a different matter, which need not be discussed now. But the important point, which ought never to be lost sight of is this, that the architect who does not take out his own quantities is powerless to protect his client. His building is practically certain in any case to cost 5 or 10 per cent. more than it ought to cost, and how much more it may come to the facts given in my last letter will enable every one to judge. While the client is being victimised in this way the non-surveying architect stands helplessly by, and thanks Heaven that he is not as other men are, nor like these undignified architects who take out their own quantities.—I am, &c.,

CLAMANS IN DESERTO.

KENSINGTON VESTRY HALL.

SIR,—In reference to the notice which appeared in your journal the week before last, I beg to state that there is all the difference between my design and that of Mr. Walker that there is between (if I may venture to compare buildings, so infinitely superior to either), as the Farnese Palace and the Library of St. Mark's, the Reform Club and the Carlton. My reason for choosing the simpler style of design is explained in the letter I have addressed to the vestry, a copy of which I enclose.

With reference to the estimated cost of my design (based on the actual cost of a building now erecting by me in the immediate vicinity of the Vestry Hall), I beg to append the following ex-parte statement of a well-known firm of builders.—I am, &c., EDWD. C. ROBINS, Author of the design marked "Experience."

[Copy.]

7, St. George's-road, N.W., Aug. 10, 1877.

PROPOSED VESTRY HALL, KENSINGTON—MOTTO, "EXPERIENCE."

E. C. ROBINS, ESQ.

Dear Sir,—We have made a careful estimate of the cost of the above design, as now lying at the Vestry Hall, and we should have been prepared three months since to have entered into a contract to complete the same for £18,000. We should not object to take the works now for £20,000; but, as you are aware, the masons are on "strike," and we should not like to give you a definite estimate until the labour question is settled, when most probably it might be done for something less.—We are, &c.,

(Signed) MANLEY AND ROGERS.

[COPY OF LETTER ADDRESSED TO THE CLERK OF THE VESTRY OF KENSINGTON BY "EXPERIENCE."]

GEO. C. HARDING, ESQ.

MY DEAR SIR,—Since accepting your invitation to meet the committee on Tuesday, the 14th inst., I have seen a paragraph in the

BUILDING NEWS which surprises me. In the instructions to architects the vestry reserved to itself the selection of the premiated plans, after taking the advice of a "professional assessor," to be "appointed to advise as to whether the selected designs can be carried out for sums mentioned by the respective architects." And I think it would be gratifying to all the competitors if the report of the assessor were published. For myself I should be glad to learn his opinion as to the cost of the other three selected designs, some of which, it is said, were not included in his list of designs to be recommended to the vestry, and notably that selected for the first premium.

From inquiries made by me, before entering upon the competition, I was led to believe that the vestry had made up its mind to adopt the best plan, and avoid an expensive elevation. The tone of the instructions seemed to confirm this view, and therefore it was that I threw my strength into the development of the interior arrangements of my plans, and so far succeeded that there does not appear to be any great difference of opinion that the plans and sections presented by "Experience" were the best. This opinion was confirmed by the committee, which at its two first sittings acted upon this conviction and put my designs first by an overwhelming majority.

Judge of my surprise, therefore, when I read in the BUILDING NEWS that "Experientia" has been selected solely because the elevation given was by some considered to be the better, and that it was even proposed "to refer the matter to the committee, to consider what plan should go behind the elevation of 'Experientia.'"

Now, nothing is easier or more agreeable to an architect than to design a noble facade if it is desired, and when he puts a restraint upon his pencil to meet the expressed wishes of his clients, and with a view to economy where it will least interfere with efficiency, it ought not to count against him, and even deprive him of both the first and second places in the competition which he has fairly won by his plans.

Having been engaged in the full practice of my profession for upwards of twenty-five years, during which time I have won more competitions than fall to the lot of most architects, surely I may be trusted to design a facade sufficiently handsome to meet the new requirements of the vestry, and worthy "to go before" my own plans, and not those of another.—I am, my dear Sir, yours faithfully,

EDWD. C. ROBINS.

14, John-street, Adelphi, Aug. 6, 1877.

WAITING FOR A DETAIL.

SIR,—Under the above heading a correspondent asks in last week's issue of your valuable paper, "Who but a contractor is weak enough to sign a deed containing a clause to the effect that it (i.e., a detail) may be added afterwards? Every builder knows what it is to receive detail drawings when a job is half finished, perhaps not only showing more work than was anticipated, but requiring work already in hand to be altered."

Much, Sir, has been said about this, and also about the question of quantities, by correspondents whose knowledge of professional practice must be very limited—much that I believe would not have been written had their knowledge of this been more extensive. And, as an architect, I protest against the insinuation of unfairness contained in the above quotation, as though the architect knowingly defrauded the builder by detail drawings supplied after the signing of the contract, showing more work than was "anticipated" (?)

Anticipated by whom? I would ask. Surely not by the builder. With a carefully prepared copy of quantities before him, what need, nay what right, has he to anticipate anything, certainly so far as the "work" is concerned? The preparation of an estimate from a carefully prepared bill of quantities is not a work of anticipation, but is one of certainty.

The suggestion desired by your correspondent of "some plan to improve the present state of things" is very easy to give. It is, first, that the architect take out his own quantities.

Knowing what work he requires to have done he knows best how explicitly to describe

it in the quantities; and afterwards, when he prepares the detail, he knows exactly how he had described that particular work in the quantities supplied; and, secondly and mainly, to make the quantities the basis of the contract. This I think I may say is always—certainly almost always—done in Manchester; and, indeed, out of London I am of opinion that this is mostly done. That it is the only equitable mode, wherever quantities are supplied, to make them the basis of the contract, there can be no doubt. We do so in Manchester, and thus when we prepare our details we know that, if those details contain any work whatever over and above that given in the quantities, the builder must be paid for it as an "extra;" and that, if our moulded work, say our cornice, was given in the quantities as 12in. girth, and our detail of cornice girths 3ft., the builder is clearly entitled to the additional 2ft., and we also know that he will not forget to claim it.

The closing suggestion of your correspondent, "Consider the End," is, nevertheless, a good one. At the same time I would invite him also to

CONSIDER THE BEGINNING.

Intercommunication.

QUESTIONS.

[5087.]—Durability of Timber.—Will some reader inform me whether timber, left rough from the saw, is more durable than when it has been planed up, and if so, the reason of it?—L. G. S.

[5088.]—Cement Floor.—In a house recently built, the basement floor is laid in cement, on a bedding of broken stones 6in. to 9in. thick, beneath which field tile drains are introduced to carry off any surface water; notwithstanding, the floors are continually moist. Could any readers of "Intercommunication" kindly give the reason and cure for above?—FIELD RYE.

[5089.]—Roll Wrought-Iron Girders.—Will some kind friend inform me what size girders I shall require? I am about building a pair of houses, with a passage between 3ft. 6in. wide, leading to back. At first-floor I want to build the 9in. party-wall, with double chimneys over centre of passage, to make the bed-rooms equal size. I want to put short girders bearing on passage walls, then girders from front wall to back, resting on short girders, to carry 9in. wall. I intend turning arches over passage to carry chimneys. The wall will be 35ft. long, by 20ft. high.—IGNOR.

[5090.]—Bamboo Furniture.—How can I stain bamboo cane, such as is made up into Indian furniture? Must one remove the flinty surface; and, if so, can it be done with any acid, and what?—F. C. P. F.

[5091.]—Window Tracery.—Will any reader kindly inform me which is the best method for measuring and drawing out the tracery of windows?—ALPHA.

REPLIES.

[5073.]—Wall Decorations in Distemper.—"Kappa" and J. A. Howick, are recommended to visit the offices in Cannon-street, of the Liverpool Silica Paint Company, whose advertisement will be found in current BUILDING NEWS. This company's distemper has the pureness of tint and absence of glaze so valuable in distemper colouring, with the great advantage of being, like oil paint, durable. It is capable of being washed frequently and acts on a damp wall as waterproofing. It will, I believe, prove the desideratum longed for by artists for pictures, all other mediums having failed for mural purposes. I should fancy in time it must supersede ordinary distemper and oil paint. I beg to say I have no connection with the company. Let "Kappa" and others examine for themselves.—M.

[5074.]—Cleaning Plaster Casts.—Simple plaster cannot be well cleaned. The best way to treat casts would be to saturate them with size and give them a coat of oil paint. For the mending, soak the parts well in the size, and when dry unite with glue. The effect of the sizing is to harden the surface and prevent absorption.—M.

[5078.]—Colouring Lithographs.—With a broad flat camel hair brush spread a thin solution of size over engraving. One application will probably be sufficient. A pennyworth of size can be obtained at any oilman's, and will go a great way. It is simply the application of size which makes the difference in paper manufacture, whether it absorbs or not. Insignificance will also do for the purpose.—M.

[5079.]—Church Roof.—The pitch pine boardings you name would make a very good covering. Try Engert and Rolfe's felting, Poplar, London, E. It is about 1d. per square foot.—G.

[5082.]—Warming Rooms with Hot Air.—"S. Y. D." would do well to avoid fitting his room, heated with dry hot air, in the manner he describes. See Dr. Ure's paper in a late number of *Loudoun's*

Architectural Magazine. The air would be much too dry, burnt, and sulphurous to be healthy. Hearn and Co., Liverpool, fitted for me two top rooms, heated by lin. hot-water pipes, the source of heat being the open grate in the parlour. The ordinary fire-bars were removed, and instead was placed a circuit of wrought-iron piping, shaped like the bars, which, passing up the chimney, goes into the top rooms, and round the skirting, and from this I got 60° to 70°. The pipe forming the bars of the grate—indeed, the whole pipe—is filled with water, and as it becomes heated, the water forces itself upwards and along the piping, back to the fire again. No boiler is needed, only half-pint of water once in three months or so.—E. J. ARCHER.

[5082.]—Party Wall.—I should say that the party wall agreed to be built by B., 6ft. high, would be understood as measured from the original level, and not from the sunken level A. has reduced his ground to. He has evidently done this at his own risk, and for his own convenience, and should certainly pay for the additional footing of wall required.—G. H.

[5082.]—Party Wall.—From "B.'s" level, making "A." pay for any backwork beneath it.—J. HATTON LOWE.

[5082.]—Party Wall.—6ft. high would be interpreted to mean 6ft. high from the natural level of the land, as it was at the time of making the covenant, unless the deed provided for an alteration of that level.—L.

[5083.]—Board Schools.—A fair average may be taken at from £7 to £10 per head. For a plain building the first sum would be a fair rate, although some of the Board schools have cost as much as £13, and even more. If space is no object I should certainly prefer the buildings to be one story, but, economically considered, a two-storied building is best.—G. H.

[5084.]—Quantities, &c.—The spars and joists of roofs and ceilings, along with timber, labour, and nails, are measured superficially. Wall-plates, bond-timbers, purlins, ridges, &c., are given lineally.—J. HATTON LOWE.

[5084.]—Quantities for Joiner and Carpenter.—The proper and customary method is to take the measurement of floors and roofs as follows:—Take the timbers in joists, principals, &c., as cube, "fixed" or "framed," only according to labour; and in measuring the timbers take the full quantity used, including all tenons and bevelled ends. The 11th clause referred to means that the nett length only of the timbers is to be taken. The measurements are generally taken in superficial feet, not yards. In the Manchester method the labour and nails are measured superficially by the yard, and the joists or timbers taken lineally.—G. H.

[5085.]—Plumbers' Quantities.—Take the quantities of piping for the building only; the gas or water company usually bring it to the house.—G. H.

CHIPS.

The interior of St. Nicholas Church, Worcester, is being renovated and decorated in colour by Mr. F. Wells, of that city. Gilding will be freely applied, the ground tones being French grey and white.

The next Congress of the Bristol and Gloucestershire Archaeological Society will be held at Cirencester, under the presidency of Earl Bathurst, on August 28th, 29th, and 30th. It is intended to visit Calmsden Wayside Cross; Chedworth Church and Roman Villa; Stowell Church and Manor House; Fairford Church, with its figured windows; Amney Crucis; Quenington and Bibury.

A new drinking fountain is about to be erected at the northern end of the eastern Royal Exchange-avenue. In the design adopted the lower part of the fountain is of Penryn granite of different tints, and polished. The contract for this will be entrusted to Messrs. Freeman. Upon this base, supported by coupled columns at each angle, is an ornamental canopy to protect a group of sculpture; this will be wholly of bronze, picked out with gilding. (This part of the design will be entrusted to Messrs. Hart, Son, Peard, and Co.) The architect is Mr. W. S. Edmeston, Great Winchester-street.

The foundation stone of a new church at Lane End, near Great Marlow, has been laid. The church, which will have sitting accommodation for 300 persons, has been designed by Mr. J. O. Scott, the contractors being Messrs. Silver and Son, of Maidenhead. It will consist of nave, chancel with aisle for children, and a low tower. The style will be Early Decorated, and the cost £2,845.

A new painted window has just been placed at the east end of Barton Stacey Church. The window, which has been manufactured by Messrs. Ward and Hughes, of Soho, represents the Crucifixion, with smaller representations underneath of the offering up of Isaac, the Paschal Lamb, and the serpent in the wilderness.

A new church at Sunk Island was consecrated on Wednesday week at a cost, with the parsonage, of about £6,000. The style is Early English, and the building is of red brick with stone bands and dressings. Mr. Ewan Christian is the architect.

Our Office Table.

THE Rev. Charles Boutell, a well-known antiquarian, has died at his residence in Portsdown-road, Maida-hill, at the age of 67. Mr. Boutell graduated at Cambridge, but was subsequently incorporated at Trinity College, Oxford. Having been ordained, he held curacies in Norfolk and Herefordshire, and afterwards became Vicar of Downham Market and of another living in the former county. He was well known by his works on "Heraldry," "Ancient Monuments and Recumbent Effigies," and on "Ancient Arms and Armour." He was a member of several antiquarian and archaeological societies. He was at various times during the past quarter of a century a contributor to this journal, and was at all times ready to aid in giving or obtaining information relative to architectural and archaeological matters.

ON Saturday, Mr. James Abernethy, Vice-President of the Institution of Civil Engineers, distributed to the successful students of the Crystal Palace School of Practical Engineering the certificates that had been awarded by the examiners, Mr. Henry Law, M. Inst. C.E., and Mr. William Dempsey, M. Inst. C.E., for the term that has just closed. The principal awards were:—Railway and dock work—1. F. J. Scott; 2. C. H. Clarke. Drawing office—1. F. J. Scott; equal 2. C. H. Clarke, E. Hott, P. H. Naftel. Pattern shop—1. T. E. Fuller; 2. C. W. Carrington. Fitting shop—equal 1. G. F. Hardy, W. S. H. Hutton; 2. A. Pine. Civil Engineering Section—Parliamentary Work, &c.—equal 1. G. S. Firth, L. W. Toms; 2. H. H. Lake. Working plans for a railway and dock—1. S. R. Lowcock; 2. C. W. James. Mr. Howard Newton and six others received certificates in the Colonial Section.

We have just received copies of the latest editions of Mr. B. T. Batsford's catalogue of architectural and engineering new and second-hand books, to which we direct the attention of the many readers who are so constantly asking us to recommend books. Mr. Batsford's long experience and acquaintance with the literature of the two professions is always at the service of inquirers, and it must be a book of very little value or unparalleled rarity that cannot be procured at his shop. We notice he offers for sale a complete set of this journal from 1857 (the commencement of the illustrated series) to 1874, at a price which is very moderate considering its scarceness. When it is remembered that the set of volumes contains over two thousand illustrations, embracing the "Art Foliage" series, the BUILDING NEWS Sketch-Book, and other valuable and interesting plates, it will be admitted that Mr. Batsford is not indulging in any exaggeration when he describes a set of our volumes as "an architectural library in itself."

The new Catholic Apostolic church, at Summerhill, Birmingham, has just been enriched by the addition of a very handsome pulpit, the gift of a lady, who unfortunately died before the work was erected in its place. The design, by Mr. J. A. Chatwin, is circular on plan, wrought in Caen stone, alabaster, and Irish marbles, and was executed at the establishment of Mr. John Roddis, Birmingham.

The foundation stone of a new Wesleyan chapel was laid at Horfield, Bristol, on Monday. The building is in part an enlargement of a former structure. The designs have been prepared by Mr. H. Williams, and Mr. Price is the builder. The cost has been estimated at £800.

We are pleased to observe that a certificate of merit was awarded to Shillito and Shorland for their patent Manchester Grate and School Grate, at the exhibition of sanitary appliances, in connection with the British Medical Association, held at Owen's College, Manchester, last week.

The Manchester School Grates are fitted up throughout in the class and lecture-rooms of the new Roman Catholic College of St. Francis Xavier, Liverpool, now being completed from the designs of Mr. H. Clutton.

The Primitive Methodist church, at Hessele, was reopened on Sunday, August 12th, after being thoroughly restored and enlarged at a cost of £831 10s., from the designs and under the superintendence of Mr. R. Poits De Redder, M.A.A., architect, of South Shields.

LEGAL INTELLIGENCE.

CHURCH BUILDING CONTRACT—Covenant by Vicar to pay, whether building personally or as Trustee—Chancery Division—Williams v. Hathaway—Before the Master of the Rolls.—By an agreement made between the plaintiff, a builder, of the one part, and the Rev. W. W. Champneys, Vicar of St. Pancras, and the Rev. C. H. Andrews, incumbent of St. Luke's district, of the other part, after reciting that under the St. Luke's (King's-cross) District Act, 1868, said Champneys and Andrews, as such vicar and incumbent respectively, held a fund for building a church, to be called St. Luke's Church, for a new district within the parish of St. Pancras: It was witnessed that, "in consideration of £9,391 to be paid by said Champneys and Andrews, their executors or administrators, or the person or persons for the time being entitled to apply the said fund under the said Act, to the plaintiff in manner thereafter specified," he, the plaintiff, agreed with said Champneys and Andrews, "and said Champneys and Andrews to the intent (so far as they lawfully could or might) to bind such person or persons as aforesaid, but not so as to bind either of themselves, or his heirs, executors, or administrators, after he or they should have ceased to be entitled to apply the same fund, did, and each of them did, thereby agree with the plaintiff," then followed provisions for building the church. By another agreement of the same date, and made between the same parties, an agreement containing a similar covenant was entered into for the building of a parsonage-house with the balance of the fund. In November, 1868, before the completion of the church and parsonage, Champneys ceased to be Vicar of St. Pancras, and by that time the whole of the building fund had been expended on the building in question, but a sum of £1,585 remained due to the plaintiff for "extras." In February, 1875, Champneys died, whereupon the plaintiff brought this action against his executors to recover the £1,585, insisting that Champneys' covenants in the agreements were personal covenants, and as such binding on his representatives. An action for the same amount was also pending in the Common Pleas Division against Andrews. The Master of the Rolls held that the covenant was enforceable against Champneys only so long as he was Vicar of St. Pancras—that is, so long as he was a trustee of the fund; and that in any event the covenant merely bound the fund. Action dismissed with costs.

CHIPS.

At a recent meeting of the Christchurch (New Zealand) Philosophical Institution, President Haast gave an account of the discovery of remarkable ancient rock paintings in the Weka Pass Ranges. He exhibited careful drawings of them. Some of them are 15ft. long; they represent animals of foreign countries, weapons, and dresses of semi-civilised people; underneath are characters like those of the Tamil language, and those on the ancient hill found in the North Island.

Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

Trade News.

WAGES MOVEMENT.

LONDON.—The Central Association of Master Builders have issued an explanation of their course of action with regard to the dispute now pending between themselves and the London masons. It appears, according to their statement, in January last a demand was made by the masons for 1d. per hour increase of wages, and the shortening the hours of labour by two-and-a-half per week, to commence from the 30th of July. After some correspondence the masters refused the increase in wages, but were willing to meet the masons by opening their works during the summer months half an hour later in the morning, provided the men would work half an hour later in the evening; but as this would necessitate the works being kept open for one trade only, the masters could only concede this point upon the conditions that the masons themselves obtain the consent of the other trades affected to work the same hours. At a conference of the masters' sub-committee and the masons' delegates on the 26th ult., of several hours' duration, the men did not, in the opinion of the masters, adduce any sufficient reason to warrant an increase in wages. The delegates declining to fall in with the masters' suggestion to meet the difficulty of working hours as conveyed in their resolution, the masons have since endeavoured to enforce their demand by striking; they having left all the London works on the 28th of July last. It has been reported that 55 firms have conceded the increase in the rate of wages, but the masters now state that there are only two firms, employing a very small number of masons, who, for special reasons, have given the increase under protest. At the meeting last week the masters' committee saw no reason to depart from their resolution. On behalf of the men, Mr. Henry Nisbet, the secretary of the London lodges' committee of the Operative Stonemasons' Society, writes, contradicting the masters' statements. He admits in the present accuracy of the report that 55 firms have conceded the increase in the rate of wages, but he says that report was correct when made, and others must now be added, as there are now 90 firms who have conceded the increase of wages. He declares if the members of the Masters' Association were to walk the length of the street in which their office is situated, they would find at least two firms paying the advance—one of them employing about 100 masons. The list of firms now paying the advance, he repeats, numbers 90, the correctness of which he is prepared to prove to the satisfaction of any one, under certain conditions.

MANCHESTER.—On Thursday week 34 carpenters arrived from New York at Manchester. They have accepted work with Messrs. Neill and Sons. A good many of them are Englishmen, returning to the old country. Several more are expected to follow. On the part of the men it is said that up to the present time upwards of £4,000 has been contributed from outside sources towards the support of the joiners who are out on strike in this city; and that the number of men in receipt of strike allowances has been reduced during the past week from 810 to 723.

TERMINATION OF THE MASONS' STRIKE AT CARDIFF.—This strike, which has lasted nearly four months, was brought to a close on Saturday. A large meeting of operative masons was held at the Swiss Hall, on Saturday afternoon, to consider a communication from the Master Builders' Association, expressing the willingness of the masters to try for a period the Conciliation Board, as proposed by the men. The masters have for some time been willing to adopt the Conciliation Board, but in the event of the board not coming to an agreement, the board to appoint an umpire. To this latter point the men objected. They required that the points in dispute should be again referred to the general body for further consideration. The masters have now yielded this point, and the men passed a unanimous resolution to resume work on Monday morning.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's purifying, cooling, and strengthening Pills are admirably adapted for all irregularities of the human body, and should be at once resorted to when the stomach is disordered, the liver deranged, the kidneys inactive, the bowels torpid, or the brain clouded; all these and greater inconveniences will yield to this medicine.

TENDERS.

BASFORD.—For the erection of two houses with sale shops for Mr. W. H. Hutchison. Mr. S. Dutton Walker, F.S.A., and Mr. Herbert Walker, C.E., joint architects; quantities supplied:—

Hodson and Facon	£1,025 0 0
Bell and Son	975 16 0
McCulloch	941 12 0
Woodcock and Clayson	913 19 5
Clarke	895 0 0
Wooll	880 0 0
Hopewell	853 2 0
Doughty	839 8 0
Wade	830 0 0
Baines and Trpton	825 0 0
Stainforth (accepted)	765 0 0
Newham	760 2 8
Herriott	750 0 0
Dickens and Brown	548 5 11

BULWELL.—For paving Herbing-street, in Bulwell Market-place, for the Local Board. Mr. Herbert Walker, engineer; quantities supplied:—

Cordon	£696 0 0
Messon	593 0 0
Redgate	551 3 2
Stainforth	525 0 0
Meats Bros.	521 10 3
Attenborough	467 18 8
Parker	434 7 6
Knight (accepted)	337 5 0

ESSEX.—For additions to 13, Manor-villas, Theydon Bois. Mr. William Eve, architect:—

Heiser	£478
Clarke (accepted)	357

HACKNEY.—For works in forming new roads, &c., at Hackney. Messrs. Lee and Smith, surveyors:—

Castle	£495
Waldram and Co.	449
Forrest	379

LONDON.—For alterations and fittings at 52, Thread-needle-street. Mr. William Eve, architect:—

Lawrence and Sons (accepted)	£492
------------------------------	------

LONDON.—For the erection of stabling and warehouse at Stoke Newington. Mr. William Eve, architect:—

Heiser	£1,160 0 0
Devereux	1,109 0 0
Salt	994 16 0
Sheffield	968 0 0
Crabbe (accepted)	950 0 0

LONDON.—For stabling, &c., at Amhurst Park-road. Mr. William Eve, architect:—

Crabb	£350
Salt	245
Heiser	244
High (accepted)	232

LONDON.—For rebuilding No. 2, Pancras-lane, for Mr. Champion. Quantities by Messrs. Batterbury and Huxley:—

Greenwood	£2,260
Newman and Mann	2,135
Ashby and Horner	2,113
Ashby Bros.	2,078

STEPNEY UNION.—For painting the exterior of the workhouse and infirmary, at Bromley-by-Bow, and for sundry repairs and exterior painting, at the offices, York-street, Commercial-road, E., for the Guardians of the Stepney Union. Messrs. A. and C. Harston, 15, Leadenhall-street, architects:—

Fowler, Stratford	£599
Balding, Belvedere	466
Wortley, Finsbury Park	345
Whitford, Stepney	327
Anderson, Stepney	311
Haynes, Bromley, E.	297
French and Maloney, Mile End	285
Derby, Limehouse (accepted)	279

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 24, 1877.

THE PRINCIPLES OF RENAISSANCE ARCHITECTURE.

THERE is, as we have lately had occasion to remark, a decided indication of a return to the Renaissance, not only of this country but of France. The tendency towards this taste is at least a healthful one, as it shows that our modern architects, in obedience to the wants of the age, are casting about for elements and forms that have some affinity with the requirements and social habits of their day. Gothic types have been pretty freely used. We have seen several admirable efforts to adapt the style to public and domestic buildings. It must be admitted also there have been some absurd blunders. The public at last seem to have expressed their discontent at the result, and while it has been generally agreed that the style is admirably suited for ecclesiastical purposes, and even for situations demanding a variety in the external features, it is acknowledged that the requirements of modern buildings in our large towns, and the use of square-shaped openings, favour the employment of a style that verges more on the lintel than the arch arrangement. There is no doubt the Queen Anne presented to the architects influenced by it one of the nearest approaches to the taste dictated by the domestic programme of modern life; it was besides a facile style readily adapting itself to brick, to the venacular sash window, and to furniture and decoration. This flexibility also, it must be observed, helped to bring the style into favour with those who had "cut their teeth" upon Gothic, and who had been brought up in total ignorance of Classic principles of design. The leaders of the Queen Anne, we need scarcely remark, were at one time Gothicists, and denounced Classic in unmeasured terms, not from a critical knowledge of its principles, but from a complete ignorance of them. Singularly enough these very men are now studying Greek and Roman detail, sticking on pediments and pilasters to their façades, and docilely falling back upon that formula they so much detested and assailed—the "Five Orders." We do not despair of seeing even Batty Langley extolled and made again to do service. Such must be the inevitable eventuality of a system of architecture that has no method, that is governed by a capricious taste, is bolstered up by a few leaders or a clique, in spite of intelligent criticism, that portion of public opinion which represents the advanced taste of the age, in opposition to the views and demands of scientific improvement. This clique sets up its own claim as representative much in the same way as a few religious dogmatists assert their pretensions in defiance of modern theological belief. Men of large views in art as in religion are regarded by such cliques as latitudinarians, wanting in all the attributes of genius and enthusiasm; and this is the invariable retort they receive. Unfortunately for the art sectarian, however, he is always a stumbling block, but is at last compelled to move and retract his opinions, by the force of that overwhelming law of change which he endeavours to resist. The ultra-Gothicists, the sticklers for one phase, and the adherents of dogmas, equally mistake in taking a form for a principle, and in pertinaciously fighting for it. The foolish idea of being made a martyr is, in the eyes of such enthusiasts, a virtue.

As affording one illustration of our remarks, we may refer to the principle of

symmetry in buildings. Viollet-le-Duc distinguishes the two modes of applying symmetry, adopted especially by the ancients and the architects of the middle ages. The Greeks we know admired the principle, but it should be remarked that although they made each building conform to its rules, they did not apply the symmetry of form to an agglomeration of buildings destined for distinct uses. They adopted a central axis to their temples, both sides of which were uniform, but in their houses they did not subject practical considerations to the same law—that is to say, the several parts were diverse in size, form, and position. The Romans, too, followed this wise rule of making each function, or part of a building independent of a general uniformity, though each part may have been symmetrical. Thus the Palatine at Rome was composed of several distinct parts not comprehended under a mask of symmetrical design, and ancient Roman buildings of which we have knowledge were always planned on the principle of giving to each office its special form, height, roofing, and importance in the structure. Though the Greeks and Romans both regarded symmetry in the parts, they did not make it a rule with the mass. It will be more correct, we think, to call the symmetry of the Greek temple an axial symmetry—that of the Roman palace displaying a symmetry of the integral parts. The former is really a correspondence of halves—the latter uniformity in the detail. We may remark *en passant* that one writer on architectural design rather forcibly combats the idea of the symmetry observable in animals which have no uniformity of internal parts, and yet have a correspondence of halves—an argument which, if it is worth anything, refutes the above doctrine. While we fully admit that this quality is one of the highest in design, and is as much a mental as a visible beauty, we cannot accept the doctrine that a building, with a public hall on one side, and a set of offices or domestic apartments on the other, should have a symmetrical outer casing. At any rate it is certain that perfect symmetry of *ensemble* did not exist to the extent believed among the Romans, and that symmetry of detail or parts was rather an accommodation to the programme. Be it observed, however, this liberty was a very different thing to creating diversity and irregularity for the sake of picturesqueness—a fault reserved to the school of Gothicists, who have adopted a form rather than a principle of action.

M. le Duc complains of the manner in which the Academic routine of French architecture adheres to the formal symmetry. We may also say the same of many of our English followers, who adopt the other fault of diversity and accidental shapelessness. The *Therma* of Caracalla or Diocletian, the *Basilica Ulpiana*, and other buildings show us, too, how the Romans expressed their internal treatment. A vaulted or ceiled apartment was evident from the very design and plan—each had its own treatment. The stone vault and the timber roof were each the outgrowth of the structure which supported it. Again, we find the same relation in the middle ages—the ground plan determined the whole. There is nothing redundant, and from the foundations upwards the architect had a clear methodical conception. The growth of the Renaissance, as depicted by Viollet-le-Duc, was a wonderfully different thing from the copying of classical forms and façades of the present day. From the time the Dukes of Orleans patronised the new school in the beginning of the fifteenth century, throughout the whole period of the Renaissance, architecture

continued to be the outgrowth of the day. Thus, the *Château de Madrid*, designed for Francis I., appears to be a compromise between the Gothic and traditions of the middle ages and the wants of a Court that had broken away from the past. There is a semi-Gothic arrangement of the pavilions and features. Though M. le Comte Laborde attributes the design to Della Robbia, the well-known designer of *faience*, he yet acknowledges the master-mason, Pierre Gadier, though as a subordinate artist or workman. As Viollet-le-Duc says, the term "master-mason" was applied to architects down to a late date, and there is reason to believe Della Robbia merely assisted Gadier, and modelled the decorative sculpture. Even De Laborde himself confesses the important share in the design Pierre Gadier had; how he broke up the front of this *château*, 250ft. long, into three blocks by stair pavilions, which give points of rest to the eye, and thereby enhance the value of the intermediate arcades. These turrets were suggested by those of the baronial castle. It is certain, however, Italian models had little influence on the design of this building, and Le Duc challenges comparison with any Italian palace. The *Château de Madrid* was continued by De l'Orme, who employed Pierre Courtois, of Limoges, to finish the *faience* work. As a model of a primitive structure this *château* stands unrivalled. The central hall, with *dais* at one end, the apartments with their separate *boudoirs*, the five pavilion stair turrets, square externally and circular inside, rising from the lower story, and connecting the suites of rooms on each floor, and also the arcaded terraces or balconies, which form so unique a feature, present us with an arrangement perfect for the age in which the traditions of the feudal residence or castle still lingered. As a plan of a seigneurial *maison*, the design is justly pronounced perfect. The programme of the day was observed in (1st) a well-considered aspect, so that each side might get the sun's rays; (2nd) in the apartments being grouped round a centre hall; (3rd) in facility for communication and service; (4th) intercommunication and independence of apartments; (5th) great depth of building, with the coolness in summer and warmth in winter hence resulting; (6th) balconies so as to shelter the windows; (7th) a well-lighted and vaulted basement. Such was a *château* adapted to the brilliant and select gatherings of Francis I. While privacy was maintained each guest could retire at his ease; the outer porticoes gave a quiet promenade, that on the coolest or warmest side being selected as preferred, with ready access unobserved to the private apartments of every floor, as the stairs were accessible from the balconies. In the planning of the great and inner halls we find means provided of entering the latter without crossing the great hall; behind the great open fireplace in the inner hall is a passage to allow of persons passing without interfering with those in front of the fire, and other ingenious arrangements to meet the special wants of the day are observed.

Of a far more pretentious character was the *Château de Chambord*. Here we have a quadrangular plan, with a central court and circular angle towers. The hall is cruciform; in the centre is a flight of double winding stairs, giving access to each floor, and this hall and its surrounding apartments form a distinct square block within the quadrangular area of the outer buildings. *Château de la Muette* is another example of a quiet retreat, planned for Francis I.—a kind of hunting-box. Here, again, the plan conformed to the programme required. In this plan, which

is singularly original in conception, there is a hall with windows on three sides, two balconies, two fireplaces, two entrances into large angle apartments, forming pavilion-like masses, and also an entrance into a chapel. Two other apartments corresponded to the hall on the other side of a central axis, which also had the same angle rooms, and communications between these are by the great hall or exteriorly, by means of spiral stairs, one of which is placed at each angle. Thus on each floor there are two suites of apartments, consisting each of the common hall and three bed-chambers, with wardrobes and closets. This château consisted of five stories with two entresols; it was chiefly built of brick, and the centre portion consisted of buttresses and arches. Another plan illustrating the Classical influence, and in which the Academic plan is apparent, is De l'Orme's projected design for the Palais des Tuileries for Catherine de Medicis. Only a fragment of this vast palace was erected by Philibert de l'Orme, and his design has been so transformed that few traces exist. As Viollet-le-Duc says, "the plan resembles more an Asiatic palace than a French château—at least, the plan as left by Du Cerceau." The elevation of the portion erected on the garden side by De l'Orme is admirably proportioned, and displays the refinement of the author. As Le Duc observes of the garden portico of the Tuileries, there are "few novel ideas, even old ones, but a special character and a subtle and delicate reasoning." There is, at least, the stamp of the French artist, Classical though it be. The Ionic columns consisted of a fluted stone drum separated by thin bands of marble delicately chiselled.

Another illustration from Du Cerceau's collection, published in 1615, shows a Manor House, consisting of a great hall commanding the prospect, lighted on four sides, attached to four suites of apartments on the ground-floor, and two flights of stairs to another floor of the same kind. This Manor House is of the end of the sixteenth century, and is surrounded by a moat with trellised walk, parapets, and bastions. Each block is roofed separately with high pavilion roofs—a custom which gradually disappeared before the grandiose notion of including all the apartments under one uniform eave and roof. The Château de Chantilly is illustrated to mark a feature of some interest and value—viz., the plan of forming two stories in a composition of one order. This was, indeed, the last struggle against the adoption of the system of superposed orders, which ultimately prevailed. The Château de Charleval is a remarkable instance of the architect's endeavour to avoid the double order, and to employ what is called the "colossal order," certainly not a very logical or artistic treatment. It at least gave an appearance of external grandeur, and when confined to large buildings, as it was at first, it did not lack consistency; but towards the middle of the seventeenth century it became general. Louis XIV. seems to have greatly admired the single order as indicative of grandeur. From the ascendancy of the "colossal order," architecture gradually lost its independent principles, though even towards the end of Louis XIV.'s reign it "ended with dignity," and even down to the close of the last century Viollet-le-Duc declares buildings were designed and executed with something of the sound traditions of art. "No one can enter a saloon of Louis XV. without finding himself transported into the midst of the society of that epoch." In short, it is shown that the Renaissance was virtually a following of the traditions of Gothic art, in which the structure and the decoration were never entirely separated—the body and the dress are one and the same thing.

DATA USEFUL IN CONSTRUCTION.

WE lately reviewed a portion of Mr. D. Kinnear Clark's "Comprehensive Manual of Rules and Tables," recommending the work to all those engaged in the arts of construction as the most complete treatise of the kind published. We now select at random a few figures and data that are of almost daily requirement in building operations. So full and comprehensive are the tables of weights and measures that no one need be at a loss in finding anything within the scope of those terms. Concerning water we have various useful standards. Thus it may not be known by every one that at the standard temperature of 62° the weight of 1 cubic foot of pure water equals 62.355lb.; the coincidence of the figures may be useful to the memory. Where great accuracy is not required the hydraulician or constructor may take the weight at 62½lb. equal to 1.000°. Again, the weight of a gallon of water at the standard temperature is 10lb., and by a lately-repealed Act of Parliament the volume of one gallon was put at 277.274 cubic inches; 1 cubic foot of water equals 6.2355 gallons, or 6¼ gallons for practical purposes. It may be usefully borne in mind by the practitioner that the capacity of 1 gallon is equal to 1 square foot, nearly 2in. deep, or to 1 circular foot, 2½in. deep nearly; a given volume of water in cubic inches may be converted into gallons by multiplying it by .00036, and that a ton of water contains 224 gallons, and is equal to 35.90 cubic feet. Referring to the pressure of water, it is necessary to bear in mind that a column of water 2.3093ft. high exerts a pressure of 1lb. per square inch, and a pressure of one atmosphere, or 14.7lb., is exerted by a column of water 33.947ft. high, or 10.347 metres. Every foot of water in height presses on its base with a force of 0.433lb; this is an important fact to remember in designing embankments, quay walls, and other tidal works, as well as tanks, reservoirs, and cisterns; as the lateral pressure of water at any depth below the surface equals the weight of a corresponding column.

Many are probably doubtful as to the origin of our common measures. The grain of corn constitutes the basis of our lineal measures. Three grains of barleycorn, placed end to end, made an inch; the ell (ulna) was derived from the length of Henry I.'s arm, and answers to one yard, though the standard yard, as most of our readers know, is a square bar of gun-metal marked with holes 36in. from centres, regulated by a pendulum 39.1393in. long, vibrating seconds in a vacuum in the latitude of London. The various wire gauges are given, including the Birmingham, Lancashire, Sir Joseph Whitworth's, &c. Decimal equivalents of inches and fractional parts are exceedingly useful. We find little respecting builders' measurements, but the French metric standards are amply detailed. These standards are the metre, and the kilogramme, the metre being the common basis. It may be interesting to know that the French metric system has been adopted by the following States: Belgium, in 1801; Holland, in 1819; Greece, in 1836; Italy and Spain, in 1859; Portugal, in 1868; the German Empire, in 1872; Columbia, Venezuela, in 1872; Ecuador, Brazil, Peru, and Chili, 1860; the Argentine Confederation and Uruguay. Great Britain adopted it so far as to render contracts in the French system permissive; so also the United States in 1866 legalised it concurrently with the old system. Other countries have adopted decimal measures, and Russia awaits the example of countries with which her commercial relations are most intimate, especially England.

An approximate rule for converting metres into yards is to add 1.11th. For

converting them into inches multiply by 40. For practical purposes a metre may be taken as equal to 3ft. 3¼in. = 40in. nearly, being 1.64th part less. The measures adopted throughout British India are so important that we give them:—

3 Jow	1 Jow or jaub	= ¼in.
4 Ungulees	1 Ungulee	= ¼in.
3 Moots	1 Moot	= 3in.
2 Big'haths	1 Big'hath or span	= 9in.
2 Hath	1 Hath or cubit	= 18in.
2 Guz	1 Guz	= 1 yard.
1,000 Dandas	1 Danda or fathom	= 2 yards.
	1 Coss	= 2,000 yards, or 1,136¼ mile.
4 Coss	1 Yojan	= 4,545 miles.

The Government surveys adopt the following land measures:—

3 Guz	1 Guz	= 33 lineal inches.
9 Square guz	1 Baus or rod	= 8½ lineal feet.
400 Square rods	1 Square rod	= 68½ square feet.
	1 Beezah	= 3,025 square yards, or 625 acres.

At Madras the English foot and yard are used, and at Ceylon the weights and measures are all English.

An approximate rule for the strength of cast iron flanged beams is the following:— "To the sectional area of the lower flange add a fourth of the sectional area of the web, calculated on the total depth, both in inches; multiply the sum by the total depth in inches and by 2½, and divide product by the span in feet. The quotient is the breaking weight at middle in tons." This supposes a tensile strength of 7 tons. Some remarks on wrought iron flanged beams will be found of service. Beams can be rolled to lengths of 30ft., but the cost is less per ton when the length does not exceed 20ft. We here cull from an extensive table a few data that will be of value. Thus taking a span of 10ft., we find a rolled iron joist of 4in. deep, 3in. breadth of flanges, with a web of ¼in. and a flange of ¾in. thick, has a weight of 12lb. per lineal foot, has an ultimate strength in middle of 3.8 tons, and a safe permanent load of 25cwt. A beam 6in. deep with 5in. flanges ½in. thick, and a web of ⅞in. weighs 30lb. per foot, has an ultimate strength in middle of 15.1 tons, and a distributed safe load of 101cwt.; a beam 8in. deep, with 4in. flanges ½in. thick, and web ¾in., weighs 21lb. per foot, has an ultimate strength in middle of 15.4 tons, and a distributed safe load of 103 cwt.; while a beam 10in. with 4½in. flanges ¾in. thick, and a web of ¾in., weighs 36lb. per foot, has an ultimate strength of 34 tons, and a safe distributed load of 227 cwt. To find the strength and safe loads for beams of other spans, divide the weight given above or in the table by 10, and multiply quotient by given span. Mr. Clark furnishes the following approximate rules for the strength of solid wrought-iron joists of ordinary proportions:—"To the sectional area of one flange add one-fourth of the sectional area of web calculated on the total depth, both in inches; multiply the sum by the depth in inches and by 7, and divide by span in feet; quotient is breaking weight at middle in tons. Another rule is: Multiply breadth of joist by square of depth in inches, and by 0.6; divide product by span in feet; the quotient plus 1 is the breaking weight at middle. For hundred-weights substitute 12 for the multiplier 0.6 in the preceding rule; the quotient plus 20 is the breaking weight. The first rule is the most correct. A very full table of the crushing and tensile resistances of stones, brick, cement, &c., is given, from which we find that red bricks have a crushing strength of .358 tons per square inch; yellow-faced burnt, .643; gault pressed, 1.111; stock brick, 1.044; red Farehams, 2.500; brickwork in cement, .232 tons. Results published by different authorities vary so greatly in these matters that we have some hesitation in accepting the figures given, but the above are the most recently published, and as such we may regard them as having been verified.

FLIMSY CONSTRUCTIONS.

LAST week we noted a few recent failures in America, arising not so much from imperfect design as clumsy and defective workmanship. The modern contract system is undoubtedly at the root of this evil, and it behoves the architect or engineer to anticipate this vice of the age by giving such a margin of safety to his structures as will compensate for the inevitable tendency of the contractor to scamp. Doubtless it is a bad doctrine to hold that the cupidity of contractors should be neutralised by increasing the quantity of material—in fact, substituting mass for good workmanship—but even this is better than to depend for safety on the coherence of a few inches of brickwork, a weak pin, or the tensile strength of a slight tie-rod. We have lately recorded the failure of one or two bridges. The Ashtabula Bridge has been pronounced to be a “conglomeration of errors” and bad workmanship. The bracing has been proved to have been defective in both these respects, the points of connection of the bottom lateral bracing and the struts were faultily designed, the chords—upon which really depended the strength and stability of the structure—were actually strained by various forces, and the attachment of the braces tended rather to twist them into a zig-zag line than to preserve their rigidity and alignment. Then, again, we find from a recent discussion on the subject at the Annual Convention of the American Society of Engineers, that the attachments and joints were of the most flimsy kind, the transverse vertical braces were fitted by hooks into the angle blocks, and held in place by a small $\frac{3}{4}$ in. tap bolt; the main chords, which consisted of five lines of 6 in. I-beams placed side by side, were held together by two trumpery $\frac{3}{4}$ in. bolts in each panel, notwithstanding that the effective strength of such composite chords mainly depended on the frequent clamping of the five beams. The lugs to the main braces cast on the angle blocks did not fit properly, and the connections of the main braces with the counter braces were by 2 in. bolts that did not pass through. The bearings were equally defective; the chord bars had at one end a bearing on one edge only. As might have been expected, the examination of the wreckage has shown that in this instance failure took place by the buckling of the main braces, or top chords, which were so badly connected, and no evidence of derailment has been found. Again, in the case of the Bath-bridge accident, there can be no doubt the structure was too slight for its carrying capacity, and that sufficient margin of safety had not been given. The operation of time had been overlooked, and the original structure also tampered with. In many instances we have an inherent defect in design, or workmanship, increased by subsequent reparations or patchings. In a construction like a bridge the integrity of the structure is of the greatest importance. Unlike an ordinary building, a house for example, it admits of no tampering with its structural members—they must be replaced *in toto*, or not touched, and it is this principle that has been gravely overlooked in the reparation of our bridges. An attempt to repair a rib, or a chord, whether of timber or iron, must be attended with difficulty, if not danger; it is quite as difficult and as dangerous as the endeavour to replace an arch or keystone. In America theoretic nicety of design is too frequently purchased at the expense of solidity and massiveness, and the very slightest imperfection such as the buckling of a chord, the connection of a brace, a weak pin point, or an uneven bearing, is enough to destroy the value of the nicest theoretic calculations upon which the structure was designed. Let it be understood we

by no means undervalue theoretic design; on the contrary we should pronounce that work a failure which was based on mere rule of thumb or empiric knowledge, but we contend that after proportioning his members by theory the engineer or architect should add a considerable margin of strength to them, not by merely adding to their weight of material or substance, but by endeavouring to increase the areas of resistance with the least possible augmentation of dead weight. Thus there can be no doubt that if the chords of the Ashtabula bridge had been tubular, instead of a series of flanged beams inadequately tied to each other, the same, or even a less amount of iron would have sufficed. Mr. Squire Whipple, in the recent discussion, said that in his opinion this bridge owed its destruction to an excess of 6 in. I-beams in its compressive members. The fable of the old man, who broke the bundle of sticks one by one to enforce upon his sons the lesson of strength in union, and weakness in division, is a good illustration; and if half the material in the braces and chord had been used in the form of phoenix columns, or a hollow well-proportioned form, the result would have been otherwise. In this case, there was clearly too much metal in the upper chord, and not sufficient in the bracing; in fact, the braces, it has been shown, were so defectively tied or stiffened, that they virtually resembled struts or columns of 105 diameters in length. Although the design of the truss of this bridge (trapezoidal, filled with verticals and diagonals) was one of the best, theoretically, there was a defective apportionment of the material—certain practical conditions were overlooked, as that of lateral stiffness; the thrust members or braces were made longer than the tension members or verticals, and the floor-beams were placed between the supported points of the chord. All these errors show that in this instance both theory and workmanship were in fault. If the braces had been of two pieces braced between, as at Charing-cross railway viaduct, and if the upper chord had been a tube, we very much doubt whether such a frightful and fatal accident could have happened.

To take another case, the late Rockford Court-house, brick piers are carried up to a height of 30 ft., without the exercise of that due caution necessitated by the weighty superstructure which they had to carry. Here the contractor, if we are to believe the statements made, actually reduced the dimensions of the piers, without the architect's knowledge, and reduced their strength also by inferior workmanship. We desire to caution the young practitioner against the error of imagining that his areas of support in piers and columns, as shown on a plan, can be implicitly relied upon. Though their substance may be enough theoretically, he has to count against a dishonest contractor, or a scamping bricklayer or mason. A few badly burnt or soft bricks, a layer of poor mortar, a core of rubble, to say nothing of a bad foundation, may really diminish the strength of a pier or column of masonry 50 per cent. at the very least. Experience in building operations has shown us that the contractor's scamping is in the unseen portion of buildings, in the filling-up or backing of walls and piers, and just, in short, in those parts where the architect's eye would be least drawn to. It is quite true a brick pier may carry from a $\frac{1}{4}$ of a ton to 1 ton per square inch of section, but how much of the available area shown by the architect or his plan is utilised at such a pressure is the chief point to consider. The question is, whether the workmanship and material are in a fair proportion to the area of the parts, and to insure their being so is the duty of the supervisor of every building. For instance, an 18 in. pier in soft or friable brick will not

sustain more than 30 tons; but if built of hard well-burnt brick the same pier will sustain four times that amount. Architects are prone to err on the side of massiveness, without considering whether the solidity is fairly utilised, or whether it is so much material thrown away. A heavily-timbered roof may ultimately cause its own destruction. These considerations lead us to the importance of combining as far as practicable theoretic or scientific excellence with sound workmanship and material—that is to say, that some due proportion be observed between the theoretic breaking and actual load or strain; between the strength of the structure, calculated theoretically from the design, and the actual strength of its weakest part. As regards bridges, the American engineers are in favour of annual or biennial inspection, and the State legislatures are passing laws to provide for the inspection of railway and other bridges; and we find the loads for different spans specified. Thus, for spans of 15 to 20 ft., 5,000 lb. per lineal foot for each track is provided; bridges, with spans of from 30 to 40 ft., 3,700 lb.; from 40 to 50 ft., 3,300 lb., and so on by a diminishing scale of loads. We are of opinion that the inspectors should be independent; that they should be experts in bridge construction; and that the varying systems of construction should be considered. A factor of safety should be enforced, and this should be for the structure and not the mere material. It should be at least 4 to 6, and the limit of strain should not be above 10,000 lb. per square inch. As the strength of every structure is that of its weakest part, it is absolutely necessary that an inspection should include that of the minutest detail of each part under a running load. It is quite evident the fatal calamity at Bath would have been averted if it had been clearly seen that the margin of safety had considerably dwindled, or had been grossly over-estimated.

TEWKESBURY ABBEY.*

CONSPICUOUS among the earliest works of the great church-builders who rose up in England after the Norman Conquest are the three abbey churches of Gloucester, Pershore, and Tewkesbury. They were built in near neighbourhood, and were essentially of the same type—a type which had certain peculiarities that we find nowhere else. We may therefore safely assume that the same hand designed the three.

A monastery had existed here since the seventh century; in the latter part of the eleventh century it was a mere dependency of the Benedictine Abbey of Cranbourn. But at that period the establishment was removed from Cranbourn to Tewkesbury, and then an entirely new monastery required to be built, the conventual buildings of which were completed ready for habitation in 1102. The founder of the new order of things was Robert Fitz-Hamon, to whom his relative, William Rufus, had granted the Honour of Gloucester, which included the Lordship of Tewkesbury, and he and his descendants were the patrons of the abbey and the promoters of all the important works that were done here until shortly before the time when the monastery was dissolved in 1539. Fitz-Hamon died the death of a warrior in 1107, and his eldest daughter marrying Robert, the natural son of Henry I., he became Earl of Gloucester and patron of the abbey, and in his presence the church was consecrated with great state on the 20th November, 1123. Although he is said to have built a wooden spire covered with lead, it is probable that the great central tower, so much more ornate than the rest of the building, was not then built, but we may fairly infer from the existing structure the plan and general

* Read in the Abbey before the members of the Royal Archaeological Institute of Great Britain and Ireland, and of the Worcester Diocesan Architectural and Archaeological Society, by THOMAS BLASHILL, architect, August 14th, 1877.

design of the church as it stood in its stern grandeur on the consecration day.

The plan was no doubt that which was then common, consisting of a long nave with aisles and a transept, the choir (or more properly the presbytery) being very short, and ending in an apse. So much of the plan still exists, and at the east side of the south arm of the transept remains a semicircular chapel as was usual, the transept of Pershore still showing the like. A similar chapel opened out from the north transept, and we may reasonably conclude that the church terminated to the east with a Lady Chapel and two other small chapels that projected from the aisle which went round the apse. Another feature which we see here, and which is common in churches of the same date, is the carrying of the central tower absolutely, without any projection of the four great piers into the area of the church, so that nave, tower, and choir preserved one clear width throughout.

The great feature which distinguishes the three churches I have named is the immense height of the circular pillars of the nave, which are here 30ft. high, or 3ft. higher than the nave pillars at Gloucester. A very low and insignificant gallery runs over them, and above it were the original windows of the clerestory. In each church the pillars of the choir were low, and the aisle that ran round the choir were in two stories, a second arcade of low arches being imposed upon the lower arcade. This upper aisle, or triforium, was easily accessible by way of the staircases at the angles of the transepts. Owing to the all but total destruction of the nave at Pershore, we cannot make any detailed comparison with it; but comparing this church with that of Gloucester, there is here a much greater plainness and severity in all the leading features. But Tewkesbury is distinguished from all existing churches by the great arch which spans the entire width of the west front of the nave. It has been conjectured that this archway opened into a large vestibule, and that the true west wall of the nave was a few feet within it. It has also been supposed that a great western tower existed outside it, and that in fact it was an ordinary tower arch opening out from the west end of the nave. But it is clear from the masonry that is now exposed to view, that it was filled in with a wall which would have some arrangement of windows and probably a door. On each side of this arch the original design was to build a large tower, each tower standing over the end of one of the aisles. The walls must have been carried up as high as the aisle roofs, for portions of them still exist in those roofs, roughly broken off from the walls of the nave, and there also still exist the original corbels of the aisle roofs: but nothing more than the smaller turrets over the staircases appear to have been actually done. These turrets have been rather extensively repaired. I feel sure that the groups of conical finials at the top have been wholly rebuilt, the original design being now doubtful, but we know from old drawings that something of the same general outline existed there towards the end of the seventeenth century. The great central tower (which may be compared with that of St. Alban's, but not with the towers of Durham, which belong to the following century), is a very fine specimen of fully developed twelfth-century architecture. Rich arcades with windows are formed in it, which were visible from the floor of the church until the erection of the present vaulted ceiling. In the interior of the tower we can see these fine arcades, which are part of the original construction. Above them is the great mass of the tower, of different workmanship and built of different stone, which together with its design indicate a later period in the twelfth century for its construction. Originally the tower must have had four square angle pinnacles, which in the fourteenth century gave place to groups of light crocketed pinnacles with battlements between them. The pinnacles which now exist were built in 1600, the tops of the old crocketed pinnacles being replaced above them. The great north porch is of the twelfth century; it has a chamber over it accessible from the church, and which had a circular-headed window, which is now filled up with a figure of the Blessed Virgin

under a canopy. There are some slight remains of the monastic buildings of this period; they were burnt in 1178, and rebuilt, to be destroyed again, at least in part, and again rebuilt in the fifteenth century.

The church remained without material alteration from the time of Earl Robert for 100 years, during which time this Earl's son, William, and after him the husbands of two of his daughters, were successively Earls of Gloucester. One of these was Prince John, afterwards to be King. In 1221 Gilbert de Clare, Earl of Hertford, the son of William's daughter, Amice, succeeded to the Earldom of Gloucester, and the De Clares were patrons of the Abbey for 98 years, which period coincided with the best period of 13th century and early 14th century architecture. Of the very little work of the 13th century that remains in this county, some very fine specimens exist in this church. In 1237 Prior Sipton built, or re-built, the chapel of St. Nicholas, which is supposed to be the small apsidal chapel on the east of the north transept; but a much larger and more elaborate work was carried out at about the same time, at the end of the north transept. A handsome archway was opened through the north wall, giving access to a building resembling the nave of a small church, to the eastward of which was a chancel opening from it by a very graceful arch, divided by a central column and tracery. Great use was made of Purbeck marble in capitals, bases, and detached shafts; the windows must have had a very fine arrangement of columns and arches, and I think it is clear that the east end had a fine triplet of lancet windows. It has been thought that this was the chapel of St. Eustatius, built by Prior Henry de Bunhury, and dedicated in 1246; but it appears much more likely that a work of such size and beauty was built by the patrons of the Abbey for a much more important object. We know that at this time, somewhat early in the 14th century, it was common to attach Lady Chapels to the transepts of such churches as this on the side which was opposite to the monastic buildings. This was then the most convenient position; for where the nave was used as a parish church, as in this case, it gave the laity ready access to the shrine of the Virgin without interfering with the choir of the monks. In such a position in Bristol Cathedral is the building called the "Elder Lady Chapel," which is of a similar style to this. Here there was a chapel already existing in the angle of the choir and transept, and therefore this large chapel was built beyond the transept with a finer effect than I remember to have seen elsewhere. The "Annals of Tewkesbury" state that in 1239 the church was dedicated, "with the major altar in honour of the glorious Virgin Mary." I am inclined to think this refers not to the major altar of the church, but the major altar of the Virgin, the small Lady Chapel at the east end being still in use by the monks. I only throw out these suggestions for what they may be worth. The last male De Clare was killed at Bannockburn in 1314, and his sister having soon after married Hugh Despencer the younger, the favourite of Edward II., that family became the patrons of the Abbey until 1414, another period of about 100 years, which included nearly the whole duration of the 14th century style of architecture. It was during their time that the great alterations were made which changed the eastern portion of the building from the simple arrangement of the twelfth century to the most fully developed form which was ever adopted for the chancels of our great churches, and materially altered all other parts of the church in correspondence therewith. It has been pointed out by Sir Gilbert Scott that this work must have been done by the same architect who built the towers of Pershore Abbey and of Salisbury Cathedral. The greater part of it was certainly done close to the time when Tewkesbury was in the possession of Elizabeth, the widow of the third Hugh Despencer. She was a Montacute, the daughter of the Earl of Salisbury; we do not know whether this may have influenced the choice of the architect, or whether it is a mere coincidence. She held Tewkesbury from the death of Hugh, in 1349, to her own death, in 1359, and her second husband, Sir Guy de Brien, Lord Welwyn, who lived till 1390,

and was a benefactor of the Abbey, seems to have been closely concerned in the work. The mode in which this work was carried out deserves very careful attention.

The chapel attached to the end of the north transept had been built about 100 years; it was but slightly attached to the massive Norman walls, in which a settlement had taken place, perhaps sufficient to cause the ruin of the nave of the chapel, which either fell or was taken down, and a strong buttress placed against the transept; but the whole building was exceedingly light and fragile. The projecting chancel was preserved, a fine flying buttress and other strong buttresses being added to it; new windows were put in, and the vaulting reconstructed, new ridge ribs being added, the bosses of which now bear the arms of De Clare and Despencer, indicating probably that it is the work of Hugh Despencer, the husband of Isabelle De Clare. A wide archway was formed in its south wall, and the existing chapel in that side was similarly joined to the north aisle of the choir. Even before this time the need of additional chapels must have been felt, for the monastery, instead of providing a separate parish church for the people, as was usual with the large Benedictine houses, had admitted the people into the nave, reserving for the monks the choir, the tower space, and the eastern end of the nave; thus two distinct classes of persons, who must be kept separate, had to be provided for, besides the lay brethren and guests of the monastery. To meet these requirements they now built a new aisle round the choir, and in place of the three small chapels of the old aisle they built six chapels and a vestry, the chapels radiating from the apse in the form called a chevette. This was not copied in any way from the thirteenth-century chevette of Westminster Abbey; it was an idea that must have been perfectly familiar to all the leading people in England, for our long possession of French territory and the Continental wars in which the patrons of the Abbey were engaged would cause many such examples to be seen by them. The central or easternmost of the three chapels would be the new Lady Chapel, accessible at proper times to the people, a screen being fixed between the great piers to enclose the choir of the monks.

The most remarkable thing about this is that the new aisle and chapels were built before they thought of building the new arches and upper part of the choir. This assertion, which I have before made, has been disputed, but I think it is proved by an examination of the work. The new aisle was kept low in order that its vaulting should rest against the old twelfth century choir just above the arches of the lower arcade, and below the openings into the upper arcade or triforium. This could never have been done deliberately if it had been intended to build the present choir, for not only are the aisle and chapels kept much lower than they need be (too low indeed for good proportion), but the spandrels of the vaulting were left to show below the new pointed arches of the choir. To get over this disfigurement they filled in the spandrels with diaper patterns, and provided new vaulting ribs to carry them. On looking at the work from the side next the aisle, we may see the parts of the old Norman capitals which were left to carry the vaulting, and notice how the old piers were raised on the side next the choir, in order to carry the new arches, the whole being certainly a clever piece of contrivance to meet an emergency, but not the deliberate design of men who saw from the first to what their work would extend. The new choir had no triforium, or second story, to the aisle, its great windows extending the whole height from the arches, which carry it, to the vaulted ceiling; therefore the large arches which had opened from the second story of the old aisles into the transept were filled in with windows, which are of very elegant design.

The choir being built, vaulted ceilings were put to the rest of the church. Those of the transepts resemble that of the choir. The splendid vaulting of the nave, which bears on its bosses exquisite carvings representing the history of our Lord, seems to have followed. There is on a boss of one of the aisles a shield bearing the Despenser arms. The tower was

now filled in with a ceiling that bears the arms of Despenser, Sir Guy de Brien, and Montacute, also a curious shield, which bears Montacute on the dexter side with Sir Guy de Brien on the sinister. Many windows were at the same time put in all parts of the Abbey, all being of late 14th-century character. The design of the chapels round the choir included a new Lady Chapel, which would occupy the central or easternmost place. There is a tradition that it was 100ft. in length, and it must have been large, lofty, and of very elegant design. The arch that opened to it from the choir aisle exists, and indications of an open screen of stone that was added to it very much after the manner of the screen of the Lady Chapel at Gloucester, have lately been exposed. We shall be able to judge of the lofty proportions of the chapel from the private grounds at the east end of the church, and through the kindness of Mr. Brown, its foundation has been exposed to view. Doubts have been expressed as to whether it was ever completed, but it is clear that the windows were fitted with iron work for glazing, and that whenever it was destroyed, pains were taken to make good the broken masonry against the church with the greatest neatness and finish.

With the completion of the fabric of the church commenced the series of minor constructions, consisting of elaborate tombs and chantry chapels for which Tewkesbury is celebrated. There is an early 13th-century tomb in the south aisle to Abbot Alan, who died in 1202; and there are, besides, some other noticeable monuments of a minor character. The first of the remarkable series now commenced is at the back of the sedilia, to the right of the high altar. This is said to be the tomb of Hugh Despencer the younger, the favourite of Edward II., who was hanged at Hereford a few years before the new chancel was built, but there is no proof of this, though it is on record that he was buried on this spot. In the corresponding position to the north of the high altar is the tomb of his son, Hugh Despencer "the Third" (but the second of the Tewkesbury Despensers) and his widow, in whose time the choir was built, and opposite to it, at the entrance of the north chapel of the chevette, is a similar monument to this lady's second husband, Sir Guy de Brien. Then we have on the north of the choir a chantry chapel built in 1397 by Abbot Parker, over the spot where he supposed the body of Robert Fitz-Hamon, the founder of the church, then lay. Opposite to this is a chantry, called by some the "Trinity Chapel," a painting of the Trinity being still to be seen in it. It was built to commemorate Edward, the nephew of this last Hugh Despencer, whose kneeling figure is under a canopy on the top of it. The upper part of the chapel is later than the date of his death in 1375, and seems to have been substituted for a former structure, the lower stage being of different and earlier character. The most elaborate of these chantries is that built by Isabel, the heiress of the Despensers, to the memory of her first husband, Richard Beauchamp, Earl of Worcester and Abergavenny. It is called "The Warwick Chantry." Why this should be is not clear, for it was completed before the foundress married her second husband, Richard Beauchamp, a great, though not the greatest, Earl of Warwick. It is really the Beauchamp chantry, and is one of the most splendid specimens of that class of structure.

The last work of great importance that was done to the Abbey was the rebuilding of the cloisters in the style of the 15th century. Enough of this work remains to show that it was of the richest character, resembling that of the cloisters at Gloucester, and covered with fan vaulting. The doorway which gave access to the church seems to have been inserted at a later date, and is of magnificent design.

Of the monastic buildings but little remains, though the gate house, the abbot's lodging, and some few buildings were retained for various uses. But overshadowing them all in interest, and growing day by day in beauty, is the church, to which the noblest names in English history are linked by durable memorials. Let us hope that neither names nor funds will fail it now when it is being restored to a state in some measure worthy of its ancient beauty and grandeur!

THE ARCHITECTURAL ASSOCIATION IN WARWICKSHIRE.

DURING last week the members of the Architectural Association have held their eighth annual gathering at Warwick. Monday week was devoted to the town, and at eleven o'clock, according to previous arrangement, Mr. J. Tom Burgess, F.S.A., the Rev. C. Newcomb, Mr. F. Moore, and others met the party at St. Mary's Church, which was thrown open for the occasion. Mr. Burgess said he was placed in a somewhat difficult position, because he had to speak to a body who had a special object in view, and the Church of St. Mary's, Warwick, was somewhat of an anomaly in architecture. To clear up any bewildering doubts that might arise on entering the nave, he would reverse the usual order of description, and, like an auctioneer, commence at the lowest and pass on to the highest date of the church. They must not forget that there had been a fire in Warwick, for on September, 5, 1694, the greater portion of the town was consumed by fire, which broke out in Britain's-lane, a little south of Leicester's Hospital, and was fanned by a strong south-west wind until it reached the Old Three Tuns, in Jury-street, whose strong stone walls resisted the flames. The wind then seemed to have turned, for the flames then took a direction towards the north-west. The affrighted inhabitants brought their goods to the church then standing, and with the goods sufficient fire to consume the chapel, except the choir, Lady's Chapel, and chapter-house. The total loss was estimated at £90,000. The Crown appointed commissioners to superintend the rebuilding of the church, for which Sir Christopher Wren appears to have made designs, but the work was ultimately given to Sir William Wilson, a gentleman, who, though his tomb at Sutton Coldfield states him to have been a good freemason, certainly had most incongruous ideas of architecture, for though the stately tower and general proportions were worthy of all praise, a worse mixture of Classic and Gothic ideas could not well be conceived. The nave and tower of the church were finished in 1701, at a cost of £4,874 9s. 5d. Various little details of some interest were pointed out, particularly the section of the piers, which were similar to many fifteenth-century churches in the Midlands, and the substitution of the Pagan urn for the Christian cross in the parapets over the horse-collar tracery of the aisle windows. Proceeding to the choir, Mr. Burgess pointed out that though they had a date, 1392, as the period of the building of the choir by the second Thomas de Beauchamp, Earl of Warwick, the east window appeared half a century later, and might possibly have been altered when the Lady Chapel was built. If not, it was one of the earliest examples of the kind in England. The open ribs of the roof were generally much admired. Originally, they were of the stone of the neighbourhood, but when the restoration took place the decayed ones were replaced by wooden ribs sanded over. The roof had been partially destroyed by the great fire, and the melted lead had injured the fine panelled work, which had been touched up with cement. The sedilia, piscina, and the hagioscope from the chantry chapel were duly pointed out, as well as the details of the tomb of the founder, the figures round which, as Mr. Burgess pointed out, were excellent studies of the costume of the fourteenth century. To those curious in the armed panoply of their forefathers, he mentioned that this church and Charlecote, which they would visit the following day, contained effigies clothed in every variety of plate armour, whilst the rich stores at the castle gave some earlier examples and many variations of fashion, details, and manipulation. The party then proceeded to the vestry and lobby, remarking the fifteenth-century screen which divided them, and the groining of the roof. The chapter-house, now filled with the Jacobean tomb of Fulke Greville, was visited; and, in answer to the vicar, Mr. Burgess said that though there were nine seats, there were a dean and five prebendaries, and the incumbents of some of the neighbouring churches had a voice in the chapter. He could not tell the exact number of the chapter. The crypt and the exterior on the northern side

were next visited. The Norman work of Earl Roger (circa 1123) was pointed out, together with the tumbrel of the ducking-stool.

In the Chapel of our Lady Mr. Burgess gave a brief description of the building, which was erected in accordance with the will of Richard Beauchamp, Earl of Warwick, who died at Rouen, in 1439, and whose body was brought to Warwick, and laid in the church until the chapel was finished. They had full illustrated details of the ceremony. The roll of expenses still preserved, the full details of the cost of the latter work, of the figures in the housings of the tomb, the richness of the armorial bearings, executed in silver and gold, together with the brass hearse and effigy, were dilated on, together with the peculiarity of the armour. The tombs of Ambrose Dudley, the "good" Earl of Warwick; that of Robert Dudley, Earl of Leicester, together with Lettice Knollys, his wife, and the "noble imp," their son, were noticed, together with the singular gift of Lady Levison Gower, of £50, to keep the chapel in repair in honour of "her grandfather." The Chantry Chapel, with its fan tracery, its peculiar lobby, together with the small chapel generally known as "the confessional," was the subject of much comment—Mr. Burgess maintaining that confession boxes were unknown in the inventories of the churches of England prior to the Reformation, though it appeared that the low side "windows" were used for such purposes. The party then proceeded to sketch the interesting details, whilst a few accompanied Mr. Burgess to inspect the brasses of the Okens and Beauchamps, the entrance to the Beauchamp Chapel, executed by Samuel Dunckley, a Warwick mason, in 1704; and the plaster altar-piece, designed by Collins, erected in 1735.

At four o'clock the entire party met at the Castle, when Mr. Burgess again acted as guide, giving a brief historical account of the castle and the ascertained dates of every portion of the edifice visible. Towers, dungeons, mound, and out-works were visited, and Mr. Hill, the house-steward, showed the state-rooms, armoury and crypt, Mr. Burgess pointing out the peculiarities of the armour and their historic associations, as well as the effigy in the chapel. After a long investigation the party dined together at the Warwick Arms, under the presidency of Mr. Paice.

On Tuesday the Association visited Stratford-on-Avon by way of Snitterfield, where the carved work drew forth many tokens of admiration, and many "bits" were eagerly sketched. Then, by way of Ingon Hall, to Stratford, where, at Holy Trinity Church, Dr. Collis gave a very interesting and exhaustive account of the architecture of the building. After luncheon at the Shakespeare, the party went to the Chapel of the Holy Cross, where Mr. J. Tom Burgess gave a description of the architecture, both of the exterior and the interior; a history of the frescoes, now obliterated, which were on the walls and over the chancel, representing the Last Judgment and the punishment for committing the seven deadly sins. The Grammar School was next visited. Here Mr. Burgess gave an outline of the ancient Guildhall, where the justices formerly sat—in fact, to the beginning of the present century. He also described the ancient chamber where the Town Council, until very recently, carried on their deliberations, the rooms in which tradition had it that Shakespeare acquired his "little Latin and less Greek," and where, in all probability, he saw his first play. From hence to Hanley-street, a party detached themselves to sketch the "glover's house" in High-street, whilst others stopped to look at some quaint-timbered houses between Henley-street and Wood-street. Subsequently, all met at the birthplace of the poet, where Mr. Burgess gave a history of the whole building, its original plan in the dramatist's day, the purposes to which it has been applied, and the alterations which had been made. He described the portrait picture of the poet, its discovery, treatment, mode of restoration, and its similitude to the bust in church. The documents, records, and relics in the museum were minutely detailed, together with the curious inventory of the goods of Rookwood, one of the Gunpowder Plot conspirators, who resided for a time at Clopton. Mr. Burgess took the party to some open-timbered houses

existing in Rother-street, at the rear of "The Firs," and stated that they were the only specimens in the county of that peculiar style of building. The party departed at four o'clock from the Shakespeare Hotel, taking en route the site of the New Theatre on their road, that they might see the foundations and the satisfactory progress made with the building; thence by Tiddington and Alvestou to Charlecote Park and mansion of the Lucys, which was most courteously thrown open for inspection.

After many thanks the party accompanied the Rev. Mr. Granville, Vicar of Charlecote, to visit the comparatively new parish church in the park, designed by John Gibson, and inspected the monuments of the Lucy family, particularly the exquisitely-executed effigy of Sir Thomas and Lady Lucy, of the Cavalier period. The party then divided; a portion went to inspect the garden front of the hall, and the others to see the imposing Church of Hampton Lucy, in company with Mr. Rickman, the first designer of the church. This structure, which is a fine monument of the late Rev. John Lucy, is imposing; for, though the greater knowledge of Gothic details we now possess enables many defects to be pointed out, the church is a fine one. The work of Sir Gilbert Scott, at a later period, scarcely harmonises with the ideas of Mr. Rickman, but as a whole the church was pronounced satisfactory. The party united at Charlecote, and, after a pleasant drive, reached the headquarters in time for supper.

On Wednesday the party visited Coventry by train. The morning was spent in inspecting the churches of the city, St. Michael's and the Holy Trinity, many of the members making sketches of various interesting architectural features which are to be observed. At both churches Mr. Fowler (of Louth) made explanatory remarks, pointing out the principal characteristics of the edifices, and those most worthy of the attention of the architectural student. At 1.30 the party sat down to luncheon at the Castle Hotel. The party then proceeded to St. John's Church, which, with the hospital adjoining, was inspected. The old timber houses in Well-street and the Free Grammar School were next visited. St. Mary's Hall and its treasures in the muniment-room came in for examination, and the visit terminated with a visit to Ford's Hospital, the visitors returning to Warwick by the half-past 6 train.

On Thursday the party left by break and omnibus to Wroxall, and inspected the conventual church there, and the site of the abbey, founded by Hugh de Hatton. Some of the features of this building, which have been excellently restored, were much admired. By the courtesy of Mrs. Dugdale, the pictures were seen and admired. This visit, in consequence of the connection of Sir Christopher Wren with the spot, was peculiarly interesting. At Bedlam's End, the old trees (patriarchs of the Forest of Arden) were noticed on the way to Knowle, where the sketchers had a rich treat in the church, hall, and in the many half-timbered houses of the place. The rood screen in the church, and the many details, though of a late period, were highly interesting. Half-an-hour was soon exhausted, and thence through pleasant green lanes, by rippling brooks and shady groves, to Temple Balsall, the old preceptory of the Knight Templars, Mr. Fowler pointing out the architectural features. The old preceptory was visited, after which the party left for Kenilworth, which they reached at 3.20 p.m. Here Mr. J. Tom Burgess again took charge, and conducted them over the ruins. The outworks, brays, and the chimney-pieces were visited, and then the party proceeded to the church, where the Norman west door and the corbels of the north transept attracted the sketching party. The communion plate, given by Dame Duchess Dudley, was exhibited, and the party then proceeded by Leek Wootton to Guy's Cliff.

On Friday the party went to Whitnash, and inspected the Church of St. Margaret's, and the old half-timbered Manor House, inhabited by Mr. Palmer. From thence to Tachbrooke, not forgetting the old chapel at Tachbrooke Mallory. Here again the gabled panelled houses attracted attention, as well as the simple piers of the nave of St. Chad's Church, its

twelfth-century north doorway and other early features. From Tachbrooke to Chesterton the Fosse-road was crossed, but here the work of Inigo Jones in the two mills, the bridge, and the entrance to the church were noted and sketched. At Harbury the timbered houses and the old school of the Wagstaffs were the principal objects of attraction. Southam, with its quaint houses and fine church, afforded a fine theme for Mr. Fowler, and excellent subjects for the pencil. Stoneythorpe was visited on the return journey, and in the evening, at the final dinner, Mr. J. Tom Burgess exhibited some of his water-colour drawings of Warwickshire houses, including the Rollwright Stones and Baddesley Clinton, together with other architectural features of the county. The members accorded him by acclamation a cordial vote of thanks, and expressed, through their president, the great gratification they had experienced during the visit from the beauty of the scenery, the interesting objects visited, and the graphic details and historic notes which had been given them by Mr. Burgess and others.

On Saturday some of the domestic buildings, the College, St. John's, and Leicester's Hospital, were visited.

ART FURNITURE.*

WE have before us a rather choice collection of designs for domestic furniture and decoration in the shape of a catalogue issued by Mr. William Watt, the well-known art-furniture manufacturer, of Grafton-street, Gower-street, W.C., and published by Mr. B. T. Batsford, of High Holborn. The designs are by E. W. Godwin and other artists, and display a decided taste for the truthful and simple in workmanship. In going over the twenty plates that have been photo-lithographed in a good style we come across one or two that have already appeared in the pages of the BUILDING NEWS. We note especially plate of an interior of a dining-room in the Old English style, which we published November 17th, 1876, and which may be taken as characteristic of many of the designs given. Every kind of furniture suitable for the hall, to the drawing-room, and to the church choir, is illustrated, from the simplest Old English to the Queen Anne and Anglo-Japanese style. The selection includes examples for every room in the house. Thus we have the hall-chairs and hat-stand; the buffet, couch, and chairs for the parlour; the sideboard and hanging bookcase for the dining-room; the cabinets, pianos, sofas, and ceiling and wall decorations of the drawing-room; the library and bedroom suites, from which selection the most captious taste may be satisfied. The designs for what is called "economic furniture" are appropriate and simple. The Japanese furniture is particularly light, open, and elegant; thus we see a useful writing table, wing cabinet, and escriptoire (plate 8), and a very pleasing sofa treatment, well adapted for a drawing-room; but we do not like so well the mantel-piece in the "student's furniture" (plate 4), which is rather too fanciful an adaptation of Japanese to our minds. The mantel-piece in plate 6 is far more English and sensible-looking, and adapted for a display of china. There is, we think, a danger in seeking to introduce the forms of Japanese to English wants, and a forced style is to be reprehended. The cabinet in the Queen Anne style (plate 12) is exceedingly good, and we find the sensible plan of raising the lower cupboard on high legs is resorted to in most of the furniture illustrated, so that the air may freely circulate underneath, and the housemaid's brush be brought into requisition. The fault of most modern, and indeed old, furniture is that there is little room for the brush, and the circulation of air is impeded. Mr. Watt has primarily studied this essential, and has given his furniture a light and wooden appearance, and one we cannot mistake for any other material. The buffets shown are generally light and simple-framed on the Japanese principle of not producing more solidity in the supports than

actually required. We may note the buffets on plates 4, 5, 6; the library furniture, plate 11, in a semi-Renaissance taste; the bedroom furniture, plate 13; and the drawing-room, plate 14, as containing suggestions. Ceiling decoration is illustrated, though we scarcely like the designs shown. The author's hints which preface the catalogue are suggestive and to the point. The importance of good light and plenty of fresh air is insisted on; and speaking of the dining-room the author protests wisely against the fashion of filling that apartment with heavy and dark sideboards and chairs, and suggests for all rooms the cleanly custom of having polished oak floors, or at least a margin of parquet, about 2ft. of it, round the walls. The stove should have as little iron as possible, and should be chiefly made of tiles or terra cotta; the walls should have a dado, and the paperhangings should get lighter towards the ceiling, which should be decorated in raised plaster work, paintings, or paper patterns. As regards the drawing-room, it is hinted that there should not be a strongly-marked contrast between the walls and furniture; and Indian matting, warmed up by a few Persian or Indian rugs, is recommended. For bedrooms, polished floors, and Hungarian or American ash furniture are to be preferred, and all furniture should be well clear of the floor, and flat-topped articles should be kept low enough for dusting. We recommend the furnisher of a new house to consult Mr. Watt's suggestive guide.

MOCCAS CHURCH.*

MOCCAS disputes with the banks of the Gwain, near Fishguard, the honour of being the birthplace of St. Dyffrys, or Dubitius, who lived about the year 470, began by being bishop of Llandaff, and afterwards Archbishop of Caerleon—the greatest representative of that ancient British church, which some have supposed was founded by St. Paul. The chronicler in the "Liber Llandavensis" describes Dubitius as dwelling for some time in a corner of the island of Eucidil, his mother's name, at Moeshæos, so called because an angel of the Lord appeared to him, and bade him build an oratory to the Holy Trinity, where a white sow was lying with her pigs. As it seems to me, a more suitable interpretation of the name than this convenient monkish legend would lie in the fact that the neighbourhood of Moccas is peculiarly favourable to the growth of the oak, and, therefore, to the feeding of large herds of swine—moch, in Welsh, signifying a pig, and rhos a large uncultivated space or moor. That which would seem to fix the dwelling place of Dubitius on the banks of the Wye, rather than on the banks of the Gwain, is the fact that four churches in Herefordshire are dedicated to him, and none in either Pembrokeshire, Monmouthshire, or Breconshire. As regards the date of the building of the present church of Moccas we have no record, and as the "Liber Llandavensis" is not considered trustworthy, any hints that might be gleaned from it are hardly worth explaining as far as fixing a date is concerned. I should rather prefer to leave the determining of its date in the hands of those who are able to form a judgment from the character of its architecture. You will find in the neighbouring church of Bredwardine traces of very early work, and an interesting Norman doorway. The original church of Bredwardine may have been built at nearly the same period as Moccas—the small round-headed tympana at the west end on its north and south walls would seem to be early; its basilical form and proportions have also been considered to point it out as Early Norman. At the time of the Domesday survey Moccas (spelt Moches) appears to have been divided between St. Guthlac's Priory (its site now occupied by St. Peter's Church, Hereford) and Nigel, the physician. Many explanations have been given of the Norman tympana; and De Caumont, who enters at some length into the question of sculptured tympana, remarks that they commonly manifest an Eastern origin. A tree of life or law in the centre, and monsters of various kinds on either side. There

* Art Furniture, from Designs by E. W. GODWIN, F.S.A., and others, with Hints and Suggestions by WILLIAM WATT, Art Furniture Warehouse, 21, Grafton-street, Gower-street. London: B. T. Batsford, High Holborn.

* A paper read in the parish church of Moccas, Herefordshire, before the Royal Archaeological Institute, by the Rev. Sir GEORGE CORNEWALL, Bart., on August 15th, 1877.

appears to be this tree of life in the tympanum over the south door, partly altered into a cross, to which human beings are holding when exposed to the attacks of the beasts. Mr. Bonnewell, who described it in this manner, was unwilling to extract any further allegorical meaning from this strange piece of sculpture. The north door, the door of the Evil Spirit, is also adorned with a tympanum, which is supposed to represent the Evil Spirit in the flames. Others have recognised Leviathan in the waters, or the wild boar rooting up the tree, but the first interpretation seems the true one, except that the tail of the beast terminates in what appears to be a crozier. The inserted Decorated windows contain fine canopies of stained glass, in which are represented the arms of de Fresne or De Frascino, Lords of Moccas. I discovered some years ago the site of the castle in which no doubt they dwelt. The remains of the moat are clearly traced, as also the causeway leading to it across the marsh. There is also an old tradition in the valley that the effigy in the church was that of a man who lived in the Meres, the site of the castle. It seems not unlikely that the effigy in the church was the same person who inserted the Decorated windows, and if it can be discovered to whom the arms in the window belonged it may be possible by this means to identify the knight whose effigy is in the chancel. The effigy is remarkable as regards armour, on which point I will leave it to Mr. Hartshorne to inform us. All I will add is that we have notices of three De Fresnes—Hugh de Fresne, who obtained a licence to erect battlements at Moccas in 1294; Walter de Fresne, member for the county of Hereford in 1307-8-9-10; Sir Richard de Fresne, 1375, after whose death the property was divided between his three sisters. I have also an account of the arms and pedigree of the De Fresnes, which Mr. Bayley has compiled, which I shall be glad to show to any one who is interested in the matter. I once met a Mr. Ashe, who claimed to be descended from the De Fresnes, and promised to send me his pedigree, but he never did so. The church was repaired in the beginning of the century by Mr. Westmacott. At that time the south window of the apse was like an ordinary cottage window, as I can show you by a drawing. He probably added the fireplace and chimney, and may have rebuilt the bell-cote. The church before it was recently restored by Sir Gilbert Scott was aisled, a semi-domical lath-and-plaster ceiling in the apse, and the effigy was then placed in the corner of the chancel. The chancel and the apse were both raised, and the windows of the chancel, which had been crushed and annihilated by the lowering of the walls, were restored according to their original design, there being little difficulty from the tracery which remained in determining the original design. The old glass was also restored. About half of it is new. There was great difficulty in procuring the travertine stone for raising the walls. About three waggon-loads were obtained from a wood of mine where this peculiar stone may still be seen in process of formation, and the remainder, through the kindness of Sir Thomas Winnington, who has a large block of it on his property. It is precisely the same stone as that of which the temples of Paestum are built. I have also seen it in process of formation at Tivoli and Terni. It is formed by a deposit of lime. As the water, strongly impregnated with lime, trickles over the roots and moss, the lime is deposited upon them, and hardens by exposure to the air. The chancel arches were terribly cracked, and had to be taken down and rebuilt. The porch was raised, and details imitated from the porch of Trevarton, about six miles off. Before the restoration the west wall was plastered up to a certain height, evidently for the purpose of a five-court. A very early sepulchral stone was discovered when digging round the church, which remains in the place where it was found. I cannot help pointing out, in conclusion, the admirable manner in which the interior fittings, chancel, stalls, &c., have stood since the work was completed. Thoroughly well seasoned oak is difficult to find, and it is to the credit of Messrs. Franklin, of Deddington, who executed the work, that I should point out to intending

restorers that it is possible to have work of this kind executed in a satisfactory manner. You will see that my object has not been to read an elaborate paper, but merely by a few rough notes to set before you the interesting features of this church. If I have succeeded so far, I shall have attained my object.

MYCENÆ AND ITS EARLY OCCUPANTS.*

IT was explained in this paper that the usual custom adopted by travellers and historians of describing ancient towns, as those of Mycenæ, Argos, Nauplia, &c., by the walls and other features peculiar to each, was not sufficiently comprehensive to convey an idea of the condition of society and military power in ancient times. They were seldom or never referred to by recent historians as parts of a kingdom, but rather as separate kingdoms, and their relationship to each other, except in cases of alliance or hostility, very seldom hinted at, and yet this was so partial a way of viewing the matter that it conveyed but a small amount of knowledge of those ancient times to which the Greek poets, as Homer, Æschylus, and others referred, and which poets were performed the first historians of those epochs.

These historians, however, if faithfully examined, would be found to deal with the question not only on a broader base, but one which was also a more faithful picture of facts. Thus Agamemnon was king of Argos as well as Mycenæ, and his kingdom would be found to have extended not only over those cities, but also to a great part of Corinth; while Menelaus, his brother, governed a large portion of territory in the Peloponnesus. The object of drawing attention to these points was to account for the number of minor Cyclopean works which were to be found on a careful inspection around the Argolic district, and which could hardly be accounted for on other grounds than by supposing they were used as outworks or garrison towns by the House of Atreus. Too small in themselves to be independent fortresses, they showed that even the larger ones were not independent either, and a military organisation and governmental rule were thus shown to have existed among a people referred to as a barbarous people, whose works and actions could only be explained by referring them to the mythological Cyclops. The particular features of some of these outworks were very peculiar, and the pyramid was a favourite form of those most remote from the centre of government. These pyramids the author had found east and west of the Argolic plain, at the extreme boundary of the Parthenium mountain, and as far almost as Epidaurus, while between them and the great fortresses bearing classic names was many an unnamed and unnoticed Cyclopean structure of considerably larger dimensions than the pyramids, yet bearing no comparison with the larger cities. These garrison forts, as he should venture to call them, were placed in most commanding positions, and evidently guarded the passes to the great Argolic plain. The discoveries made by Dr. Schliemann would be soon under their notice in his forthcoming work; he should, therefore, forbear touching upon them, as it was ground that that great investigator was exclusively entitled to tread first, whoever might subsequently support his theories, or enter the lists with him antagonistically. But having seen a very large portion of the articles themselves at Athens, having carefully examined the field of the operations at Mycenæ, and made a close comparison between Dr. Schliemann's labours at that place as well as Troy, he might, at least, add his testimony to that of others as to the great historical value and interest of the find and the enormous age of the treasure, exhibited more prominently in the condition of the articles of silver. There was a great deal yet to be learned of the Cyclopean cities of Greece, Asia Minor, and Italy, and it was remarkable that in the Trojan district a Cyclopean city of greater size and of the highest antiquity had attracted little or no notice in

* Abstract of a paper read by Dr. Phéné before the British Association on the 21st inst.

either ancient or modern times, that of Chigri, although many points about it answered the description of the locality of the Trojan city. In visiting the Island of Samothrace, as to the ascent of which, he believed, he was the only Englishman, at least of modern times, by whom it had been accomplished, he found a Cyclopean city larger than any he had seen on the mainland of Greece. The position of this large city of which we had neither record nor history, in an island most difficult of access, and having neither harbour nor anchorage, awoke questions of thrilling interest, especially as it was on the island on which the darkest rites of mystery, those of the Cabiri, were practised. With our present limited knowledge it was difficult to identify exactly the people who constructed these works, but that they came from the mainland, westward, into Greece, there was a general opinion; if so, Samothrace would probably have been occupied before the Peloponnesus, and this city would be a good deal older than Tiryns or Mycenæ.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRIGHTON.—A discovery has been made at Preston, the northern suburb of Brighton, of the remains of a Roman villa. These were brought to light during the progress of excavations for building purposes, and were found at a depth of between two and three feet from the surface. They consist principally of a quantity of mosaic pavement, several large portions of which have been preserved intact, many fragments of pottery, of good workmanship, and a number of bronze and copper coins not yet classified. A small vase of reddish colour was found unbroken. The excavations are being proceeded with very carefully, and as they are not finished the area occupied by the place is not yet determined. The foundations of the walls already laid bare show that it was of considerable extent; the walls themselves, which are composed of flints and mortar, are painted in various colours, which have been preserved in all their brightness. Some months ago, whilst similar works were going on within about 50 yards of the site in question, a bronze coin, circa A.D. 160, was picked up, and it is hoped that, as the present works proceed, further relics will be unearthed. The site is within a mile or two of a well-known Roman fortified place (Hollingbury Camp), one of the circle of camps formed to guard the harbour of Portus Adurni, now known as Aldrington. Remains of a less extensive character, including cinerary urns, eosus, &c., have previously been found in the district.

CHIPS.

The Duke of Buccleuch has just had completed a series of works for the protection from further decay of the picturesque ruins of Piel Castle, which occupy part of a small island at the entrance of Barrow-in-Furness Harbour. The main circular staircase to the ramparts has been reconstructed, and so much of the battlements replaced as to give the visitor an idea of what the castle originally was.

The Local Board of Health for Willesden, N.W., has referred to a special committee to consider and report as to whether it is desirable or otherwise to take steps for the erection of permanent offices for the Board.

The English architect who is to superintend the fitting up of the British Section of the Exhibition has arrived in Paris, and the work is shortly to be commenced, as the building will be sufficiently advanced for that purpose by the 15th of September.

The foundation stone of a new Baptist chapel was laid at Normanton on Monday. The style of the building will be Classic, and it will accommodate 600 people, at a cost of £3,000. Mr. J. P. Kay, of Leeds, is the architect.

A new chapel of ease is about to be erected at the village of Littlethorpe, near Ripon. It will be of brick, with stone and moulded brick dressings, and roofed with red Staffordshire tiles, and consists of nave, chancel, vestry, and organ chamber, and is from designs by R. H. Brodrick, architect, of Ripon.

The restoration of St. Mary's Parish Church, Woodstock, is progressing rapidly in the hands of Mr. Groves, builder, of Milton-under-Wychwood. The work is being carried out from plans by Mr. Arthur Blomfield, M.A., of London, and will involve an outlay of £5,000.

"BUILDING NEWS" CLUB DESIGNS FOR SMALL VILLA—COTTAGES AT COLINTON—NEW SALT WATER BATHS AT SOUTHPORT—SEA-SIDE RESIDENCE AT OSTEND, FOR THE KING OF THE BELGIANS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SOUTHPORT SALT-WATER BATHS.

THESE buildings, of which we give an illustration, have been erected by the Southport Baths Company, Limited, on the site of the late Victoria Baths Promenade. They are faced externally with Burnley pierpoints, and Longridge stone dressings, and the walls internally are plastered. The principals of the large roofs are of cast iron, each in two pieces. The first-class swimming and private baths are lined with glazed tiles with ornamentation border, the bottoms being laid with glazed bricks, and the second-class swimming baths are lined with glazed bricks with glazed brick bottom. The water in these swimming baths is warmed by means of a copper steam pipe laid in a trench down the centre, and covered with perforated stone. The whole of the baths, dressing-boxes, and corridors, are warmed by means of steam pipes. The first-class private baths, in addition to the salt-water, are supplied with hot and cold fresh water laid on from the Water Companies' main, and the rain-water, from a considerable portion of the roofing, is utilised, being collected in underground tanks, and pumped into the supply tanks by a steam donkey pump. The first class private baths comprise hot, cold, shower, rain, douche, slipper, medicated, vapour, hot-air, and every description of hydropathic baths. The salt-water required is pumped from the sea through cast-iron pipes 9in. diameter, laid on the shore, down to low-water spring tides, a distance of 1,480 yards from the pumps, so ensuring a constant supply of water, except for a short period at extreme low-water spring tides. At the end of the pipes a cast iron cylinder, 6ft. diameter and 6ft. deep, is fixed. Inside this cylinder there is another 18in. diameter, and of the same depth as the outer one. In the small cylinder is fixed an india-rubber foot valve, resting on a cast iron grating. The space between the two cylinders is filled with stones and gravel. The outer cylinder is open at the top, whilst the inner one is closed, but has perforations in the lower parts of its circumference. Provision has been made for increasing the height of the strainer should the sand accumulate round it, by bolting an additional cylinder on to the top. The suction pipe from the pumps communicates only with the inner cylinder above the valve, the water thus passes through the stones and gravel between the cylinders, and rises in the inner one before entering the pipes. By this means a considerable portion of the sand is removed from the water before reaching the pumps, thus diminishing the wear and tear of the working barrels. A sluice valve is also provided, by closing which the suction pipe is kept full while the cylinder is being cleaned, and by removing the india-rubber valve, and then opening the sluice valve, the filtering materials can be washed by the water flowing out of the suction pipe. The suction pipe is carried from the shore through a culvert under

the esplanade, and thence into the buildings, where it is laid on the floor of the pipe corridor, the walls of the principal corridor having been carried down to a great depth for this purpose, thus rendering the pipes easily accessible in case of repairs. The pumps are placed in a dry well sunk under the engine-room, which, with the boiler-house and laundry, is placed so as to be accessible from the back streets for the convenience of getting in coals, &c. The pumps are four in number, two being of the bucket and plunger type, and two having plungers only. The total quantity of water contained in the swimming baths is nearly 230,000 gallons. There is upwards of 1,500 yards of cast-iron pipes of various sizes, from 9in. to 3in., in the building, exclusive of those on shore. The cost of the buildings, including engineers' work, was about £24,000. Messrs. Horton and Bridgford, of Manchester, are the architects; and Mr. C. H. Belve, engineer, of Liverpool, was intrusted with the machinery and hydraulic arrangements. The contractors for the building were the late firm of Swindells and Little, of Manchester. Mr. J. Clayton, of Preston, supplied the engines, boilers, tanks, &c.; Messrs. J. Varley and Co., of St. Helen's, the 9in. pipes; and the pipe-laying and culvert was done by Messrs. Fawkes and Yeland.

COTTAGES AT COLINTON.

THESE cottages have been erected at Colinton, near Edinburgh; each contains 2 public rooms, and 5 bedrooms, kitchen, scullery, wash-house, &c. The roofs are covered with Broseley tiles, the view over the surrounding country being particularly good. Galleries have been constructed on the gables under the projecting parts of the roof. The total cost of the two houses, including boundary walls, &c., is £2,500. Mr. R. Anderson, of Edinburgh, is the architect.

"BUILDING NEWS" DESIGNING CLUB—DESIGN FOR SMALL VILLA.

THIS week we give a double-page sheet of designs submitted to us in the above competition. It will be seen the selection we give comprises six of the best designs, numbered in the order of their merit, as we have placed them. "Mechlin," it will be noticed, has one of the most compact arrangements as regards area covered, though "St. Lucy" has, in some points, a more economical arrangement of interior, and provides a serving door between dining-room and kitchen. The fault of "Hampton" is, perhaps, chiefly the numerous breaks on the entrance side. It will be noticed that the cubic contents of each design is given, also the dimensions and scales to each, and we refer our readers for further remarks on these designs to our review of the competition, page 113. On the whole, it may be said that the designs received displayed a considerable amount of talent, and many of them are remarkably suggestive.

ROYAL MARINE RESIDENCE AT OSTEND.

WE give to-day further details of the seaside residence recently erected at Ostend for the King of the Belgians; a description appeared, together with five pages of illustrations, last week.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

WE have had forwarded to us a printed statement issued under the auspices of the above Society pleading for the preservation of ancient buildings, and their protection from what is called "restoration," and as we are asked to publish it we here quote the main portions of the address. Speaking of the last fifty years of archaeological progress, the committee, which comprise the names of some of our distinguished artists and dilettanti, say:—"We think that those last fifty years of knowledge and attention have done more for their destruction than all the foregoing centuries of revolution, violence, and contempt. For architecture, long decaying, died out, as a popular art at least, just as a knowledge of mediæval art was born. So that the civilised world of the nineteenth century has no

style of its own amidst its wide knowledge of the styles of other centuries. From this lack and this gain arose in men's minds the strange idea of the restoration of ancient buildings; a strange and a most fatal idea, which by its very name implies that it is possible to strip from a building this, that, and the other part of its history—of its life that is—and then to stay the hand at some arbitrary point, and leave it still historical, living, and even as it once was. In earlier times this kind of forgery was impossible, because knowledge failed the builders, or perhaps because instinct held them back. If repairs were needed, if ambition or piety pricked on to change, that change was of necessity wrought in the unmistakable fashion of the time: a church of the eleventh century might be added to or altered in the twelfth, thirteenth, fourteenth, fifteenth, sixteenth, or even seventeenth and eighteenth centuries; but every change, whatever history it destroyed, left history in the gap, and was alive with the spirits of the deeds done amidst its fashioning. The result of all this was often a building in which the many changes, though harsh and visible enough, were by their very contrast interesting and instructive, and could by no possibility mislead. But those who make the changes wrought in our day under the name of restoration, while professing to bring back a building to the best time of its history, have no guide but each his own individual whim to point out to them what is admirable and what contemptible; while the very nature of their task compels them to destroy something, and to supply the gap by imagining what the earlier builders should or might have done. Moreover, in the course of this double process of destruction and addition the whole surface of the building is necessarily tampered with; so that the appearance of antiquity is taken away from such old parts of the fabric as are left, and there is no laying to rest in the spectator the suspicion of what may have been lost; and, in short, a feeble and lifeless forgery is the final result of all the wasted labour. If it be asked us to specify what kind or amount of art, style, or other interest in a building, makes it worth protecting, we answer, anything which can be looked on as artistic, picturesque, historical, antique, or substantial; any work, in short, over which educated artistic people would think it worth while to argue at all. It is for all these buildings, therefore, of all times and styles, that we plead, and call upon those who have to deal with them, to put Protection in the place of Restoration, to stave off decay by daily care, to prop a perilous wall or mend a leaky roof by such means as are obviously meant for support or covering, and show no pretence of other art, and otherwise to resist all tampering with either the fabric or ornament of the building as it stands; if it has become inconvenient for its present use, to raise another building rather than alter or enlarge the old one; in fine, to treat our ancient buildings as monuments of a bygone art, created by bygone manners, that modern art cannot meddle with without destroying. Thus, and thus only, shall we escape the reproach of our learning being turned into a snare to us; thus, and thus only, can we protect our ancient buildings, and hand them down instructive and venerable to those that come after us."

While we fully sympathise with the efforts of this society to preserve and protect from spoliation and unnecessary renovation our ancient buildings, and while we also think many of our restorations have gone beyond the actual demands of the case, we cannot admit the principle the Society lays down of "staving off decay" by means unworthy of the age, such as "to prop a perilous wall" or patch a leaky roof, nor can we see the logical force of the suggestion which allows every century but the 19th century to add and alter. Such a doctrine is tantamount to the admission that the art we profess is unworthy of our age and of ourselves, that all our study of the past is worthless compared with that of our predecessors, and that really we have no history of our own to record. The result of this "leave alone" principle would be that in a few years the remains of ancient art would entirely disappear.

A CHAPTER ON POSTS AND SHORES.

WHILE discoursing of modern woodwork, wherein fir has become the chief material, it may be pardonable to note the difference of "fir" and "deal;" since, when express terms exist for varied conditions of a substance, their indiscriminate use jars on the technical ear, and reveals a slight acquaintance with the subject. When the ox or the sheep has been converted into meat we dare not reject the distinctive word. Transitions are not, indeed, always attended with a change of name; and lamb remains lamb though turned into food. So, whether as a tree in the soil, or timber in a building, one word serves for fir—*aut arboris aut materiae*. New names often impart a new value, as the Dutch proved to us centuries ago, when they cut dull, unfigured, mediocre Rhenish oak into boards, and exported them under a name commemorating the place of operation. By this combination of mechanical skill and commercial adroitness, wainscot was endowed with the charm and wonder of a great discovery; and a widespread fashion for panelled walls and ceilings was created, to the prejudice of textile hangings, previously in favour. So anxious were architects to secure the correct sort, that "right wainscot" was long an item in their specifications.

A similar change took place elsewhere. Towards the centre of the great timber-bearing peninsula of Norway and Sweden, not far from that sixty-fourth degree of latitude, at which the zone of sylvan luxuriance is supposed to terminate, arises the river Dal, or rather the system of which East Dal and West Dal are the principal streams. In a course of more than 300 miles it traverses the entire breadth of Sweden, and connects the western border of Norway with the Gulf of Bothnia, southward of the port of Gefle. Like the Gotha at Trolhatta (which reminded Mr. John Barrow of the Rhine at Schaffhausen) the Dal has its precipitous descents. "We walked," says Mr. Horace Marryatt, "by the Dal river to the falls, which come tumbling over from the Fern Sö lake, glorious in the abundance of water." The exact and philosophic observer, Dr. Clarke, thought the Dal superior to the Gotha. "Close to the principal cataract," he says, "stood a sawing-mill, worked by an overshot wheel, so situated as to be kept in motion by a stream of water, diverted from its channel for this purpose. The remarkable situation of the sawing-mills, by the different cataracts, both in Sweden and Norway, are among the most extraordinary sights a traveller meets with. The mill here was as wide and as picturesque an object as it is possible to imagine. It was built of the unplanned trunks of large fir trees, as if brought down and heaped together by the force of the river. The saws are fixed in sets, parallel to each other, the spaces between them in each set being adapted to the intended thickness for the planks. A whole tree is thus divided into planks by a simultaneous operation, in the same time that a single plank would be cut by one of the saws." These mills, then, receive "fir" and give out "deal;" the matter it has been my endeavour to trace home. The word that originally signified a mere step in the process of conversion has become gradually confused with the nature of the wood, but by no means denotes a separate species. As well might the collateral term "balk," used where trees are simply hewn into square logs, be held to mean a special kind; it has no such pretension; but the laws of Sweden are classified into balks, and the name has attached to timber exported under fiscal rules; just as it is said to be "bracked" at Memel and other ports on the east side of the Baltic. Balk serves the carpenter for skeleton, or naked framework; and deal, because of its preparation, and more careful conveyance, is applicable to the finishings and fittings, in which joinery consists. Original distinction there is none; and but for the incident of the mill, the carpenter and the joiner, in their respective departments, might be consuming the substance of a single tree. The mills of the Dal, and other districts of Sweden, to which attention is confined, constitute, however, in spite of their rude simplicity, a really grand and powerful agency, supplying to this country alone from 3,000,000 to 4,000,000 deals per annum, beside an immense quantity of prepared flooring.

Posts.

Posts are upright supports or pillars, serving the office of columns, for sustaining the upper parts of buildings; and are themselves subject to compression. The best form is that presented by nature, in the round tree, because the substance is symmetrically arranged about the axis; but practically we have to do with material of foreign growth, squared before imported; and, partly at least, from this commercial circumstance, the cylinder commonly gives place to rectangular figures. A square pillar, however, has great stability of form, and suits a vertical position.

Under a pressure of about 4,000lb. (or less according to Mr. Laslett) on the square inch, fir is shortened, expanded, split, and burst. It would safely bear 1,000lb. per inch; but conditions of flexure soon supersede the question of crushing, and tend to complicate the simple

FIG. 3.

FIG. 4.

inquiry; for no task could well seem more elementary than that of fixing the size of posts; yet the tendency to bend governs, and keeps within very close limitations their applicability (whatever the sectional figure) as efficient vertical supports.

When it had been discovered that the power of a level beam increased with the square of the depth, it must have been seen that other rectilinear sections, obtainable from a given round tree, were stronger than the square though of smaller area. A parallelogram, having for its least side one-half of a pentagon, was for a time accepted; but further investigation substituted a face of the hexagon as the breadth of the strongest obtainable beam from a given tree. But, discarding that maximum relation, the same strength is reached, with a further saving of wood, as shown in the table of joists.

Whether stress be exerted upon a horizontal girder, or upon an upright post, flexure ensues. It is generated in different ways, and with some variation of form, but is a common property, making the two cases less dissimilar than they at first appear. A cross-strain causes bending in the direction of that strain; compression at the ends acts upon the diagonal. But inasmuch as a thin board from the middle of a tree would have the same diagonal as the largest obtainable scantling, the only reliable measure of strength in a part is the area of its base, and, in a figure, yielding support to the axis with tolerable equability. The sectional area, or base of a post, may be found by the following rule:—Multiply the pounds in the load by the decimal .002; and the square root of the product multiplied by the height in feet gives the area in inches. Let it be required, for example, to sustain a weight of 20,000lb. at a height of 20ft. $20,000 \times .002 = 40 \sqrt{6.3 \times 20} = 126$, which is the number of inches in the base or section of the post. A few other results with the same weight are set down, and it will be seen that they are in direct proportion to the height—if one be doubled so is the other; but every change of load requires a fresh calculation.

WEIGHT TO BE SUPPORTED, 20,000lb.

Height in feet.	Area in Inches.	Diameter of Circular Post.	Side of Square Post.	Rectangle.	Effective Power per sq. in. in lb.
10	63	9	8	10 × 6½	320
15	94½	11	9½	12½ × 7½	212
20	126	12½	11¼	14 × 9	160
25	157½	14	12½	16½ × 9½	128
30	189	15½	13¾	17½ × 11	107

Were the column of effective power here tentatively introduced, confirmed by experiment as above suggested, it would be of great value, because applicable to every height and every load.

The resistance of fir to crushing, by pressure on the side, is so nearly equal to that at the ends that sills and bressummers are not injured by posts of proper size charged with appropriate loads.

The form in which timber is imported, and the mechanical methods of conversion, make right-lined sections economical and convenient. In the annexed diagrams the cylinder is supposed to be 10in. diameter, and the area 78in. Inscribed square, 50in. Rectangle on pentagon base, 48. Ditto hexagon, 44. Heptagon, 40. Octagon, 37. (See Figs. 1 and 2.)

It appears so desirable that the behaviour of posts with these several bases under compression should be generally known, and the question seems capable of determination by modern apparatus with so much facility and precision as to induce the wish that some scientific body may institute an experimental inquiry on the subject. It might well, indeed, embrace and exemplify, on a reliable scale, all strains by which a material of such universal application in building as fir timber is ordinarily affected, and whose economic use is a point of general concern. When structures fail the consequences are often calamitous, and the lesson they teach is that, instead of regarding tabulated data as ample, due addition should be made to compensate for incisions in the process of framing; and with the strongest propriety as regards posts partly in the earth, or otherwise in unfavourable situations, against the agencies of decay.

Piles are distinguishable from posts principally by their association with underworks and preparations rather than with superstructures, and they claim little attention from the carpenter; but it is worthy of remark that, for this subsidiary purpose, a tree of the lowest general estimation is pre-eminently fitted. Dr. Horman, whose English is less easily deciphered now, perhaps, than before the Reformation, says:—"A quavery or mares and unstable foundacys must be holpe with great pyles of alder, ramed downe with a frame of tymbre called a crossandre;" and every writer, from Vitruvius downwards, pays the tribute of re-

cognition to the merits of alder, when wholly in the earth or wholly under water. If merely damp it rots away; if dry it is soon devoured by worms. Most of the fabrics of marshy Ravenna and the Rialto at Venice are based on piles of alder. Though soft, and in many ways so inferior to the oak, it is equal in toughness, and thus able to bear the percussive shock of the driving ram.

SHORES.

Shores are timbers used as props or temporary buttresses, for preventing injury to structures that are sound, or supporting such as are unsafe. The typical form is the oblique strut, called a "raking shore." Like the story post, it is in a state of compression, but, instead of acting as an erect bearer, it exerts a lateral thrust. It would do so with most powerful effect if set at an angle of about 40° with the horizon, but under the exigencies of fact the spread at the base is generally much less than would then be the case. The timber is often raised to an angle of 60°, or even 70°, at which last the height is upwards of 2½ times as great as the spread of the foot, while hardly one-fifth of the force takes a horizontal direction. The operator, therefore, in fixing the scantling must consider, not only the weight of the work to be supported, but the loss of power due to the ineffective direction. (See Fig. 3.)

The length, section, and slope of a shore being determined, an abutment is prepared at the top by an upright plank against the structure to be sustained. Through the plank is passed a strong stud that forms a projecting shoulder in front, and by penetrating the structure keeps the plank from sliding upwards. The head of the shore is then adapted, and the timber driven up with the required force by means of wedges comprised in the foundation of planking at the ground level. Care is to be observed that the foot of the shore has a perfect and uniform bearing, so as to avoid the leverage and wasteful strain that ensues when the pressure is uneven. It may be pointed out that, when a timber is compressed at the ends, its ability to resist a cross strain is impaired, and that consequently one shore should not be made a support for a second, as may too frequently be seen, but each should have its proper footing on the ground. The mechanics of shoring may be shortly stated with the help of Fig. 4. If a sloping timber, A, rest on the ground at the foot, and against a wall at the top, it will exert three forces. Were there no impediments it would descend in a vertical line, D, but, being prevented, it tends to slide along the ground, B, and, checked there, it seeks to overturn the wall, C. The pressure on the shore being uniform, the centre of gravity is at the middle of the length, and the several strains may be thus estimated. If a vertical line be drawn through the centre of gravity from the ground to the height of the shore, and that line be taken as the scale of the vertical pressure, the horizontal distance from the centre of gravity to the foot of the shore will be the proportionate measure of the lateral thrust against the wall at the top and the sliding force on the ground. Then an inclined line from the top of the vertical ordinate to the foot of the shore will have a medium direction between the two forces acting on the ground, and the foundation should be made at right angles to that line, and not to the actual direction of the shore. It illustrates in a simple way the process known as the "composition of forces," with which the artist in carpentry should be familiar.

THOMAS MORRIS.

NEW BOARD SCHOOLS AT PLYMOUTH.

[COMMUNICATED.]

SOME few months since the School Board for this town expressed dissatisfaction with their architects, Messrs. Norman and Hine, who were also the architects for the Town-hall and municipal offices, and ultimately resolved that for the next schools required they would resort to that panacea for such troubles—a competition. The board decided to offer no premiums, and seeing that without such inducements 33 architects have been willing to send in designs, probably they were little to blame for not spending the ratepayers' money.

The site is oblong, not quite a parallelogram, in round figures about 210ft. by 60ft.; the ground falls very sharply in the direction of the length. The accommodation required was for 250 infants and 300 girls, but provision was to be made for building half of the girls' school first—i.e., sufficient for 150. A curious rule seems to have been made excluding perspectives; probably the Board felt their education too "average" to comprehend such mysterious productions. Colour was not forbidden, although it seems to have proved a snarl where it has been used on the general drawings. The drawings sent in certainly show a great variety of ideas for dealing with the site; a majority of the competitors show the whole arranged on one floor, and amongst these again is a diversity as to the best mode of overcoming the difficulty of the sloping ground—some have stepped the buildings down, others have shown a basement triangular in elevation and very lofty at one end; some of these have utilised the basement as a covered playground, but in others it is not utilised at all. Several designers have separated the infants' and girls' schools, making two distinct blocks. Of course the one-story designs take up much more space, and further show in an aggravated form the difficulties of the sloping site. The favourite style appears to be Gothic, modified to suit the Board's pockets and requirements, though a very few are *outré* ecclesiastical; traceried windows and elaborate detail generally seem very unsuited to Board schools. One or two have tried a dwelling-house or warehouse style, but without success; a few others show a slightly Elizabethan character, and some, again, Queen Anne, who, though dead, yet speaketh. The drawings, stated to number about 200, make a very fair show. The estimates are very wild, ranging from £2,000 to £7,000 odd, and as is usual in such cases, there does not appear to be any reason for supposing that the ones to which the lower estimates are affixed can be built for less money than those concerning which their authors appear so apprehensive of great cost. The drawings most worthy of notice are those under mottoes—"Advance," "F. R. J.," "Utilitas," "Fodina," "Spero (B)," "Quis." "Advance" shows a very well finished set of drawings. Several alternative blocks are shown, and a ground plan for a one-story building—the complete design is in two stories. The buildings are exceedingly compact, and planned with an evident knowledge of the great ultimate value of all land in a town like Plymouth. The windows are square-headed, with stone mullions and transoms. Some very able details are shown, and although absolutely devoid of ornamentation it is probable the effect would be better than that of most of the other designs in the room. The estimate attached is £4,200. "F. R. J." also shows a well-finished set of drawings. These buildings are also in two stories. A covered playground for infants is shown, and a covered approach to the w.-c.'s. A residence for the school-keeper is attached. The details show that this is the work of an accomplished architect. The style is eminently utilitarian, but withal a modicum of picturesque effect has been attained; the small angle turrets show a little Stuart feeling. An open-timber gallery in one gable seems rather useless. The estimated cost is £5,000 for the whole, or £3,500 for the partial scheme. "Utilitas" show a well-finished set of drawings. A covered playground in the basement is cleverly managed—the arcade supporting the front wall comes out very well. The style is Pointed, and is coloured for brick-work with tiled roofs. This choice of material will probably somewhat injure the author's chance, as Plymouthians like their limestone to show, unless they have stucco fronts. The estimated cost is £3,500 for the complete scheme, and £2,600 for the partial one. It may be here observed that this design would certainly cost more to execute than "Advance," the estimates notwithstanding. "Fodina," a neat and economical plan well deserving of consideration. The buildings are in two stories. The elevations are fair, excepting the straw-like mullions to the large windows—a fault, by the bye, not peculiar to this architect. The estimate is £3,050, £2,230 for the partial scheme. "Spero" (B), two plans are shown,

one is very good. The infants' wing is in one story, the girls are in two stories, the upper story being intended to accommodate the seniors. The drawings are very good, the details sensible, and well finished. The estimates are £3,500 and £2,600 respectively. "Quis," a very good compact plan. The two-storied part has been placed on the highest ground, and the whole effect is exceedingly picturesque. The estimates are respectively £4,675 and £4,000. Of other designs which it would be unfair to class together, may be noted: "To Be or Not to Be," "Spero," "H. B.," "Playground," "Auxilium ab Alto," "Intersecting triangles in circle," "Perseverance," "Experientia," "Fidelitas," "Eddystone."

THE NOTTINGHAM CHURCH CEMETERY COMPETITION.

THE proceedings at the annual meeting of the Nottingham Church Cemetery Company last week were enlivened by some smart passages at arms and controversies, resulting out of the recent competition for a cemetery chapel. The directors' report stated that, in reply to advertisements in the Nottingham papers only, plans and drawings were received from nine competing architects, and those of Messrs. Clarke and Son, of Nottingham, were selected in February last as excelling "all others in amount of accommodation provided, purity of style, and generally in architectural character and beauty; but at the same time a greater latitude with respect to cost had been taken by them than by the other architects—Messrs. Clarke and Son's plan being estimated to cost £3,000." The report passed on to speak of an agitation raised against the acceptance of the plans, on the ground that the chapel need not cost more than £2,000, but resulted in the calling of a special meeting, whereat resolutions were passed annulling the directors' decision, and appointing a committee of nine shareholders to act with the directors, with powers to obtain designs for a mortuary chapel, not to exceed £2,000 in cost. Messrs. Clarke and Son declined to compete again, but all the previously unsuccessful competitors again sent in plans, and, says the report, "one of them who had been most forward in the agitation in opposition to the former selection, sent in no less than four different sets of designs for competition, under four different mottoes." The 39 designs were submitted to Mr. C. Hodgson Fowler, architect, of Durham, who placed three as first, second, and third, and commended two others. All five designs proved to be by London architects. The shareholders' committee finally adopted those of Mr. E. W. Godwin, F.S.A., of Victoria Chambers, S.W., which had been placed first in order of merit by Mr. Hodgson Fowler, who considered it carefully designed within the sum stipulated in the conditions. Since the selection of Mr. Godwin's design the directors had received a protest from Mr. Frederick Jackson, of Nottingham, one of the unsuccessful competitors; against all three premiated designs, on the ground that the spires were of wood, not stone as required; there were no provisions for heating, all largely exceeded the proposed cost, and were too much cut up for a Church of England cemetery. The directors, while holding that the decision of the last meeting was binding on the company, contended that the entire responsibility of the present selection of a design rested with the shareholders' committee. Mr. Allen said no one could doubt that in the first competition Messrs. Clarke and Son's design was the best, but as it could not be carried out for "£2,000 or thereabout," as the advertisement stipulated, it would have been morally wrong to have adopted it, however beautiful. If the present design (Mr. Godwin's) could not be carried out for £2,000, it should not be used at all. Mr. Jackson complained that his letter, which was a private document, merely written for the purpose of advising the directors, should have been given publicity. After a long discussion the directors' report was carried, but in the stead of the chairman and two other gentlemen on the board, three other shareholders were elected as directors, one of the retiring directors being elected to fill vacancy.

CHURCH ARCHITECTURE IN PORTUGAL.*

TO one who comes from Spain to Portugal a great falling off is observable in church architecture as in many other respects. The elements of grandeur and nobleness are exchanged for those of neatness and prettiness. Thus, instead of the rugged granite churches of Galicia, churches are seen across the frontier in the Portuguese province of Minho-Douro, built, indeed, of the same material, but dabbled over with plaster and whitewash, with the granite showing only in the mouldings, string-courses, and pilasters—a most unpleasant and unpicturesque admixture of colours. Greatly as the Spanish churches have suffered at the hands of the builders and carpenters of the Renaissance and later periods, this is even still more the case in Portugal, where the aversion to ancient and original work seems to have amounted to a positive mania. In addition to this, the cathedrals of Portugal are on a much smaller scale than those of Spain, and the rich overlaid Renaissance, which is tolerable in such a vast pile as the Cathedral of Santiago de Compostella, becomes simply contemptible in the smaller churches of Vianna, Braga, or Oporto. Though, however, the work of the Renaissance and later styles in Portugal is overloaded with ornament, and contrary to the principles of true art, yet of its kind, inferior though that kind be, the work is excellent. The Portuguese have a peculiar talent for carving figures in a life-like manner in wood, and, to a certain extent, also in stone. The principal church in the town of Vianna, at the mouth of the beautiful river Lima, has over the front a piece of sculpture of earlier date than is common—probably of the earlier part of the sixteenth century—which struck me as of unusual merit. The subject is the Baptism of Christ. The Saviour stands in the water, girt with a cloth around His loins, and St. John Baptist—a most admirable and life-like figure—pours water on His head from a shell. Two chubby, fair-haired angels stand by, holding a cloak for use when the ceremony is over. The city of Braga—whose Archbishop disputes with his brother of Toledo the primacy of all the Spains—contains a good deal to interest the ecclesiologist, although but very little early work has been spared by the destroyers of the Renaissance. In the *Sè*, or Cathedral, the ancient round-arched doors at the west and south have been spared, and that is all. Inside, the genius of the Renaissance has run riot, and has either destroyed or covered over all the old work. Nowhere is the essential Paganism of the Renaissance more clearly exhibited than here. Thus the gorgeous, gilded organs of the *Alto Coro* are supported by huge hairy satyrs, horned and hoofed, and the *azulejos* which line the approach to the same choir represent hunting and other sporting scenes, Juno with her peacock, and a lot of languishing Cupids. The “Alto Coro” itself, which is dated A.D. 1622, is of extraordinary richness, while the choir proper is almost beggarly in its fittings. These “Alto Coros,” which occupy the western galleries of so many Spanish and Portuguese churches, are at once in bad taste and destructive of decent ritual. I saw here the “Breviarium Bracharense” of Archbishop Ruderic Demousa Telles, printed at Braga in 1724, and a fine black letter “Missale Bracharense” (Lugduni, 1558). By this it appears that, like Sarum and Hereford, Braga had its own “use.” In a chapel to the north of the *Sè* is the fine altar-tomb of Archbishop Gonçala, A.D. 1348, which bears a colossal recumbent effigy of that prelate. An inscription, added in 1789, is curious. In the church of St. John, in a chapel with a groined roof, under the tower, is a curious “retable,” or reredos, and a “Pietà” carved in stone, with the coloured figures as large as life. In the church of St. Francisco are a series of fine “azulejo” paintings. I much regretted that the continued water-spouts of rain prevented me from visiting the pilgrimage hill of Bom Jesus, which rises above Braga. In its numerous chapels are represented the Ascension, Resurrection, &c., and the life-size figures of the various groups are said to be of most admirable execution. After all, the prominent characteristic of Portuguese

architecture is the universal and profuse employment of “azulejo” tiles, which in some instances give a very Arabian aspect to the buildings thus decorated. The entire fronts of many houses are frequently covered with them, and they are used in no less profusion in the interior of the churches, and this often with very good effect. In the latter case not only tiles with conventional patterns are employed, but a number together make up a scriptural or historical scene. Where not to use them is ludicrously exemplified in the Cathedral of Oporto. This much maltreated church possesses singularly beautiful cloisters in the First Pointed style. The material is grey granite, but the ambulatories have been lined, in most painful contrast, with blue-and-white tiles illustrating in the funniest manner the Song of Solomon. The bridegroom appears as a handsome young shepherd with wallet and crook, while the bride is represented as a stout, languishing lady, like one of Lely’s pictures of a court beauty in the time of Dutch William. In Galicia, and since in Portugal, I found the villages everywhere adorned with small erections whose use I found it difficult to conjecture. They are small buildings of an oblong form, constructed of granite with a sloping stone roof, numerous narrow windows at the sides, and a door at one end. They stand upon four or more granite pillars, and have a cross upon one gable and a pinnacle on the other. They resemble small chapels or coped tombs. On inquiry I found that these simple but picturesque buildings are used for the storing away of maize.

CHIPS.

A public park was opened at Limerick, on Monday, by the Mayor and Corporation of that city.

A drinking fountain is to be erected on the green at Shipton-under-Wychwood, as a memorial of the 14 emigrants to New Zealand from the village, who lost their lives by the burning of the *Cospatrik*.

The Great Yarmouth School Board opened, on Thursday week, a new school on St. Peter’s Plain, erected from plans by Mr. J. T. Bootle, their architect.—Foundations are being excavated for a new Military Depot to the west of the Marine-parade; and a new light line of railway between Yarmouth, Caister, and Ormesby, has just been opened for traffic.

The recently constructed Urban Sanitary Authority, of East Dereham, Norfolk, have appointed Mr. Nankerville as their surveyor and inspector of nuisances. It is probable that the board will very shortly take up the question of the desirability of erecting a suite of public buildings for the use of the town.

Various structural and other alterations have just been completed in the buildings in Philadelphia, Heigham-street, Quay-side, and Surrey-road, belonging to the Norwich School Board, by Mr. J. Dorming, Mr. J. W. Lacey, and Mr. James Young, contractors, in accordance with plans by Mr. John H. Browne, architect to the Board.

The Town Council of Brecon are of opinion that the gas company’s charges for lighting the town with gas are too high, and have entered into communication with Messrs. Bayley and Sons (who have successfully lit Winchester and Poole with paraffin), to estimate the cost of public oil lamps for Brecon.

Mr. William Belk, C.E., has been appointed resident engineer to the Hartlepool Port and Harbour Commission, vice Mr. Hawkins, C.E., resigned. Mr. Hawkins retains his connection with the harbour works in the capacity of consulting engineer.

Mr. William Tannoek, artist, has just died at Kilmarnock, at the advanced age of 84 years. Deceased studied at the Royal Academy, London, and won considerable distinction as a portrait-painter. He never, however, attained the celebrity of his elder brother, James, who died about fifteen years ago.

The memorial stones of a new Methodist school were laid at Liverpool on Monday. The building will accommodate 350 children, at a cost of £1,500. Mr. R. Roberts is the architect, and Mr. Lett the builder.

Memorial stones were laid on Saturday, the 18th inst., of a Church of England school, Bugsworth, Derbyshire, in course of erection by Mr. D. Drinkwater, from designs prepared by Mr. J. Lowe, F.I.B.A., Manchester. The building is of plain construction, accommodates 150 children, in accordance with the requirements of the Education Department, at a cost of about £600.

The death is announced, from Edinburgh, of Mr. Alexander Sinclair, the distinguished antiquary and genealogist.

Building Intelligence.

CHELMSFORD.—The council of the Essex Industrial School and Home for Destitute Boys recently received 12 tenders for the erection of new buildings on land opposite Admiral’s-park on the Writtle-road, Chelmsford. The plans have been prepared by Mr. Stock, the county surveyor, and comprise main school building, superintendent’s house, and entrance lodge, and house accommodation for 150 boys. The lowest tender—that of Mr. Parmenter, of Bocking (£10,347)—was accepted for the whole work, but as he has found that he could scarcely complete the work within 12 months as required, Mr. Fincham, of Chelmsford, has undertaken to erect the superintendent’s house for £1,330, Mr. Parmenter’s figure for that portion of the work.

IPSWICH.—A new mission church has been opened at West St. Matthew’s, Ipswich. The style is English, of the 16th century, the half-timber porch at the west end being a special feature. The walls are of red Suffolk bricks, with a range of five buttresses on each side, and bands of yellow bricks at the levels of the heads and sills of the windows, and yellow arches to the three-light windows in the east and west gables, the interior being likewise of red and yellow brick, corresponding with the exterior. The building consists of a nave, 48ft. 6in. long by 25ft. 2in. wide, with a centre aisle, a vestry at the east end, 24ft. 10in. long by 8ft. wide, and a porch at the west end, 5ft. 9in. by 6ft. The height from floor to pitch of roof inside is 11ft., and 24ft. from floor to apex. The seats will accommodate 240 persons. The architect for the building is Mr. E. F. Bishopp. The general contractors are Messrs. J. B. and F. Bennett. The tiles for the roof were supplied and laid by the Broomhall Tile Company.

LIVERPOOL.—On Sunday the new Roman Catholic Church of St. Thomas of Canterbury, Waterloo, Liverpool, was opened. Mr. Edmund Kirby, of Liverpool, is the architect, and the style is Early English. Mr. James Leslie was the builder, and Mr. John Francis the clerk of the works. Internally the principal feature is the use of polished granite of various colours for the columns which divide the nave from the aisles. The altar and reredos, executed by Mr. R. L. Boulton, of Cheltenham, are of alabaster, with Irish and Devonshire marble columns. The cost of the building has been about £4,500.

MARKET HARBOUROUGH.—On Thursday week Cardinal Manning opened a new Roman Catholic Church at Market Harborough. Mr. C. G. Wray, of London, is the architect, and Messrs. Halliday and Cave, of Stamford, the builders, Mr. Haines being the clerk of the works. The edifice consists of a nave, and a Lady Chapel on the east side. The entrance is from the south-west end, and the altar at the north-east. The building is in the flowing English Decorated style, and is built of local face bricks, with Bath-stone dressings. The nave is about 100ft. long, and the church will accommodate 350 persons. On the east side a spire, 90ft. high, with representations of the Evangelists at each corner, is erected over the Lady Chapel. In connection with the church, a commodious school has been erected, to accommodate 80 children, in the same style as the church.

PORTOBELLO.—There will be shortly completed various alterations and additions to St. John’s Roman Catholic Church, Portobello, from plans prepared by Mr. John Biggar, Edinburgh. They consist in taking away the west or front wall, and extending the church westwards by 20ft., so as to give room for about 100 additional seats. The new front is divided into three compartments, having corner and two middle pilasters, with moulded bases and Ionic capitals, with architrave, frieze, cornice, and pediment, surmounted by a plain cross. The new front is entirely built of polished stone from Grange Quarry, Burntisland. In the interior there has been erected a plain semi-circular dome-shaped apse, rising to the height of 19ft. from the floor of the church, with a Lady Chapel to the south, and a similar

space on the north, communicating with the sacristy. At the north-west corner of the church the erection of a spacious baptistry is contemplated, as also at the north-east angle of a commodious sacristy. Exclusive of the cost of these contemplated additions, and of the re-seating of the church, the cost of the work now in hand will be about £900.

RODMERSHAM.—The Parish Church of St. Nicholas, Rodmersham, near Sittingbourne, has been restored under the direction of Messrs. Morris and Stallwood, of Reading, by Mr. Lewis Shrubsole, builder, of Faversham. Very little has been done to the exterior, but inside the nave roof has been opened out, whilst in the chancel the western and eastern walls have been rebuilt and its roof re-cased. The nave and north and south aisles are divided respectively by fine arcades of three bays. The arches have been made good, and a new window placed in the south aisle. The main features of the church are Perpendicular. Decorated, but some interesting examples of earlier and later date remain. In the south wall of the south chancel aisle there is a unique Early English arcade of two bays, supported by carved capitals, and a good piscina (Decorated) has been opened out. The most interesting objects in the building, however, are the exceedingly rich parclose screen and sedilia in the two south bays of the chancel, the preservation of which has been carefully accomplished by Mr. Harry Hems, of Exeter.

WOLBOROUGH.—The old parish church of Wolborough, Devon, has, in the last ten years, been gradually improved. The high pews of all shapes have been replaced by open seats; the very interesting screen has been carefully restored, and the chancel has been re-arranged. Last Sunday the new east window was uncovered. The stonework is an exact copy of the old work, which has become too decayed to have inserted in it valuable glass, and three of the five lights have been filled with very beautiful glass as memorials by Messrs. Clayton and Bell. The subjects are the "Agony in the Garden," the "Crucifixion," the "Entombment," the "Resurrection," Our Lord saying, "Touch me not, for I am not yet ascended," and the "Ascension." The stonework of the window is the gift of the Earl of Devon. The two lights, as yet unfilled with stained glass, will, it is probable, not long remain in their present state.

CHIPS.

Boyle's Patent Self-acting Air-pump Ventilators were awarded the highest prize at the Manchester and Salford Sanitary Associations' International Exhibition of Sanitary Appliances, at present being held at Owen College, Manchester, in conjunction with the annual conference of the British Medical Association.

The purchase of the Beech-grove estate as the site of the Yorkshire College has been completed by the payment of the purchase-money—£13,000. The Archbishop of York has promised to lay the foundation stone on October 23rd.

Tenders for the erection of a new bridge at the Hythe, in place of the one washed away last winter, were considered on Thursday sennight by the Colchester Town Council. An objection was raised to the designs, which showed a solid plate structure, whereas some members of the Town Council suggested that a lattice-girder bridge would be not only stronger and more sightly, but would cost less by one-third. The matter was referred back for reconsideration.

Plans prepared by Mr. Hawkesley for waterworks for Wexford have been approved of by the Town Council of that borough, and will be carried out forthwith.

The first general meeting of the shareholders in the Newport, Pillewenny, and Maindee Building Society was held on Friday evening, when a report was presented, showing that the progress of the society during the twelve months it has been in existence, has been sound and satisfactory; the sum of £1,550 has been advanced on good properties. The tables had been prepared by Mr. Arthur Scratchley, actuary. The directors were thanked for the services gratuitously rendered during the year, and were re-elected.

The Eastbourne Local Board have decided to erect six additional groynes for the protection of the sea front, at a cost of £1,000.

The parish church of Filleigh, near South Molton, has been restored and enlarged from plans by Mr. Clark, of Newmarket.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. Price Twopenny, weekly. Annual Subscription, post-free, Eleven Shillings. This week's number contains articles on The Health of Watering Places, The Recent Epidemic of Scarlatina at Great Massingham, Dr. Ferr on the Laws of Population, The Water Supply of London, Cinchona Bark and Quinine, A Perplexed Local Board, The Report of the Joint Committee on State Medicine, The Water Supply of Plymouth, The Present Position of State Medicine in England, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, The Editor's Table, Gleanings, &c. Price 2d. 3l, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

To OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces. Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—H. B.—J. O. G.—E. G. S.—T. L. P.—T. B.—J. A. S.—T. and E.—G. M.—D. C.—E. H. H.—S. Bros.—M. and S.—G. E. H.—T. D.—J. P. B.

Correspondence.

A MODEL NEW CHEAP HOUSE.

To the Editor of the BUILDING NEWS.

SIR,—If "misfortune makes man acquainted with strange bedfellows," equally certain it is that their necessities sometimes force them to live in queer houses. I wish, Sir, to give to the public (through you) an accurate description of a small house in which I have had the misfortune to live for the last six months—a house not much better nor worse, I believe, than hundreds of similar houses hereabouts. Need I say that they are for the most part masterpieces of the speculating builder of the period?

The house in question is (with many of its fellows) built upon "made" ground—that is to say it stands above what was once an enormous hole, which has been filled in with rotten rubbish, ashes, vegetable garbage, gas refuse, brickbats, old laths and boards, shavings, old shoes, and other abominations, with plenty of the very stiffest clay, but positively no mould.

In digging up the ground at the back in a desperate attempt to form a garden, the stink was something awful as the putrefying mess was disinterred; and, as the house itself stands on just the same stuff, it gave a pretty good idea of the noxious exhalations continually rising up through the gaping chinks of all the ground floors.

At the same time interesting relics of the "British workman" were disinterred, among which were two decayed blouses, any amount of short pipes, and about a dozen of tin beer cans—once, no doubt, the property of some unfortunate publican.

The same cistern that supplies the house also supplies the w.c., and is placed directly over and in communication with the latter. The drains are not properly trapped, nor are the drain pipes laid with joints, sealed with

cement, mortar, or even clay. The sink is in close communication (through the drains) with the sewer, and so the house is constantly pervaded, more or less, but mostly more, with a perfect bouquet of sweaty stinks, only too palpable indications of the presence of sewer gas. Moreover, the mixed-up filth with which the ground was in part "made," is always giving off foul gases, which rise up into the house through countless cracks in all the floors. So much for the site!

In front the house has the usual "tasty" bay window, with its elegant ornamental columns, and a "neat" iron fence set in the stone coping of a dwarf wall; but the front door is built of unseasoned stuff, and the parts are all shrinking and warping away from each other. The mouldings round panels have never been fastened, but just stuck in with putty and a dab of paint, and now, of course, are dropping out. The door is flimsy and shaky, with a paltry latch; but, of course, has two panels of figured glass.

The floor of the "hall" is full of chinks and ridges, that can be plainly felt when walking over the floorcloth, and the ceiling is full of cracks; so are all the ceilings. In the front parlour the floor is equally bad, and would soon cut the stoutest Brussels to pieces; the door of the room is warped, split, and cracked; the sashes are paltry, and the Venetian blinds warped all out of shape. They don't work at all well, and when let down do not exclude a view of the interior from outside. The folding doors leading to back room are very bad, and there are two great cracks in the panels through which one can both hear and see plainly, while the bolt and latch are simply worthless (but yet quite new!), and fastened on with odd screws.

In the back room the floor is shrunk and ridgy, and a carpet cannot be put down because the door will not open over it. The room was papered before the walls were dry, and with the usual result.

Under the stairs are two cupboards, one of which is for food, and the door is provided with zinc panels at top—I suppose, to admit air. But as the door nowhere fits its opening by $\frac{1}{2}$ in., and is so hung as to project $\frac{3}{4}$ in. at top, and go inwards $\frac{3}{4}$ in. at the bottom, the cupboard gets plenty of air without the zinc panels, let alone the advantage of admitting the flies. The other cupboard is much the same.

The house has a side door fitted with a glass panel at top to admit daylight; but this is a useless luxury, as we get plenty of daylight through the wretched door itself. The kitchen is perhaps the worst of the lot. The room is low-pitched, the floor is as usual, the ceiling full of cracks, the range very paltry, and the chimney smokes, and, owing to its proximity to the scullery sink, the room is never free from a stink. The joinery is positively shameful, and one door is coming to pieces, all the cupboard doors are out of shape, and they don't fit at all. Locks, latches, and fastenings are alike bad.

The scullery is so bad at times that no servant can possibly stand and work at the sink. The effluvia is deadly.

The handrail and balusters of the stairs are most slovenly done, and the stairs rough. Upstairs the window sashes are paltry, the doors badly made, and coming to pieces, and full of cracks and chinks, and the joinery generally of the most paltry description, and latches and locks the same.

In a word, the entire house from top to bottom, and from back to front, is built by slovenly workmen, of inferior bricks, bad mortar, and paltry materials throughout; and is it uncharitable to say that it has been built so, not inadvertently or by chance, but deliberately, and of set purpose, as part of a nefarious "scheme"—a speculation on the necessities or the ignorance of the public, and with a cynical evasion of all obligations legal or moral?

What cares the speculator (or the idle, worthless, seamping lubber of a workman) that women who stay all day in such foul dens complain of headaches, and always feel tired and ill? What is it to him that children slowly droop and die of blood-poisoning? The men are mostly away in another air all the day, and

Intercommunication.

QUESTIONS.

[5092.]—Mortar Joints.—Rolled Iron Beam.—Will some of my fellow-readers be kind enough to answer the two following questions:—1st. What considerations other than that of appearance ought to govern the thickness of the mortar-joints in brick-work—both the bed-joints and side-joints? 2nd. A rolled-iron beam will carry with safety a central load of three tons; what weight per foot-run will it be safe to put upon it, supposing the span in both cases to be 10ft. ?—STUDENT.

[5093.]—Architectural Tour.—Can any of the numerous readers of your journal oblige us by giving the names of places containing examples of architectural interest around Buckingham, and which are within a day's drive of that town?—TWO BRIGHTON STUDENTS.

[5094.]—Measuring Chimney Breasts, &c.—I shall feel obliged if some correspondent will kindly inform me of the most correct method of measuring chimney breasts and flues' labour only? I let the building of brickwork and masonry (labour only) to a contractor, who agreed to build my flues at 9d. per foot rise; does that include chimney breast, &c., or must I pay for surface brickwork, in addition? If so, how measured? I also agreed to pay per yard for stone blockers, front of buildings, in which there are two large openings for bay windows—7ft. 9in. x 7ft.; do those measure in, or should they be deducted, and pay for plumbing quoins? There is also a rubble wall, in which there are two similar openings for bay windows, and an opening for shop-front, 12ft. x 8ft. I do not wish to be arbitrary, but it does seem to me unreasonable to pay for so many yards that were not built. An answer to this will oblige—ONE WHO DOES NOT KNOW.

[5095.]—French Polishing.—Will some one kindly explain the method of French-polishing, the materials used, and the time required? Also, how soon an article can be used after being French-polished?—ANGLER.

[5096.]—Board Schools.—In providing for a school to accommodate 500 children, what space should be allowed to each child? How must I calculate for sizes of school and class-rooms therefrom? What height should they be? If a mixed school (infants and older children), what difference will it make to calculations? Is there not a book published containing instructions and rules for schools of this class enforced by Government, and where can I obtain the book, if there is one?—PERPLEXED STUDENT.

[5097.]—Ceiling Light.—Will some one kindly show, by sketch or otherwise, the best mode to construct a ceiling light, made to open, and the best way for providing for the exit of water (caused by the breath of persons in the room) that will accumulate and run down the glass of the same?—PERPLEXED STUDENT.

[5098.]—Concrete Parsonages.—Can any reader of the BUILDING NEWS mention where any concrete parsonage houses can be found? Are they successful? If not, why not? What percentage is saved as compared with brick or local stone? Is there any recent standard book on the subject?—J. H. G.

[5099.]—Pitch Pine.—I have allowed first quality pitch pine to be substituted for Memel for the first and second-floor joists of a building of 24ft. clear span. Have I acted unwisely, or is there no fear of the ends sleeping away? Would the danger be lessened by letting a current of air into the cavity?—J. C.

[5100.]—Hollow Walls.—I should be glad to know which is considered the best way of building hollow walls, whether the 4½in. wall should be inside or out, and if inside whether the joists should be taken into 9in. wall, or merely rest on 4½in. wall, having a course of bonders immediately above the joists?—C. F. M.

[5101.]—Chimney Shafts.—Will some correspondent kindly inform me how I can build a chimney shaft of the following dimensions:—100ft. high from the ground, 6ft. diameter inside at the base, 4ft. diameter inside at the top; 1st, 25ft. from the ground, 3 bricks thick; 2nd, 25ft., 2½ bricks thick; 3rd, 25ft., 2 bricks thick; and the last 25ft., 1½ bricks thick, so as to insure it against cracking—a heavy cap in brick in cement on the top of the shaft? I ask for information because I have seen numbers of chimneys, about the size of that specified above, all very much cracked from the cap to about 50ft. down—no cracks below this point. I wish to know the cause of the cracking, and how to prevent it.—E. F. B.

[5102.]—Fair Wear and Tear.—I hold a house under a lease, containing the usual covenant to keep in repair; there is a crack in the brickwork of the back wall. At the expiration of the term could I be obliged to cut out the defective part and make good, or would it come under "fair wear and tear"?—ARTHUR VERNON.

[5103.]—Iron Bridge.—I am about to erect two wrought-iron girder bridges over a small stream running through an estate to be let out for building purposes. The spans of bridges between abutments are to be 30ft. and 40ft. respectively, to be one span, and capable of carrying a life load 2cwt. to the square foot, the roadway to be 20ft. wide in clear of

do not themselves so much feel the bad effects of this knavery. Often, too, they are utterly ignorant of all sanitary matters; and so the women droop and the children die, and the "enterprising" builder pockets his profits, and (in this world at any rate) runs little risk of getting what he so richly deserves.

This house I have tried to describe is no exceptional one. Hundreds like it are already "run up," and hundreds more in process. Right opposite is a big hole (the remainder of our hole) which is being filled in, and the ground being "made," the process consisting of shooting any kind of "muck" into the hole, and as fast as it comes to a level so-called "houses" are pithforked together atop. Surely all this is an evil that legislation already existing can reach?

Some may say "that it is our fault to take such houses. There they are in the open market, and we can take them or leave them." Not so. To many of us it is essential to be near the City, and that fact compels us to a choice; and here in Peckham, out of every hundred of small houses built—perhaps the above description (*mutatis mutandis*) would be not inapt as to ninety of them. It is thus a case of Hobson's choice.

Meat, fish, and other food is exposed for sale in open market, and the public is not forced to buy any particular article. If it is unfit for human food no one compels us to buy it. But here the law sternly protects the public, and comes down heavily on those who expose the bad things for sale. Why should a man be permitted to deal in stinking houses any more than in stinking fish?

In both cases the offence is much the same, essentially. In both, for the sake of making a sordid (and also an unfair) profit, articles (food and houses) are offered in the market utterly unfit for human use; and in the case of small houses the general public is as incapable of protecting itself as in the case of unwholesome food.

I believe that there is law to meet the abuse, if only it were put in force. Why, then, do not the district surveyor and the sanitary inspector do their duty in the way that the food inspector does his?

Food, unfit for consumption, is condemned and destroyed. Houses unfit for human occupation should be also condemned, and pulled down!

The above description is in no one thing exaggerated or untruthful, nor is it given by an ignorant outsider. Any fact here stated can be verified by you if you choose. I enclose my card.—I am, &c., B. X.

INDIVIDUALISM IN ART.

SIR,—Believing your journal is open to suggestions made expressly for the benefit of architectural art, I hope that you may deem the following worthy of insertion. It is generally acknowledged by appreciative students, that what is called individualism is a strongly marked and most important characteristic of mediæval art, and it appears to some of us that a revival of this individualism is essential to the artistic success of modern architecture. This revival need not be at variance with the usages and customs of the present age; but it would simply be that freedom of artistic individual skill which gave its characteristic life and freshness to old work. This, it appears, is what the architectural journals are continually asking for, especially in the reparation of old buildings. The true spirit of the mediæval work, we always hear, is wanting. If this spirit is to be revived, the present system of automatism must be superseded. There is little real artist work developed now by individual skill; the hands are always working without any proper sympathetic action of the brain. Might not this be changed? Are there not among the various art associations some who are impressed with the importance of this subject, and who have ability to bring it forward for discussion? The new movement for more systematic technical instruction is a good one, but it overlooks the want of freedom in the workman. He may study carefully some decorative branch of mediæval work until he can produce artistic work almost as good as that of the old workmen; but automatism gives him a stencil plate, or a dull model, as

his guide; or, in some other way it binds him, totally neglecting the essential "spirit of the old," which was expressly founded on originality, and not copyism. It may be said that freedom will foster error, that there was indifference construction, bad anatomy, and crude design in the old work, and probably these all would be repeated. But for the lesser evil we should not forego the greater good, remembering rather that it is this long-neglected individualism which has always given the greatest value to material.—I am, &c., A WORKMAN.

NON-SURVEYING ARCHITECTS.

SIR,—"Clamans in Deserto" still maintains, against all experience, that the architect who prepares his own quantities has no inducement to take excessive quantities. But let us mark the reason he adduces. It is this: that the architect is anxious to keep the cost down to the amount of his own estimate, which is generally low. If this principle actuated the architect it would lead him to the alternative of easing the contractor, and he would soon be powerless to exercise any authority. This evil would be, if anything, worse than the other. But as my experience is so opposed to "Clamans in Deserto" in this matter, and not mine only but several others, and your correspondents, it does not appear of any benefit to discuss the matter further. With one who is bold enough to make such a reckless assertion that "the architect who does not take out his own quantities is powerless to protect his client," it is of little use to argue further, though all I care to affirm is that the doctrine is one that certainly opposes all the Institute has done to make the architect an independent factor. I may add that, speaking to a borough surveyor of a large town a few days ago, he strongly maintained the opinion herein expressed in relation to his connection with public business.—I am, &c., CONTRIBUTOR.

THE QUANTITIES QUESTION.

SIR,—There are, I consider, very grave objections both to architects taking out their own quantities, and the employment by them of the professional surveyor. The old plan of builders taking out quantities, either individually, or, in a large competition, collectively, I hold to be best for all parties.—I am, &c., M.

THE SETTING OF KITCHEN RANGES.

SIR,—Of a somewhat erratic turn, and wedded to the "close range," I have been at the expense of fixing many, and have invariably found Mr. Mason had to be frequently called in to remedy the evil of flame being visible in its route round the oven, and draught affected—various kinds of cement, plaster of Paris, &c., all proved failures. Twelve months back I tried what the more learned in the craft told me was bound to fail, as the flame would quickly destroy my intended "stopping." If the fissure was entirely filled the flame would, by reason that the face of the range would be colder, most certainly not be drawn there. I argued. My theory has proved most perfect, and the remedy effectual. Wherever a joint in the mortar of brickwork gave me a chance I thickly studded it with tin-tacks, then I administered a coat of paint, and when dry, well putted and smoothed it down, where the mason would have worked cement. The putty soon hardened, and of course I gave it a coat of paint. The heat has given it the hardness of stone, and having been done a year and no cracking, it may be looked upon as a permanence.—I am, &c., ONE UNCONNECTED WITH THE TRADE.

The annual meeting of the Sussex Archaeological Society was held at Hove on Thursday week.

The Hastings School Board has adopted plans prepared by Mr. Elworthy, of St. Leonard's-on-Sea, for schools in three departments for 306 children, to be erected at Silverhill at an estimated cost of £2,000.

A new Wesleyan chapel was opened last week at Thornbury. The building is erected in the Early English style, and will seat 250 adults. The materials are native sandstone and Bath stone dressings. Mr. E. Curwin, of Liverpool, is the architect, and Messrs. Stebbens and Bastow, of Bristol, the builders. The stone carving was executed by Mr. J. Sheppard, of Bristol and Nottingham.

Last week the memorial stone of a new Congregational church was laid at Prescott. The building is Gothic, and has cost £2,000, accommodating 350 worshippers. Mr. Ridsdale, of Rainhill, is the architect.

Our Office Table.

girders. Would any reader of the BUILDING NEWS kindly give me the formula for calculating the depth, thickness of metal, &c. of the main girders, either web or lattice; also how far apart, and the dimensions the cross girders carrying the corrugated iron platform should be? What are the minimum and maximum thicknesses the road metal should be? What size should the piers be for girders to rest upon—they are to be built with brickwork in cement? What kind of stone is best for the templates for girders to rest on, and what size should they be? How am I to ascertain that the bridge is capable of bearing the load stated (exclusive of the road metal) when it is completed—that is, how can I test it? A practical reply will oblige.—A SIX YEARS' SUBSCRIBER.

[50104.]—Lead Flats—Can any correspondent give me information about lead flats—so laid as to be always immersed in water—for the purpose of protecting the lead from the effects of heat and cold?—B. W.

[50105.]—Patent Silvered Glass.—Having fixed some patent silvered plate-glass in wood framing, with 1/2 in. wood back, against a newly plastered wall, I find the silvering is coming off the glass through the damp. I was under the impression that the patent silvered plate-glass was damp-proof. Can some kind reader tell me how to prevent the remainder from being spoilt?—J. H.

REPLIES.

[5088.]—Cement Floor.—In reply to "Field Rye's" inquiry, I should think the cause of moisture complained of on basement floor to be due to the condensation of moist atmosphere which is always present in a new house, and will make its appearance on the surface of anything cold and non-absorbing, until the house is thoroughly dry. The best remedy is to have the windows and doors open as much as possible.—R. J.

[5088.]—Cement Floor.—I should recommend "Field Rye" to dig a trench on one side of the basement outside the wall, and lay in tile drains, giving them a fall to the best outlet. The fact is, the soil is retentive, and probably the tile drains under the cement floor do more mischief than good in bringing in the soil water.—G.

[5089.]—Rolled Wrought-iron Girders.—"Ignor" does not state the bearing he wants his girders to be, but if they are, say, 15ft. long, beams of 10in. depth with 5in. breadth of flange, would be sufficient. A 10ft. bearing would require a beam of 5in. deep.—W. G.

[5091.]—Window Tracery.—The simplest method of drawing tracery is to reduce the tracery bars to their central lines, and then to carefully find the centres for striking the arches, circular parts, cusplings, and measure the several radii. An outline sketch of the window, showing the centre lines, should be first carefully drawn, and afterwards figured in; this being done, the glass openings clear of the tracery should be measured and drawn, after which the filling-in of the mouldings will present little trouble. If "Alpha" proceeds on this plan he cannot err.—STUDENT.

[5091.]—Window Tracery.—Get Billings's "Infinity of Geometric Design," and you will have fine practice at window tracery. Batsford, of Holborn, has a copy, I think.—GEORGE B.

The foundation stone of the new parish church, Parracombe, Devon, is to be laid by the lord of the manor, J. Pyke Nott, Esq., on the 12th proximo. Mr. W. C. Oliver, of Barnstaple, is the architect.

New Board Schools were opened at Over, on Wednesday week. Mr. J. W. Tronson, of Stonehouse, Devon, was the architect, and Mr. Eli Pickstock, of Over, the builder. The cost was £2,700.

St. Mary's Church, Tunstall, was reopened, after repairs and additions, on Sunday week.

A new mission-room has been erected in Hotwell-road, Clifton, by Mr. Thomas Young, from the design of Messrs. Foster and Wood, architects, of Bristol.

The parish church of Claybrooke has been restored at a cost of £2,500, from designs by Sir Gilbert Scott. Messrs. Roberts and Son, of Weedon, were the builders.

Ipstones Parish Church was reopened on the 9th inst., after repairs, at a cost of £1,200, under the direction of Mr. G. Gilbert Scott, M.A.

Mr. John F. Van Camp, a builder, of Trebovin-road, Earl's-court-road, Kensington, was fined 30s., and £1 13s. 6d. costs, on Saturday, for using a furnace not constructed to consume its own smoke.

Mr. W. Morris, the poet-decorator, has promised to deliver in the metropolis next winter a series of lectures on the history of decorative art, under the auspices of the Trades' Guild of Learning.

The Primitive Methodist chapel at Hessele has been restored and enlarged at a cost of £281, from the designs of Mr. R. Potts de Reader, M.A.A., of South Shields.

The Tay bridge will probably be ready for the passage of the first locomotive by the middle of next month, and if nothing occurs to retard the work it will be open for traffic by October.

THE directors of gas and water companies, when communicated with by local authorities as to the terms on which they will consent to the transfer of their duties of control, management, and receipt of dividends, are usually suspected, and occasionally with some show of reason, of a disposition to strike very hard bargains with the ratepayers, and an antipathy to parting with either powers or property. It is not often, however, that they are accused of such neglect of the art of polite letter-writing as is conveyed in a resolution unanimously agreed to by the Birkenshaw Local Board of Health last week, which recommends "that, after the insulting correspondence from the Gomersal Waterworks Company, the committee take no further notice of the matter;" this "matter" being the previously-projected purchase of that portion of the waterworks company's property laid within the district. The aggrieved and offended local board has instructed its committee to leave correspondence with the Gomersal Waterworks Committee, and to make "the best possible arrangements" with the Bradford Corporation, who, it is to be hoped, will treat the members of the Birkenshaw Urban Sanitary Authority with that respectful courtesy which a regard for the high and important functions they are called upon to discharge will indicate to be due to them.

An inscribed stone, dating from the stormy days of the Civil Wars of a couple of centuries since, has just been noticed at Nottingham "Castle," where it had been built into one of the walls. It is about 12in. by 7in. on the face, and the inscription is surrounded on three sides by a border, the lower part having been broken away. The writing is nearly effaced, but Mr. Hine, the author of a monograph on the castle, assisted by the Bishop of Lincoln, reads it as follows:—

NE : INTRES . IN . IVDICVM
CVM . SERVO . TVO . DOMI
NO . QVIA . NON . IVSTIFI
CABITVR . IN . CONSPECTV . TVO . OMNIS
VIVENS . SCRIPTVM . PER . ME . IOANNEM
SPOR . WOD . DIE . IOVIS . NONODECIMO . DIE
MENSIS . ANNO . MILESIMO . SEXCENTESI
MO * * * * * QVADRAGESIMO

The history of the Civil War would give warrant for believing that this is the work of an unfortunate Royalist, John Sporwood by name, probably one of Prince Rupert's officers, and that it was executed on Thursday, the 19th January, 1643.

St. MICHAEL'S CHURCH, at Marblehead, Massachusetts, which, according to the *American Architect*, is the oldest edifice of the Episcopal Church in New England, was erected in 1705, the frame and all the material used in its construction being carried from England. The building retains many of its original features: the ancient reareds, with its credo and decalogue; the ancient chandelier, "the gift of John Elbridge, Esq., of ye city of Bristol, 1732," which, on special occasions, is used to illuminate the church; the original lock and key with which the doors were fastened by the church fathers; and the same old pulpit, of a wine-glass pattern. It is a boast of the old parish that its second rector, Rev. David Mosson, performed the marriage ceremony for George Washington and Mrs. Custis.

On Monday, under an arrangement made between the Vestry of St. Luke's and the owners of the property, one of the most important social and sanitary improvements which has been carried out since the demolition of "Tiger Bay," Ratcliffe-highway, was successfully completed. Acting under the provisions of the 57th of George III., which empowers vestries and other local bodies to acquire property for the purposes of social or sanitary improvements, the Vestry of St. Luke's and the Metropolitan Board of Works decided, at a joint cost of £100,000, to widen Golden-lane from Old-street to the City boundary to a span of 50ft. (the City authorities under the Artisans' Dwellings Act carrying on a similar widening of that part of the street within their jurisdiction), and at the same time drive a new street, running at right angles to

Golden-lane, through Bridgewater-gardens to Aldersgate-street. In carrying out this portion of the improvements, the vestry determined to include a block known as Cupid's, Bell, Vine, and Robin Hood Courts, and Barber's-yard, lying between Playhouse-yard and Bridgewater-gardens, and described by the sanitary inspector for St. Luke's, Mr. James Neighbour, as "the most infamous den in the metropolis—a hotbed of filth and contagion, consisting almost exclusively of houses of ill-fame of the lowest type, and occupied by the most desperate section of the criminal classes, both male and female." The street is to be the width of Cannon-street, and the congregation of the Welsh chapel in Jewin-crescent, lately pulled down to make way for City improvements, have secured the most favourable site for their new chapel.

A GOOD many sensational statements are going about just now as to the extravagant profits being made by brickmakers, and a paragraph has been going the rounds of the papers this week emanating from the brains of some ingenious London correspondent, in which the rise in bricks is ascribed to the unanimity with which unfortunate capitalists, debared from investing their money in Turkish loans and other profitable foreign securities, have rushed into the speculation of building houses in the suburbs of London. As a matter of fact, not nearly so many suburban houses are building at the present time as were being put up, say five years ago. Except perhaps in the North, the suburban house-building has been rather overdone, and until a few more of them are occupied or have tumbled to pieces, the speculative builder must rest a little on his laurels. The rise in bricks is due mainly to the increased cost of fuel and labour, and the great demand caused by the great engineering and railway works in progress during the past few years in and around the metropolis.

THE old parish church of Poulton-le-Fylde, near Preston, has been partially restored internally. One part of the restoration consists of a new pulpit and reading-desk. On the removal of the so-called old pulpit from the place in which it had been deposited during the alterations, one of the outer panels gave way and revealed a very fine and much older oaken one. It is octagonal in shape, and three of its sides are in very good preservation—a fourth had been much injured when the covering was put on. Each panel is richly carved, square-cut, out of the solid. The main division in each contains a very beautiful Norman arch, and each of the lower divisions is filled with a representative head in the centre, surrounded by a floral design in one case and foliage in another. On the frame-work round the top is cut, "Crie aloud, spare not, lift up thy voice lyke . . ." Here the text ends, which leads to the supposition that the fifth panel has been either lost or destroyed. The pulpit in which it was encased (hitherto called the old one) is made of deal, and the colour and panelling correspond with the north and south galleries; these were erected about 140 years ago. One remarkable thing in connection with the pulpit is that it has been removed, in its encasement, no fewer than three times within the last 55 years without the slightest suspicion of the presence of such a valuable relic. The oldest inhabitant never heard of the merest tradition of its presence.

A new Merchants' House has been erected at Glasgow at a cost of more than £32,000, from the design of Mr. John Burnet. The style is Italian.

St. Paul's Church, Devon-square, Newton Abbot, is temporarily closed for internal renovation, executed by local workmen. It will be opened on the 6th prox.

The Congregational chapel, Lapford, Devon (rather a commodious building for the size of the place), is to be re-seated and re-decorated under the superintendence of Mr. R. Cruwys, of Barnstaple.

Messrs. W. and J. J. Kier have been entrusted with the execution of the historical stained glass windows for the Merchants' House, Glasgow.

A vestry, fresh entrance, and porch, are being added to the Chapel Royal, Savoy.

The foundation stone of a Convalescent Home was laid on Wednesday at Hunstanton, Norfolk. It will be of brick, with stone dressings, and will hold 40 patients.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 31, 1877.

ARCHÆOLOGY AS A STUDY.

JUST now the meetings of the archaeological societies are busy, and attracting a large share of public attention. The Royal Archæological Institute has recently terminated its visits and labours in one of the richest and most interesting of districts, a full and special report of which has appeared in our columns; the Worcester Diocesan Archæological Society has been engaged in a like pursuit, and this week the British Archæological Association is holding its annual Congress in the romantic town of Llangollen, a full report of which we publish. For a different object, the British Association has discussed various questions of scientific interest, which are just now absorbing the study and attention of our foremost scientists. The somewhat opposite character of these meetings—one pursuing the past, and the other the present phase of knowledge—is at least indicative of the activity of our national thought, and the scope of our progress. It has been said architecture died out *just* when archæology began to be cultivated as a study; and it certainly is a somewhat singular coincidence, suggestive to the reflective mind, that the wealth of our literature in art—our museums and galleries, our photographs, our sketches—has accumulated almost simultaneously with the loss of our originality or invention as artists. One society, indeed, has founded upon this concurrence of things its claims as an organised body for the protection of our ancient buildings, and its chief article of faith is that we have no style, and that architecture has “died out.” To say the least, it is not very flattering to the modern architect that he is called upon to renounce all invention, and to go back to the origin of art as a mere reader of its secrets. But has this doctrine of the archæologist the claim it is said to have? Or has not archæology rather stepped beyond its bounds in setting up its own test of art? There is some reason to fear that the latter is the case. The true domain of archæology is to trace out, decipher, and classify the remains of past art: if it does this systematically, it may certainly lay claim to the dignity of a science. But if we mistake not, the archæologist believes his special knowledge is the unfolding of architectural principles, or that his discoveries are the only road to architecture. In this view, we believe, the modern student of antiquity is mistaking his proper aim. Archæology has a close relationship to language and religion, and both these latter have been found by that great ethnologist, Professor Max Müller, to be intimately related. The three great centres of language—the Aryan, Semitic, and Turanian—have been discovered by Max Müller to be those of well-marked religious beliefs, and the ethnologist can trace in the words of certain languages the modes of thought and religious life of those races. Thus the names expressive of the Deity have clearly indicated the kind of worship of those primitive races. Now, archæology, if it teaches anything, should similarly indicate the social habits of bygone nations or epochs, their states of industry, and their modes of worship, and to arrive at these results the scientific archæologist should have recourse to all those facts which may enable him to form or verify any hypothesis. To be able to distinguish the dates of a few windows, to trace the genealogy of a certain founder, to give a date to a tile or painted window, to detect the symbolic meaning of a piece

of sculpture, or to ransack ancient M.S.S. for the purpose of discovering the object of an effigy, are useful enough when some hypothesis is before us which the several discoveries help to corroborate or refute, but, regarded as mere details, they are of little interest to the science. Studied apart from a general acquaintance with architectural classification and nomenclature, archæological investigation leads to the raising up of a class of students who ignore the work of the architect, while the architectural student is influenced unduly by such teaching if he have an archæological penchant at all. There is, nowadays, a considerable danger of architecture being influenced by archæological conservatism. It has, probably, already operated to check our progress. To instance a few matters. Our church-restorers have been healthfully restrained by the influence of archæological societies, but the idea of knocking off all the plastering from our church walls with the notion of reverting to a certain age has done infinite harm to progressive ideas of church-building. Again, a recent society has found out that their predecessors went too far, and that the 16th and post-Reformation additions and monuments have as much an historic charm as the 13th century had. We are bid, therefore, to leave things as we find them—not to restore at all. Now, there is no question both these doctrines proceed from the archæological temper being at utter variance with modern art; and not only this, but its going beyond the direct objects that archæological science has in view.

A personal acquaintance with some of that highly-respectable body has tended to confirm our idea that they are exceedingly opinionated, and that the modern architect is regarded as little better than an ignoramus in the art he professes. The tendency of antiquarian research is unquestionably exclusive, somewhat dogmatic, and inclining towards an esoteric view; this it is, perhaps, almost necessarily. The very habit of tracing well-authenticated data and types from a long-continued series of observations on old buildings, the following of traditional history, and the hunting up of legends, constitute a kind of study in which the student may bury himself in the past, taking no heed of the present. There is something of an infatuation in the pursuit of this kind of discovery, in bringing to light crumbled sculptures, in deciphering the chronicles of antiquity, and in reconstructing from a few disjointed fragments an abbey or a ruined castle. Conjectures are all based on previous facts or some tradition. The average archæologist has but a very slight knowledge of architecture, much less of building, and this fact has gone a long way towards estranging the two. One has studied art objectively—his knowledge of style and constructive peculiarities is derived solely from existing remains of ancient buildings; while the architect has studied it both from actual buildings and from his own experience—both analytically and synthetically. In examining an old building, the student of antiquity looks upon it as a relic, but the architect sees in it a method and a plan. This disagreement is probably the reason of the want of accord between the archæologist and architect, and until the strict line of demarcation is drawn we must not expect to find any sympathy between the followers of the two classes of study. Thus the discussion of the round and pointed arch has been based upon very opposite considerations. One party swears by the dates between which the round arch prevailed in England, and another regards its existence as due to constructive exigency. Recent investigations have rather favoured the idea that the pointed arch was not introduced as a feature but as a neces-

sity of vaulting; the archæologist has been slow, however, to accept the latter doctrine, despite the evidence of certain French examples. Again, the terms Saxon and Norman were indiscriminately applied at one time to the round-arch style, as it was thought to have been introduced at the establishment of Christianity among the Saxons, in the 6th century, and continued to about 1135. The question of Roman or Norman has been another fruitful source of controversy; Colchester Castle has been pronounced Roman by one set of archæologists, and Norman by another—the crucial point being the existence of masonry that bears a strong resemblance to Roman. It has been found, however, that the Normans used the thin bricks and the coarse mortar, considered distinguishing features of Roman work. One set of archæologists long disagreed as to the dates of certain types of fonts and towers, and even to this day the arrangements of conventual buildings afford ground for various conjectures. The advancement of the study of ecclesiology, as a distinct branch of archæological study, has considerably helped to settle, however, many points of doubt in ecclesiastical and monastical arrangements, such as the position of the refectory. To the late Mr. Edmund Sharpe we owe much for having directed his extensive and critical knowledge of buildings to archæological investigation. Again, much is due to Mr. J. H. Parker, Mr. Mackenzie Walcott, Mr. Bloxam, and others, for having laboured to place the study on a somewhat rational basis. There are so many different branches of the study—some relating to pre-historic and Celtic monuments, some to monastic remains and churches in their several subdivisions of architecture, monuments, glass, sculpture, &c.—that it would be vain to expect from one a thorough acquaintance with the subject. It would, however, be extremely desirable if the various societies that yearly make inspections of our antiquities were to unite in laying down the bases of their investigations—that is to say, to categorise their labours, and deduce therefrom some general conclusions in relation to the several subjects of their visits and inquiry. A long and elaborate paper on some castle or abbey is read, full of detail and of intense interest to many, guesses and conjectures are set forth, and a discussion sometimes follows of a very incoherent kind. In a few years after the same antiquity is visited, and another theory probably broached, but archæology gains little. Only an extensive and critical observation by various minds, directed to one point of inquiry, can solve a doubt, and it would be of great value to collect the various conjectures, discuss them at a biennial or triennial congress of the societies, and publish the results for future use. We are doubtful whether the desultory and fragmentary literature of our archæological societies has done much, or is of any value except as containing the individual guesses of a few. But before such a method can be inaugurated the objects of archæological inquiry must be fixed; and, as regards buildings, the archæologist must be so far acquainted with architecture as to be able to bring such knowledge to bear upon any subject of inquiry; he should be acquainted also with the geology of the localities he visits, and be able, in a word, to bring as many lights as possible to his task. It is desirable, in fact, that annual visits should always be accompanied by the architect; and we fear at present there is not that cordiality of sentiment between them as there should be. The papers of Sir Gilbert Scott on our cathedrals have a thoroughness in them which the mere antiquary could not impart. Hence, too, Mr. Blashill, the other day, corrected a general impression that the grand western

arch at Tewkesbury was in reality nothing but a tower archway which carried the inner wall of a west tower now destroyed. Only a knowledge of masonry could have shown such a conjecture to be ill-founded. We do not mean to say that an architect would be necessarily right in his conjectures, but the probability is that in the majority of instances a technical or practical consideration readily determines a doubtful point which a band of antiquaries might have disputed till doomsday. An antiquary can only base a conjecture on a well-established precedent or a general concurrence of certain types and workmanship with a certain date, or on tradition; but the architect can bring his building knowledge to aid his architectural. A general concurrence of types with certain dates must not be too implicitly relied on in the absence of other facts or collateral evidence, and, like the reasoning of the scientist, the archæologist should verify his hypotheses, and no one should be adopted till this verification has been carried so far as to give predominance to it.

MARKETS, WAREHOUSES, AND SHEDS.*

THESE unpretending classes of building have at length found an author. Architects have been too much intent upon the more pretentious kinds of structure to find time or inclination to publish designs of such commonplace structures, though many are ready enough to find fault with our modern warehouses and markets that have been left in the hands of engineers or borough surveyors. Mr. Alexander Friedmann, C.E., councillor of the city of Vienna, some time ago published the results of his labours and designs for proposed markets and warehouses for that city, and Mr. E. H. d'Avigdor, B.A., C.E., member of the Austrian Society of Civil Engineers and Architects, has translated the original work into English, and has presented it in a dress rather unusual to English readers. The size of the work is a large folio, and the sheets and plates are loose in the usual French portfolio form. Glancing over the first few pages of this work we find that the novelty of Mr. Friedmann's ideas consist in the disuse of cast-iron columns for these structures, and the substitution of wrought-iron framed columns, the angles being united by lattice work. The designs comprise a large variety of constructions from simple sheds to central market halls and warehouses, with details and calculations of the constructive parts. There are 27 plates, which have been reproduced by photo-lithography. The author's aim has been to solve the difficulty of covering large areas by wind- and weather-tight roofs, having few breaks, and avoiding valleys, and to obtain light from vertical windows rather than from skylights. This he does by forming a series of parallel slopes or aisles on each side of a central nave, and combining them together for any required purpose or idea. These are either simple parallelograms of from 3 to 5 or 7 aisles, the central being the widest, with a span roof, or two or more parallel blocks of this kind, united by cross buildings of lower elevation. Various alternative designs are shown for various problems, but the same principle of construction is exhibited throughout—namely, square open lattice-columns of wrought iron, carrying roof principals of the same kind, placed at flat pitches, and tied together. To give our readers some idea of the method of construction adopted by Mr. Friedmann, we may allude to the principles as stated in the

general remarks. The author says:—"For very low buildings cast iron may be used, although such sheds have frequently given way when the climate is very severe, as for instance, last winter at Bucharest. The columns suddenly snapped, either in consequence of uneven settlement of the foundations, or by the lateral thrust of a violent storm, or possibly by the crystallising action of extreme cold on cast iron." As the author observes, cast iron offers a safe resistance to steady vertical loads in compression, but no security against tension and torsion, such as those caused by violent wind. "In the latter case we can no longer consider the absolute resistance to fracture of the material, but the dynamical effect or 'work' it has taken up before and until the fracture, which 'work' is a function of the pressure multiplied by the space which the different molecules move through. This space is equal to the extension of the material at the moment of fracture; and this possible extension is much smaller for wrought iron than for cast." Rolled iron has then an immense advantage. Speaking of the section of column adopted, the author observes: "I propose to divide the material which supplies the real resisting power over the four angles of the square or rectangle of the section, and to unite these by lattice work." These angles are really angle-irons placed at the required distances apart, joined by four lattice webs, which do nothing else but keep the angle-irons at the proper distance from the centre of gravity or neutral axis of the horizontal section; so that the strength of the isolated column is obtained by placing the material of resistance as far as possible from the central axis thus increasing the moment of inertia of the column. This open web column has undoubted advantages over the solid plated or tubular columns, designed by Mr. Krantz for the Exhibition of 1867, or that adopted by Mr. Henry Schmidt for the Vienna building; for, in case of lateral pressure, only two of the opposite plates resist the strain, and the other two are of little use. The system of Mr. Friedmann is no doubt the most economical, and it also allows of a larger base or cross section; but he is in error in thinking that he was the first to have thought of this open form of column, which has been used in America for years, and has been also largely adopted in England. But we give the author the credit of having first published a series of designs showing the application of this system to the construction of large buildings. It must be remembered that the greater the span the greater is the weight of ironwork per square of the area covered: while the shorter the span the greater is the number and weight of the supports. These considerations lead us to adopt such a span as will combine the advantages, if possible, of both; and the height of the columns becomes the primary consideration, and this is regulated by the span and height of building. As regards the area or site, the author states, as a general rule of some importance, that the cost of the foundations will be less, if the longitudinal axis of the buildings is parallel to the direction of the strata, than if it is at right angles.

The first design is the construction of a market covering an area of 220,000 square feet, and proposed to be erected in the city of Vienna for 5,000 horned cattle. The site or plot of land is shown by a detailed plan, with sections or contours. It forms a slope, formerly one of the banks of the Danube, and the author proceeds step by step to solve the problem. The pig market is placed on the lower or alluvial part of the ground, where the stratum is less firm, and the main structure on the higher part. Three alternative plans are shown, and the reasons which induced the author to depart

from the first are given. The study of the construction of the buildings is fully explained, and is interesting. In two alternatives the roof is divided into three classes of trusses. The first covers the central nave, and is the highest; the second covers the main aisles, and the third covers side galleries at right angles to the centre line. There are no V-roofs or interior gutters like those of the Paxton roof. The climate of Vienna and the snowfalls preclude such a mode of construction. During severe frosts the water in the valleys freeze at the mouths of the down pipes, and a long valley or V-roof would be choked up, if not rendered dangerous. A third alternative design shows a parallelogram with a central longitudinal building of three avenues and lateral aisles or wings abutting at right angles to it—these latter consisting of smaller repeats of the main central structure. A fifth alternative shows the entire avoidance of the lateral wings, and consequently of valleys, the plan being an immense parallelogram, 230 metres in length (754ft.) by 102 in width, divided into seven longitudinal aisles by rows of hollow lattice columns. The roof consists of a central span of flat pitch covering the nave, 26 metres to centres of columns, and three aisles on each side, measuring respectively from the centres 13m., 13m., and 10·80m. The roofs of these are slightly more sloped, and have three tiers of clerestory lights on each side, the nave having a raised lantern along its ridge for ventilation. Though the ridge is 88ft. 6in. high from the ground, the author does not fear the height of the building, nor the effect of its larger cubic capacity, for it is not the volume of air contained that has to be considered as regards warming, but the surfaces of the building exposed to cooling. The area exposed to heat or cold is the question, and not the cube contents, and it was found that the area of this design is smaller than that of the previous design, though much higher, and therefore that this plan is most economical in the retention of the warmth from the cattle in winter time. The lighting is by vertical or clerestory windows, and sloping skylights are avoided; thus the expense of badly-fitting roof-lights is obviated. An interior perspective is given, showing the effect of the immense structure. Speaking of the ventilation, it is proposed that the velocity of the fresh air which enters should not be too low, and the total area of openings for the fresh air multiplied by its velocity must be equal to the total area of the ventilators or louvres multiplied by the velocity with which the foul air passes through them, and the greater this velocity is the better. It therefore follows, that the ventilators should be as high as possible above the floor, and that the ingress be as near the floor as possible. It is consequently proposed that all the clerestory lights be closed, and that the ingress openings be made only so much greater than the ventilators as the speed of the outrushing air is greater than the incoming air. For the above reasons open sheds are, on calm days, more unbearable than closed ones with lofty ventilation and with well-distributed openings near the floor. These latter should be placed higher than the height of a man so as to avoid friction. The length of the stalls, including the 4ft. path behind, is 3·79 metres, the distance between the principals being 7·62 metres. The paths are in the centres of the three main naves; thus the market is divided into blocks of stalls by five longitudinal passages, as in the Paris market, of which two are used as footways. There are two cross passages. At one end the longitudinal passages lead to the slaughter-houses, and at the other to the roadway. As regards the details, the principals are of double

* Designs for the Construction of Markets, Warehouses, and Sheds. By ALEXANDER FRIEDMANN. Translated by E. H. D'AVIGDOR, B.A., C.E. London: E. and F. N. Spon, Charing-cross.

lattice girders, to agree with the columns, and the whole weight is calculated at 100lb. per square yard. The tension bars to the main roof trusses connect the principals with the columns—and, in fact, cross the main tie-rod of the truss, uniting the ridge of the main principals with the columns at their junction with the aisle principals. The angles between the columns and principal rafters have also brackets of open lattice-work. The outer principals rest on shoes, on which they can slide to meet the alteration of length due to temperature. The covering is zinc, laid on boards, which rest on longitudinal timber purlins. The wind pressure calculated is 100 kilogs. per square metre—this is a maximum, the total horizontal pressure being calculated at 20lb. per square foot, and the total vertical load of same at 5·2lb. For rafters which are subject to vertical pressure 15·5lb. per square foot is assumed, and an additional 12·4lb. per foot of the horizontal plan of roof for the components of the wind acting vertically. The calculation of the details is minutely worked out and fully described. The other designs illustrated show sheds with curved roofs, and an adaptation of the old ironwork of the Vienna Exhibition of 1873. The latter idea was a suggestion by the author to the municipality to use the materials in the construction of a central market, and several plans are worked out with this object. We certainly cannot accept the design on Plate XV. as a successful work architecturally. The front elevation with the two segmental pediments of the main aisles is very weak; the continuous roof alternative is much more pleasing. Chapter III. treats of the construction of warehouses for harbours and estuaries. Various designs are given, all more or less ingenious and suggestive, showing warehouses on the water side, warehouses with American vaults, and giving full details of the construction. Many of these designs display considerable merit. In each case the adaptation to the site, and other conditions of the problem, are fully entered into, and various practical rules are given that will be found of much value to the engineers of our docks and harbours. Most of the examples given, it is true, have been designed with reference to the requirements of the Danube, near Vienna, but they will be found to admit of easy modification adapting them for any similar position. The principles of construction laid down by Mr. Friedmann are sound; and though we cannot accept many of the designs as being architectural solutions of the problems presented, we have no hesitation in saying that the English and American engineer will find his work a useful addition to their libraries. In our Indian colonies also the method of construction proposed adapts itself admirably as little more is required than skilful riveting of the parts.

Mr. Doswell, of Frome, has been elected surveyor and inspector of nuisances to the Ashford Local Board.

The restoration of Malton Priory Church is being proceeded with, under the direction of Mr. Jones, of Malton and York, by Messrs. Keswick and Sons, builders, of York.

An interesting discovery has just been made at St. Alban's Abbey during the laying down of gas pipes for the purpose of lighting up the cathedral portion of the building. It has been considered by many authorities that the ancient chapter-house, which was destroyed, to fix the latest time, at the early part of the eighteenth century, stood on the south side of the slype, and this conjecture has been confirmed by the discovery of the responds and of the northern, western, and eastern wall. The responds are deemed the most elaborate zig-zag traceries Norman mouldings yet found in this country.

The workmen in the employ of Messrs. Robert Wilkins and James Hill, builders, of Ashley-road, Bristol, had their outing at Weston-super-Mare on Saturday.

THE CONGRESS OF THE BRITISH ARCHÆOLOGICAL ASSOCIATION AT LLANGOLLEN.

[FROM OUR OWN REPORTER.]

THE first Congress of the British Archæological Association in Wales follows very appositely that held in Cornwall last autumn, for each partakes of the character of an examination of the hills and fastnesses to which the earliest inhabitants of which we have records were driven by the successful invaders from the Continent. The field to be traversed is in both cases an unusually wide one, and the buildings and other objects to be examined are not scattered over it with great profusion; but the programme for the series of meetings which opened on Monday at Llangollen shows a larger proportion of mediæval to "pre-historic" objects than was the case in Cornwall. Barrows and earth-mounds exist in both cases in sufficient number and variety to afford exercise for the profoundest antiquary, but in place of the cromlechs and sacred circles that were so frequently puzzled over and discussed during the excursions from Penzance at the close of the Congress for 1876, there are in north-east Cambria the shattered fragments of castles of every date, that denote a border district, and several abbeys of the Cistercian order, all in a greatly ruined condition. These castles and abbeys have a close relation to events with which extant history renders us familiar, and afford in their internal evidences of dates of erection and enlargement, together with the too scanty documentary records relating thereto, tangible subjects for investigation, and are, therefore, of general interest. In both districts the natural beauty of the scenery is, undoubtedly, the chief attraction to many of the members, and in this respect the neighbourhood in which the congress is now being held is unequalled in South Britain. To the archæologist North Wales associates itself with the fortress boroughs of Chester and Shrewsbury, for although both are thoroughly English towns, each has been intimately connected for ages past with the Marches over which they once held guard; each has played a prominent part in the making of the history of the Principality, alike in commerce and in warfare, in the disputes and in the bargainings continually going on in mediæval days between the sturdy Cymri and the ever-encroaching men of Mercia. An added charm in the eyes of the ponderer on the past, both to Pengwern and to Deva, is that as yet the obliterating march of progress has not passed over them to any large extent, as each retains very many of the characteristics of a fine old English county capital. Thus each yet possesses a castle, encircling walls, and gates, recalling to memory the occasional sieges and the border frays innumerable witnessed in each. Each has an abbey or minster, remains of conventual buildings, and numerous parochial churches. Each is remarkable for the picturesque beauty and variety of the half-timbered and gabled mansions built by its merchants and traders over their places of business. With these stores of specimens of domestic, ecclesiastical, and civil-military architecture, an archæological programme of peregrinations in the Principality of Gwynedch would scarcely be deemed complete unless it included a peep, hasty though it necessarily would be in a week's excursion, at one or other of these towns. The Rows and Cathedral of Chester will probably be seen on the closing day of the Congress, as the city is to be passed through *en route* to Mostyn and Basingwerk. An unavoidable omission from the arrangements we remedied personally by availing ourselves of the opportunity, on the way to Llangollen, of glancing at

SHREWSBURY.

The Castle at once attracts attention from its excellent position on the highest point of the promontory formed by a bend of the Severn. It is so close to the railway station as literally to overshadow it. Chiefly Edwardian in the character of its keep, and the squared polygonal mass of towers and buildings surrounding a bailey, it yet exhibits in an arched gateway, and parts of the massive structure, some of the handwork of Roger de Montgomery. From it the town wall can be easily followed

nearly round the town, and on the west side is one of the gates, a low square embattled structure in two stories, with narrow loopholes. The red sandstone, of which these fortifications and most of the churches are built, is very deceptive, its crumbling surface suggesting an earlier date to edifices than their architectural features warrant. The peculiarly soft outlines given by this partial disintegration, where exposed to weather, has rendered Shrewsbury, like Chester, peculiarly attractive to the sketcher. The chief feature of the town is, however, its half-timbered houses, of which numbers remain in the principal streets. A noteworthy group is that at the corner of High-street, and the square known as Ireland's Mansion, and now forming several shops and residences. The massive oak framing is freely carved, and the overhanging upper stories, projecting gables, and tiled roofs, all add to the effect. Opposite is a house 60 years later in date, for it has inscribed on its front, 1592, in which all the gable posts end in carved figures, and the quarterings are cut into quatrefoils. The timbers of all the houses are tarred, the plaster between being frequently lime-washed. The great variety in these timber constructions has not been sufficiently taken into account. Every man building a house, while adhering pretty closely to the common model of the framing, has so individualised the treatment and the arrangement of the quarterings and decorative features that there are no two houses alike. In the centre of the Square is the old Market House, a good example of the style that prevailed in the later days of Elizabeth; its fantastic enscolled parapet and odd gabled openings and niches being in keeping with the tiled roof, handsome chimneys, and the pillars on which it stands. Under a canopy on the chief front stands the small statue of Llewellyn removed from the Welsh bridge in 1791. Another inscription between contemporary coats of arms of England and Shrewsbury informs us that this hall was "begonn and covered in by ye yen baylifles in 1596." More pronouncedly Tndor (in accordance with its slightly earlier date of erection) is the Grammar School. Several of the nine churches are of interest—those of St. Mary and St. Alkmund have very lofty spires. As in several other cases in the adjacent counties, the towers to which these slender spires were added, about the end of the fourteenth century, are not themselves sufficiently high to appear good in proportion. In a churchyard are two bays of the bishop's chancel of the collegiate church, erected in 1493 on the site of the Saxon church of St. Chad, founded A.D. 780. No part of the existing structure, the rest of which fell in 1780, appears of earlier date than that of the second foundation; but the mouldings and tracery are treated with much grace for so late a period. Traces of monastic institutions crop up on every hand. Following a narrow thoroughfare close to the Welsh bridge we come upon remains of a small house of Austin Friars, the outline of the chapel and some of the domestic buildings being clearly distinguishable, although now used for the storage of timber. Crossing the wooden but picturesque English bridge we visit the Abbey of SS. Peter and Paul. Only the nave and its aisles of six bays remain, fragments of the transepts and indications of the chancel existing in the churchyard. The form and mouldings of the piers of the central tower, now external, and those of the arcade, and the circular-headed doorways, exhibit fine work of the latest type of First Transitional. The small piece of a north transept wall, yet erect, contains an Early Decorated west window almost perfect, and traces of successive alterations abound. In the fifteenth century the roof pitch was lowered, the aisles being simultaneously raised and filled with large windows; and, at a still later period, a heavy tower of three stages was added at the west end; this was left unfinished, and in the days when the rage for inexpensive restorations had infected vicars and their churchwardens a red-brick parapet was added by way of finish. Some of the quaint buildings in the Foregate having been noted, we resume our journey after an afternoon of archæological recreation, the more pleasant, perhaps, because "not on the programme."

LLANGOLLEN.

The town itself presents few attractions to the archæologist other than is afforded in the rounded and forest-clad mountains by which the narrow vale is inclosed, and in the miniature cascades of the river Dee as it leaps and dashes in foamy shallows over the ridges of rock in its slaty bed. Indeed, the view presented from the railway station suggests that the charms of mountain, vale, torrent, and lake has had as much influence as antiquarian considerations in inclining the council of the association to select Llangollen as their head-quarters for the Congress of 1877, and although the architectural features of interest are almost confined to the parish church, the narrow-arched, steep-pitched, heavily-buttressed bridge, spanning the Dee (in former days, and before it was widened and made of easier gradients, considered one of the Seven Wonders of Wales), and the fragments of Castle Dinas Brân, which break the sky line of a lofty conical hill on the opposite side of the river. The parish church stands in the centre of Llangollen; it is a large but very plain structure, consisting of nave and chancel, with continuous north and south aisles to both, and west tower of three stages. It has been recently restored and reseated. The best feature is the hammer-beam nave roof, which has figures of angels on the corbels; the ceiled space between the two easternmost principals is filled with richly-carved oak panelling. As usual in Wales the roof is said to be brought from elsewhere—in this case from the Castle on Dinas Brân, but it has evidently been framed and designed for its present position. In the eastern bay of the north aisle is the canopy of a tomb, of very late 14th-century work, with cinquefoiled cusping and deep moulding; to this has been added a very stiff label, decorated with the rose ornament, and flanked by crocketed pilasters. The church as a whole seems to be of 14th-century work, but in the recent restoration some windows and arcading of at least a century prior in style have been inserted, with what authority it is not easy to see. The church is dedicated to the ancient British saint, Collen. A temporary museum has been arranged in the Assembly-rooms, consisting of a small series of antiquities found in the vicinity of the localities to be visited during the Congress. Amongst the exhibits may be specially noted a massive silver salver, lent by the President for the year (Sir W. W. Wynn), which has very skillfully set into its border, so as to display both obverse and reverse, 128 silver coins of the earlier Roman emperors, found at Wynnstay. The President also showed a mammoth watch, a relic of the Armada; it is about as big as a Bath bun, of great weight, and still "goes." A number of bronze implements and celts, dug up near Corwen, were contributed, and many other specimens of pre-historic date were arranged in the room, in addition to the objects exhibited by members of the Association from London and elsewhere.

MONDAY.

PUBLIC RECEPTION AT LLANGOLLEN.

The proceedings of the Congress commenced on Monday afternoon at 5.30 at the County Hall. Here the members were officially received by the local committee. Mr. Theodore Martiu, C.B., LL.B., as their chairman, offered the members of the British Archæological Association a very cordial welcome on behalf of the committee, the local board, and inhabitants generally. They would see by the showers of the past few days that Wales, like other wayward beauties, had her tears as well as her smiles, but it was to be hoped that these members would also see the Principality in a sweeter mood during the week, which promised to be one of very busy investigation. There were in the neighbourhood some magnificent ruins of old castles and abbeys about which he had hitherto not been able to obtain very definite information, and he trusted that the result of this Congress would be that he (speaking personally) should understand more accurately the history and character of these remains than he had done hitherto. However, he would not longer detain the members, as he believed they were about to pay a visit to the house once inhabited by the "Ladies of Llangollen," and he hoped they would derive some pleasure from looking at the more per-

manent relics with which these remarkable women enriched the little box in which they dwelt.

Sir W. W. WYNN, Bart., M.P., as President for the year, acknowledged the compliment, and proceeded to deliver the inaugural address. A specially interesting feature of the district to be visited during the week would be the different descriptions of castles by which it was once defended, from early British to the most recent period. Near Oswestry, he believed, they would see one of the former class, while close at hand, at Chirk, was a castle of a more recent date—one which was very much injured in the wars of the Commonwealth, but now restored, and changed from a place of warfare into a very comfortable gentleman's house. On the Dee they would probably see the very early castle at Caerwys, near Newmarket, where there is a gold mine, and from near which place a gold torque of great beauty was dug up. He hoped to procure it from South Kensington Museum as an addition to the temporary loan museum. On the morrow they would see another very early fortress at Castle Dinas Brân, and also the Abbey of Valle Crucis. The chronicles showed that the monks may have been diligent in performing their religious duties, but they also knew how to take care of themselves, and were very well informed as to good fish and the abbot's ale. Near Wrexham, in the detached portion of Flintshire, known as Maelor, might be seen Bangor-y-Coed, the site of an ancient establishment of monks, and a yet earlier city; now the buildings have disappeared. The church has been so often rebuilt as to be no longer the same, and the only trace of the city's extent is the name of "Porte," borne by the farm-houses that occupy the situations of the old gates. Within two or three miles of Bangor-y-Coed were remains of three ancient strongholds. Several sites had been suggested as that of Owen Glydwr's House. He understood it was at Llangedwyn, near the southern part of Denbighshire, and although it was now destroyed, and a modern house built on the site, he hoped many of the members would accept his invitation to visit the place on Tuesday week.

Mr. MORGAN (hon. treasurer) proposed a vote of thanks to Sir W. W. Wynn for his address, and this was carried by acclamation, renewed when Mr. G. R. Wright (hon. Congress secretary) explained that the council had accepted the invitation of the President and Lady Wynn to arrange to make an additional day's excursion at the ancient town of Oswestry, and at Sir Watkin Wynn's seat at Llangedwyn. The members then visited

PLAS NEWYDD,

A cottage *ornée*, situated on a hillside, about half a mile from the town. Here Lady Eleanor Butler and the Hon. Miss Ponsonby, known as the "Ladies of Llangollen," lived during the close of the last and earlier years of the present century, in retirement from their friends. With many eccentricities of dress and manner the ladies appeared to have earned the goodwill of all, and were frequently visited by members of the aristocracy on their way to and from Ireland, as the London and Holyhead road ran through Llangollen till Telford's day. Lady Butler died in 1829, aged 91, and Miss Ponsonby two years afterwards, aged 76, and both together, with a faithful servant, Mary Carroll, rest under one tomb in Llangollen churchyard, marked by a triangular pillar. The little house is a mass of old wood carving, both inside and without, collected from old English chests, church doors and pews, and mansions, with some choice specimens of Hindoo, Cingalese, and Chinese workmanship. The walls and ceilings of the low, dark little rooms, are veneered and wainscoted with their unique collection of woodwork; while outside and on the porch are more examples. The house now belongs to Lieut.-General Yorke, C.B., who courteously received the members, and told the simple story of the ladies' strange life of seclusion and benevolence in the principal room. The ladies had been disappointed in love, and had made a vow never to sleep out of Plas Newydd; on one occasion, however, they were on a visit to his father's at Wynnstay, and the weather was so rough that they could not be permitted to

return, and the ladies resolved, therefore, to sit up throughout the night. In this room is some sculpture in marble and ivory, and wood-turning, executed by General Yorke, also a number of relics of the ladies, and other curiosities, and the windows of the house are filled with ancient Flemish and other stained glass. In the garden in the front of the house are two octagonal thirteenth-century fonts, said to come, the one from Llangollen parish church, and the other from Valle Crucis Abbey. In the evening an inaugural public dinner was held in the Assembly-rooms, Llangollen.

TUESDAY.

On this, the first excursion day, a combination of climbing, walking, railway and carriage travelling was arranged for, and was generally enjoyed, the weather proving better than our fears, although it must be admitted that the pleasure consisted rather in the beautiful hill scenery and bracing open-air exercise than in successful archæological research, for beyond a couple of early hill-castles and a pair of fine fifteenth-century churches little actual work was accomplished.

CASTLE DINAS BRÂN.

Notwithstanding the heavy showers of the morning a considerable number of members climbed the very steep conical hill of Dinas Brân, and were rewarded for their exertions by an extensive prospect up and down the Dee valley from its summit, and of the evanescent rainbows painted on the distant hillsides to the north-west. The "castle" consists of a number of walls and arches, roughly masoned, of slates quarried from the surrounding moat, and arranged around a central oblong space. All the freestone dressings have been taken away for building purposes, and therefore no mouldings exist to suggest a date, but the characteristic pointed archways, each with the span-drel of a lower curtain wall appearing through the head of the arch, appears to give authority for fixing the period of erection within the reign of the third Henry. The long, dark, vaulted passage yet remains in a nearly perfect state, and the stones in which the grooves for the drawbridge and portcullis were cut are still set in the wall outside. Mr. LOFTUS BROCK read a paper under shelter of the remaining walls of the dwelling apartments, in which he said that the original castle must be considered as one of a series defending the valley of the Dee. Chirk, a few miles distant, is evidently a support to this, and higher up the valley, at Corwen, is another fortified post, remaining in its original condition, and not obliterated like this, by a building of antiquity, it is true, but of moderate age in relation to the original occupation of the site. All these have the peculiarity so common in Wales, commanding a view down two valleys. He was disposed to ascribe very high antiquity to the occupation of the site, by an earthen or rude stone enclosing wall, with an external ditch, probably not much larger than is now occupied by the ruined castle of 13th-century work. There was, however, no foundation for the tradition that it was the abode of the renowned Brennus, who made successful war with the Gaulish armies against the then youthful city of Rome, although the story gave some indication of the remote antiquity of the fortress. The most probable meaning of the distinctive name Brân, was from the little streamlet on the hillside. The walls of the present castle enclose a parallelogram 296ft. x 133ft., with an additional extension to the east. The entrance has been at the north-west corner, where the bases of the semicircular towers can clearly be traced. The path was carried round the hill in an ascending spiral, so as to render it almost impregnable. Traces of the drawbridge can be seen by the moat, and within was a portcullis, defending the existing circular passage, which again had holes in the roof for throwing projectiles on an enemy beneath. The keep was in the eastern projection, and was, probably, a square tower, divided from the enclosing walls by an inner block of buildings; on the east side was the large hall, and in its inner south-west angle are indications of a chimney, and there is, beside the connecting tower, a staircase in the thickness of the walls. A deep hollow on the east of the enclosure was once the basement of some demolished build-

ing, and it was to be regretted that it had never been cleared out. There were the usual stories attaching to the castle of subterranean passages of great length and extent. Many memorials of the later owners of the castle are, added the lecturer, on record. It was the seat of the Lords of Yale; the founder of Valle Crucis Abbey resided here; and later, in the reign of Henry III., its owner died here of grief and shame. The castle, like that at Chirk, at present belongs to Mr. R. Middleton Biddulph. The rough material of the walls renders it difficult to assign its date, but Mr. Brock pointed out that the mode of construction, of a rough slaty stone, with dressings of freestone, agreed almost exactly with that of Valle Crucis Abbey, and suggested it might have had the same founder—Madoc ap Grafydd Maelor. The peculiar rectangular arrangement of the plan was like the English type of castles of a still later date, forming the supposition that it was derived from a different source: but the so-called Edwardian castles owe much to those of France of contemporary date. Mr. Hartshorne has adduced evidence of a castle here having been burnt in the 10th century; and Mr. Brock asked if the fact that much of the mortar contains pieces of burnt slate did not indicate that it was a rebuilding with the *débris* of that fire? The moat around two sides is greatly filled up, and should be cleared. The members having made the circuit of the walls and moat, descended to Llangollen station, and proceeded by train to

WREXHAM.

There the noble church of St. Giles attracted immediate attention, as much by the graceful and octagonal turrets and the groups of pinnacles by which its lofty tower is crowned as by its cathedral-like size. As it stands it is a magnificent specimen of the Perpendicular type of church, and the carved and panelled roofs over nave and aisles, octagonal piers without break or mouldings, and spacious windows, each contribute a share to the effect of the church. Mr. Adams read a paper in the church prepared by Mr. Benjamin Ferrey, F.S.A., who has been professionally engaged in restoring the church. The church, he said, was rebuilt, with the exception of the tower, in the reign of Edward IV. The plan consists of nave, north and south aisles, and chancel. It is remarkable as one of the very few choirs of the Perpendicular period having a chancel with an apse. It originally terminated with a square end, where the chancel arch proves by the remains of its ancient tracery the old east windows to have been. The present roof to the apse is of a later period than the walls; it was probably intended to be groined. The windows and sedilia are handsome. The nave consists of six bays, and is separated from the north and south aisles by octangular pillars, carrying handsome and boldly-chamfered arches of two orders. These are singularly fine in proportion. The north and south aisles have good Perpendicular windows of four-centred arches, and are roofed in the usual low-pitched manner—they have been subject unfortunately to modern innovations. The clerestory and aisles are of later date than the arcade itself, which latter probably formed part of the earlier chancel said to have been burnt in 1457. Corbels of the earlier church are still remaining on the spandrel walls of the nave, considerably below the stone brackets of the present roof; the effect of the earlier church with its pointed roof must, in the lecturer's judgment, have been far superior to that of the present building. Further improvements are said to have been made in the time of Bishop Birkhead, 1513-18. A subsequent Bishop Parfew or Wharton resided much of his time here, and endeavoured to procure a license to remove his see, or cathedral church, to Wrexham, of which Leland wrote about the same time, that it had a "goodlie church collegiate, one of the fairest in North Wales," but there were no prebends attached to it. In Elizabeth's reign the church was enlarged by the addition of the south aisle, the roof of which is said to have been formed out of the timber of a gallery which ran along the north side. During the Commonwealth it was desecrated by being used as a prison, or a stable according to some authorities. The piscina of the Puleston chapel yet exists at the

east end of the north aisle. The external architecture of the church is of the usual Perpendicular type, having roofs of low pitch, the clerestory and aisle walls being surmounted by embattled parapets separated by buttresses and pinnacles. Inside the porch at the west end of the north aisle is the effigy of a mailed knight, probably removed from the earlier church. The recess under the apse, approached by a winding stone staircase, is somewhat novel. No doubt it was caused by the fall of the ground at the east end, to which this undercroft gives external height. The great feature of this church is the western tower, justly celebrated for its beautiful proportions and details. It is styled one of the "Seven Wonders of Wales." When it was commenced is not known, but it was completed in 1506. Amongst the numerous examples of grand Perpendicular towers which abound in Somersetshire, there are none to be compared with that of St. Giles's, Wrexham, for massiveness and good proportions. The defect in the Somersetshire and Gloucestershire towers is the overhanging character of the perforated parapets and pinnacles, giving them a light and somewhat insecure effect. This is obviated in the composition of St. Giles's Tower, where the graduated angular buttresses rise and unite with the octangular turrets at the four corners of the summit in a graceful and beautiful manner. The manner in which the lower stage is covered by traceried paneling in low relief somewhat detracts from the simple massiveness which should belong to the foundation of such a lofty structure, and it is doubtful if the faces of the buttresses would not have been better without the paneling. The subsidiary buttresses dividing the sides of the tower, containing niches still furnished with slates, are not successfully arranged. There are very few towers which can boast such a number of niches still filled with unutilized statues as that which you have just been examining.

Mr. LOFTUS BROCK drew attention to the splendid brass eagle lectern which he was glad to point out was made for and presented to this church, and not (as popular tradition asserted) brought from Valle Crucis Abbey. Mr. Bloxam described the monuments in the church, drawing special attention to that of Bishop Hugh Bellot, of Bangor, and afterwards of Chester, who is represented in a bishop's robes, with the doctor's robe and furred hood above. Only two other examples of such a combination of episcopal and academical dress exist on monuments in the United Kingdom. Some frescoes on the inner wall of the south porch Mr. Bloxam pronounced to be of the fifteenth century. It is in very good preservation, and gives in rude outline the cross, ladder, whips, and other emblems of the crucifixion. Before leaving the churchyard we glance once more at the long battlemented nave and aisle parapets, at the well-proportioned tower, and, having read the strange epitaph on the tomb of Elihu Yale, the founder of the world-celebrated Connecticut College, we pass out through the churchyard gates—themselves finished specimens of wrought iron of Queen Anne date. After luncheon at the Town Hall the members proceeded by carriage to

GRESFORD CHURCH,

Another grand edifice, chiefly rebuilt in the Perpendicular style. The mass of pinnacles and statues upon the top of the lofty tower give a rich appearance, but are too nearly of one height to be altogether satisfactory. The panelled work below, and the buttresses, with niches still occupied by statues, add greatly to the effect, and with the long unbroken ranges of clerestory and aisles, surmounted by embattled parapets, make Gresford noteworthy amongst the fine churches of the immediate vicinity. At the east end of the churchyard is an enormous yew tree, of great girth, and, presumably, of very remote antiquity. On entering the church the fine proportions and unbroken lines of nave, chancel, and aisles, are at once apparent, and the eye rests on the carved woodwork and stained glass. The roof is in one span, and affords an example of a flat yet effective treatment of the ceiled surface, by breaking it up into panels, the squareness of the intersections of principals and cross-beams being taken off by cross-

shaped applied ornaments in oak, having prolonged foliated extremities. The chancel is divided from the nave by a large screen of oak, and both this and the parcloles striking off the east ends of the aisles into chapels, are very elaborately, and, indeed, delicately carved, with free pierced parapets. The five columns supporting the arcades are not, as at Wrexham, plain octagons, but deeply fluted so as to form clustered shafts—a treatment indicative of a much earlier period of erection for these piers. The windows of the aisle-chapels and the great east window contain some ancient stained glass; that in the last-named window was repaired (and completed where destroyed) with great skill by Clayton and Bell, a few years since, when the church underwent restoration at the hands of Mr. G. E. Street, R.A. This window, which is of great size and width, is divided into seven lights by perpendicular mullions of the Perpendicular period. The superior half contains representations of the Trinity and the Virgin Mary enthroned; the lower portion is occupied by angelic and saintly figures arranged in groups of three to a light in five tiers, a portion of the "Te Deum" being inscribed under each. These are supposed to have reference to the dedication of the church, which is to All Saints. In the representation of these half-length figures, more than a hundred in number, a great deal of nearly clear glass has been employed for the faces and drapery. While this throws up the richer tints of the upper part, the result is not altogether pleasing, as the normal relative positions of light and shade are thus reversed. Still, as a whole, Gresford east window is a fine specimen of glass painting, to be borne in mind when designing in 15th century style. Beneath the chancel is an undercroft, now utilised for the storage of hot water apparatus. Mr. Loftus Brock gave an address in the church. When they drove up to it they were, no doubt, prepared to find within a fine example of one period of work, the 15th century, but a little closer inspection had already revealed that in this edifice they had preserved records in stone of the common history of a church—a small structure built at a remote period, gradually enlarged, and at last almost replaced by a much grander building. As they looked at the tower arch they could see distinct traces in the masonry of the steeple-pointed gable of a smaller building, re-used as the inner wall of the tower. The tower arch below exhibited another change of style, and showed that the base of the tower was built as it stands about 1350. Then the south aisle was thrown out and its west window had still a beautiful flowing tracery of the 14th century. Then that on the north side and the arcades and clerestories were added. About a hundred years—perhaps rather more—afterwards all these aisle windows (except that south-west one before noticed) were taken out and replaced by large four-light ones, the old mouldings and buttresses being left as witnesses of the change. Why good windows, only a century or so old, should be knocked out to make way for others of different shape is one of the problems of church history. In order to separate a ritual chancel from the nave the very fine screen was subsequently raised, and the aisle-ends were converted into chantry-chapels—that on the south being known as the Trevor, the north one as the Madox chapel. The great east window, dating from the 15th century, was one of the most magnificent in the kingdom; those in the chapels were very fine, although defective specimens of Perpendicular work, and in the small tracery lights of the aisle windows—the greater part of which had been now filled with modern glass—might be seen other fragments of old work. The peal of twelve bells in the tower were another of the "Seven Wonders of Wales," of which they had already so much. Mr. Bloxam then explained the monuments in the church. The most important is a sadly-battered figure of a knight in chain armour, placed in a recess in the south aisle. An inscription, now almost effaced, is said to have recorded it as that of Madoc, illegitimate son of Llewellyn ap Griffith, who aspired to the principedom of North Wales, and died in 1351. A mural monument of marble in the Trevor chapel at the end of the same aisle is divided into three compartments; in

the centre is a slab stating in Welsh that it is to the memory of one Trevor Trevellyn, Lord Lieutenant under Henry VIII., and that he died in 1589. The end compartments are occupied, the one by a sculptured head and bust, the other by the feet, as if of a recumbent figure partially concealed by the inscribed stone. Under the tower arch are two images of a priest and female saint said to have been brought from a church eight or ten miles away. Resuming our carriages we are driven across the river Alyn into Flintshire, to

CAERGWRLE,

A hill fortress much resembling that at Dinas Brán, visited in the morning, but set on a more isolated hill, and one withal commanding views of the city of Chester (the square tower of the cathedral looming large under the direct rays of the western sun), the Dee estuary, the tall chimney stacks, and pinnacled tower of St. Mary's-at-Mold, while behind are the modern spires of Wrexham, contrasting well with the octagonal turrets of St. Giles's to their left. Of the castle itself nothing remains, except two masses of solid masonry of great thickness and considerable height of square stones, and with wide joints of Henry II. or Henry III.'s time. Upon one of these broad walls many of the members clambered, and grouped themselves to listen to a discussion between Mr. Edlesbury, of Wrexham, and Mr. Brock, as to its age, the former suggesting a Roman origin, while the hon. secretary said he could see nothing of earlier than the Norman period, although the site, as its name, and the relics found in the neighbourhood suggested, has been occupied first by the British and then by the Romans. A paper had been prepared relative to this fortress by Mr. W. Thompson Watkin, but could not be read till a subsequent period of the Congress, owing to the lateness of the hour. We give here in its proper order an abstract. That the castle at Caergwrle was originally a Roman walled castrum, which, in mediæval times, was repaired, added to, and otherwise adapted to the necessities of the period; that it also was designed to afford protection to a Roman town, built in its immediate neighbourhood, was, he held, a now established fact; as in all other Roman stations, excavations were needed, not only to define the exact dimensions, but to throw light, by further finds of inscriptions, on its name and the nature of its garrison. From discoveries of Roman remains, including a hypocaust, bricks, inscribed tiles, and coins, made in that vicinity, it is nearly certain that it was originally erected by the 20th Legion, and that a large Roman town existed in the vicinity. As to its name in those days the author suggested that it was probably the Sandonium, said by Ravennas to have existed between Conovium and Deva (Caerleon and Chester), and immediately preceding the latter station (as if close by). Several Roman roads led from Caerwys, and can yet be traced in places through the surrounding villages. From this point the members returned by road to Wrexham, and thence by special train to Llan-gollen, where an

EVENING MEETING

was held at the Assembly Rooms; Captain Attwood Fisher in the chair. Mr. THOMAS MORGAN, F.S.A., hon. treasurer, read a paper of an historical character on "North Wales as shown on a Map of the Thirteenth Century," in which he showed how much light was thrown on the history both of England and Wales by a map drawn in the reign of Edward I. and contemporary chronicles. In a M.S. of the same century the following monastic institutions are recorded as existing in North Wales:—"Santi Asaf—Abbatia de la Pole Sanctæ Mariæ, monachi albi; de Valle Crucis, do., do., de Com, do., do., de Hudland, moniales albe. Bangor—Abbatia Abercon-wach, monachi albi; de Kemer, do., de Basingwerk, do., et de insula Heuli, do.; prioretus de Ennis enoc, monachi nigri."

Mr. J. TOM BURGESS read a paper on "Offa and Offa's Dyke," opening by remarking on the numerous footprints of our forefathers which remain on the hill-tops and in the valleys of the land, the only witnesses of a past which has no written history, and on the fact that these rude earthworks and rough mound-and-dyke

fortresses have proved more substantial and permanent memorials than more finished types of architecture. He considered it a mistake to ascribe all mounds and hill defences to an invader, for the early chieftain would naturally take the strongest and most secure position in a district, and one from which he could best defend his territory from enemies. Passing on to his more immediate subject, Mr. Burgess related Offa's life history, and showed the course of the dyke attributed to him, which can yet be traced pretty completely across one hundred miles of border country from Chepstow-on-Wye to near the estuary of the Dee. Parallel to this, at the northern end, was another similar ditch and mound known as Watt's Dyke, and separated from Offa's sometimes by 500 yards, at others by an interval of 3 miles. These converged towards the sites of the Roman cities on their route, whereas Offa reigned but a century antecedent to Alfred the Great and ages after the Roman occupation. The lecturer, therefore, argued at considerable length that the dykes were probably parts of the great system of military entrenchments, thrown up, as is well known, in all parts of England, but nearly effaced in cultivated districts. Offa probably repaired and strengthened the western dyke on the Marches, and subsequent generations gave him the credit of having designed the work.

Mr. W. DE GRAY BIRCH, F.R.S.L., followed with a paper on "The Welsh Seals of English Sovereigns."

WEDNESDAY.

On Wednesday the principal feature of the day's proceedings was the visit to Valle Crucis Abbey. We shall give further particulars next week, and meanwhile append a paper read by Mr. E. Loftus Brock.

VALLE CRUCIS ABBEY.

Mr. BROCK remarked on the beauty and seclusion of the site as in themselves suggesting that the establishment was for monks of the Cistercian order, doomed to silence except while engaged in the performance of their simple ritual, and a single half-hour's converse with each other on the Sunday. In many abbeys of this order we have little more historical record than that of the foundation and dissolution. The foundation of Valle Crucis and its date have been matters of much doubt. Dugdale, on Leland's authority, rightly ascribed the foundation to Madoc ap Griffith Maylon, Prince of Powys, and assumed that this was about A.D. 1200. We are indebted to Mr. Morris C. Jones, the hon. sec. of the Powys Land Club, for a discovery of no small importance in reference to the abbey's history. By a process of close reasoning he has demonstrated that one of the charters supposed by Dugdale to have referred to another building, is in reality the foundation charter of this abbey, granted by Madoc. Hence we learn that Valle Crucis was an offshoot from the less celebrated but parent abbey of Strata Marcella, and that a few monks from that house were the first occupants here. The charter is, unfortunately for us, undated; but the first prior's name is given as Philip. The spot was known then and later by the title of Llan Egwistle, and one of the latest extant seals of the abbey (early sixteenth century), now in the Herald's College, has this name as its legend. In 1870 Mr. de Grey Birch published for the first time two manuscripts in the Cottonian Collection at the British Museum, which had previously been scarcely noticed. The first appears to be a contemporary transcript from some central registry of foundations of almost all the Cistercian houses in Europe. The second is another transcript, in many respects confirmatory of the first, and apparently made towards the close of the first half of the thirteenth century. The second has this entry under the date 1199—"De Valle Crucis in Cambria;" but the first list under the date 1200 reads, "v. kal. Februarii abbatem de valle crucis." The old Welsh chronicle, "Brut y Tywysogion," is one of the most valuable works published by the Record Commission, teeming as it does with references to almost contemporary events and buildings, and is not yet so generally known in the Principality as it deserves to be. Under A.D. 1200 is in it the following record:—"The same year Madog, son of Graffudd Maelon, founded the monas-

tery of Llanegtwistle, near the Old Cross in Vale." We have thus, in this important entry, not only the year of the earliest record of the old name Llanegtwistle, but direct reference to the Old Cross (Ehseg's Pillar), whence comes the modern name of Vale of the Cross. The date 1199, recorded by the second Cottonian MS., probably gives the date of Prior Philip's election; the later and more precise date of the first MS. that of Madoc's charter. The abbey buildings afford a perfect model, as far as they remain, of the arrangements of a Cistercian house. The church is of the usual cruciform type, an aisleless presbytery having transepts with two chapels forming an eastern aisle to each (there has been a low square tower over the crossing), and a nave of six bays with two side aisles. The extreme length is 165ft.; length of transept from north to south, 98ft.; width of nave and aisles, 67ft. 6in.; width of chancel and of transepts, 30ft. The east and west gables are all but perfect, and the north and part of the south walls of the chancel remain, also those of the south transept, with part of the vaulting of its two chapels, and there is also left the lower portion of the walls of the north transept and of the north aisle of the nave. The south nave wall is almost perfect, but is hidden by the luxuriant ivy. The bases of the nave piers are traceable, thanks to a careful clearance of the ruins made in 1854. The east end and the transepts are designed in a severe style of First Pointed. The peculiar plaster buttresses of the east end are more curious than beautiful. The Principality is full of examples, as here, of peculiar treatment of architectural details, both in Early and Late work. The lofty eastern lancets spring from a level remarkably little above that of the pavement; over the two upper lancets is just a trace of a moulded arched label, which probably indicates the line of the boarded or vaulted presbytery ceiling. The corbel table around the presbytery and transept walls is bold and peculiar, consisting of two patterns. The west end of the chancel appears to have been covered with a sloping roof, but this would only have been prior to the erection of the central tower. The slit on the south side is from a curious little room and passage at the back of the monks' dormitory, concerning the use of which many guesses have been made. It was the sacristan's apartment, from which he could watch the perpetual light of the sanctuary at night. The high altar stood as at Fountains Abbey, from the east wall. The ambury in the south wall has a semicircular arch, and has been double. The bases of the four altars of the transept chapels are very apparent. Each has a piscina; that of the northern altar of the north transept being on a detached pillar. The remaining arches of the transepts are designed in a very severe style, and the capitals are a tradition of some building of earlier date. The three orders of the arches are simple rectangles, without even a chamfer, but the effect is excellent. In the sheltered stonework of these chapels it is observable that the whole surface of the wrought stone has been covered with a film of plastering, on which coloured decorations are still traceable here and there. This use of colour, which may also be seen at Old Cleeve, was forbidden in Cistercian houses. The doorway for the passage of the monks from their dormitory into the church, for the service of matins and vigils, remains, but the stairs are gone, and were therefore probably of wood. The remains of the piers of the central tower are of much interest. Those on the south side indicate the systematic way in which the shafts of the bearing arches were carried on corbels, in order to allow the whole of the wall surface of the piers to be free for the monks' stalls. The cracks indicate trouble for the safety of the central tower; and here, as at Furness and elsewhere, the builders had to take vigorous measures to keep it standing. The eastern bay of the nave has been walled up with solid masonry to afford greater support. The west window of the transept has been removed, and its space built up, and several other works of buttressing are very evident, including a curious reduction of the width of the east arch into the south transept. These efforts to save the tower were successful, for if Churchyard's poem be literally taken,

the tower was still erect above the ruined building in the days of Elizabeth. There is a very charming piece of Early carving below the corbel which supported the south-east arch of the tower. The north transept door has many circular mouldings rather than shafts. This is usual in Wales, but here they spring not from bases, but from a line of foliage. No trace, except part of the western wall, remains of the ritual choir; and this and the rood-loft are probably of the date of the works for the support of the tower. The base of a nave altar still remains on the south side. The broad piers of the nave are the only traces of the nave arcade, but the recent excavations have brought to light several fragments of capitals, plainly shaped rather than carved—probably they are those of the nave piers. There is evidence of the existence of the clerestory of single lancets, and a corbel or a nave principal remains, proving that it was covered by a timber roof. The west front has three windows of similar pattern. Above a small rose window in the gable is the inscription, "Adam Abbas fecit hoc opus i pace quiescat amē." The deep splays of the windows add greatly to the amount of light derived from them, and the telling design of the mouldings is worthy of careful study. The effect of what cannot be called elaborate execution is most excellent, and unlike much modern work. There is a staircase on the south angle of the nave; whether only intended for access to the roofs, or to monastic buildings, it is impossible to say, for no evidence remains. We find the whole of the conventual buildings occupying the east side of the cloister quadrangle remaining. Next the south transept is the slype, still retaining its circular barrel vault, and having its arch of opening from the cloister of very early type. Next is the chapter-house, vaulted in nine square compartments, and still further southwards was the cemetery entrance, and beyond this the common parlour. Over all these buildings extends the dormitory, 60ft. long and 22ft. wide, approached by the monks' day stairs, which still remain. It was paved with flagstones, and lighted by a series of small single-light trefoiled windows with wave mouldings. Although the walls have not been plastered, yet the windows were once rebated for glass, and there is the unusual luxury of a fireplace, with chimney of elegant design externally. At the south end of the dormitory is a small apartment opening from it, which has been covered with a pent-house roof; it was probably the sleeping apartment of the custodian of the dormitory. At the back of the dormitory fireplace is a narrow room, parallel with the former; this was probably the muniment room, while to the sacristan may be assigned another small apartment at right angles, since it communicated by a passage over the vaulting of the south transept chapels with the niche before alluded to. The cloister space has no trace of the cloister buildings, but from the position of the corbels for the roof timbers, and the absence of remains, it is probable that, as in other instances, the cloisters were formed of wood. It has sometimes been stated that all the buildings are of the same date, but a small amount of inspection will assure us that the east end is the oldest—say of a date within the first 20 years following that of the foundation; the transepts are a little later, and the west front was built about 1260. The ground floor of the conventual buildings is of the same date as the transepts, the style possibly older, but the dormitory floor is at least about 150 years later than the foundation, since to it cannot be assigned an earlier date than the middle of the 14th century. The square-headed doorways have the same flowing mouldings as the windows. At this time the arches and flowing tracery of the chapter-house were added in the olden openings. There are traces of the use of earlier stonework in the buildings. The fire-place in the muniment room has an inscription which shows that it was part of a tombstone, and the sill of a little unglazed niche looking from the room at the end of the dormitory into it has also been part of an ancient slab. The western lancet of the south transept is filled in with fifteenth-century tracery. The present rough roof of the dormitory is modern, but the water tables in the south transept gable show that it

is of the same pitch as the old one. An unusual feature is the door on the south side of the refectory, probably opened out for the passage of articles which could not be brought up the narrow day stairs. The recent excavations revealed a few geometrical tiles, but in such small numbers as to afford additional evidence of the scarcity of this mode of decoration in the churches of the Principality. They were probably imported, since the same patterns have been met with in Strata Florida Abbey and at Aston Burnall, Salop. It is a peculiarity attendant upon the demolition of Welsh abbeys that every feature of importance in the neighbouring churches is spoken of by local tradition as being a portion of the destroyed building. Thus, we hear that the roof of Llangollen Church came from Valle Crucis, but that is unlikely, since the slope of the roofs is so different. Again, the lectern at Wrexham is said to have the same origin, but it is dated 1528, and there is a record of the name of the donor. The elaborate candlebra of the fourteenth century is said to be in the Church of Llanamnon in Yale, where is also the effigy of Gruffudd ap Llewellyn ap Ynyon, brother to the Llewellyn, Bishop of St. Asaph, who was buried at Valle Crucis. Another tomb, that of Jeva of Meredydd, is said to be at Bryn Eglwys, and another (a fragment) at an old house at Pengwern, near Llangollen, is that of Gronwy ap Ierwerth. In closing, Mr. Loftus Brock pointed out that the old name of Llanegwistle pointed to the existence of a church in the valley long prior to the foundation of the monastery.

Yesterday (Thursday) a large party left Llangollen at 10 a.m. for a carriage excursion to the site of Owen Glyndwr's house, mound, and farm, and an address was given on the site by Mr. G. R. Wright (hon. Congress secretary). From thence the members proceeded to Corwen Church, and then to the little chapel of Rug, where a few remarks on its history were made by the Rev. W. Richardson. After ascending the Gaer, one of the series of ancient British encampments defending the Dee, and taking luncheon at Corwen, the members returned to Llangollen in time for an evening meeting.

To-day (Friday) visits to Dolgelly and Cymmer Abbey, Bala, the manor-house of Rhiwaldog, Palé, and Llanderfel Church are arranged for. On Saturday Denbigh Church and Castle and some churches in the vicinity are to be seen; on Monday an excursion will be made to Mostyn, Basingwerk Abbey, and Holywell; and on Tuesday the Congress closes with a visit to Oswestry and Sir W. W. Wynn's seat at Llangedwyn. We shall continue our special report next week.

A NOVELTY (?) IN CONCRETE BUILDING.

AN experiment in concrete building, mis-called a "novelty" by the *Birmingham Daily Post*, is just now being tried by Mr. Edge, architect, of Bennett's-hill, at Richmond-hill, Harborne. The materials used are gravel and lime, and the method adopted of dealing with them has been successful in an eminent degree. Some time ago Mr. Edge acquired some building sites at Richmond-hill, and found that before he could proceed with the architectural plans which he had formed, a large quantity of gravel must be removed. The existence of this large quantity of gravel led to the inquiry whether or not it might be utilised, and Mr. Edge entered upon a number of experiments in the direction of its employment in the making of concrete. The gravel consists of pebbles, red sand, and a certain quantity of marl, and it was found that if a lime concrete was to be made, the two latter constituents must be got rid of. The pebbles were accordingly washed, mixed with ground lime, which is unslaked, and then water added. The lime has an affinity for the silica of the stones, but not for the clay and earthy matter, and when the mixture described is allowed to rest for a few hours it sets into a mass much more solid than brickwork, and nearly as hard as stone. Mr. Edge is now building a house of a superior class, containing three sitting-rooms and nine bedrooms, in which the concrete plays a very important part. In order that the house may ac-

cord in style with those near it, it has a facing of red brick, but only to the thickness of 4½ in. Inside this is a wall of concrete, giving a total thickness of about 15 in. The object in the case of the present building is not so much that of cheapness as of increased substantiality, it having been found that 9 in. brick walls, in the case of several neighbouring houses, have been insufficient to keep out the damp. There is, however, no necessity for any employment of brick at all, as is shown by the construction of several interior walls of only 4½ in. in thickness; and, as will be further demonstrated in buildings yet to be erected, even in the construction of the flues the concrete is amply sufficient. So confident is Mr. Edge in the steadfastness of his material that he has not hesitated to employ it in the construction of arches for the cellar vaulting. One arch being simply a slab of concrete has 12 ft. span, and the centreing was removed in a few hours only after it was made. It is estimated that a cubic yard of the concrete work, where the gravel is on the ground, will cost 11s. 9d., the amount being made up as follows:—Washing gravel, 2s.; two bags lime, 4s. 6d.; labour, 3s. 6d.; as contrasted with 25s. to 28s. a yard for brickwork.

AMERICAN CLIFF AND CAVE DWELLINGS.

THERE have been just added to the South Kensington Museum six models (the gift of the United States Government), illustrating the cliff houses, cave dwellings, and lowland settlements met with through the district where the States of Utah, Colorado, Arizona, and New Mexico join. They are reduced to different scales, the cave dwellings being of smaller scale than the lowland dwellings, since with the former the surroundings are given, while with the latter they are not. The district, which may be called that of the San Juan basin, was surveyed in 1875, and last year some attention was paid to the ruins of ancient dwellings that had been previously noticed. The area examined was 6,000 square miles. The general aspect of the country is that of a semi-desert. Yet there is a bountiful evidence that at one time it supported a numerous population; there is scarcely a square mile in the whole 6,000 examined that would not furnish evidence of occupation by a race totally distinct from the nomadic savages who hold it now, and in every way superior to them. The ruins of the region are those of stone structures, but the remains are not so perfect as to show to what extent wood and adobe were used. The only known traces of the people besides their dwellings are flint and stone implements, tied bundles of stick, fragments of matting, pottery, and pictures cut into the walls. A number of burial-places were noted, but of the graves examined few yielded further evidences of occupation than small quantities of charcoal and bits of painted pottery. As regards the buildings, the parallelogram and the circles are the predominant forms. A greater part of the ordinary structures are square or rectangular; while attached to each group, and sometimes without indications of contiguous buildings, are the circular ruins frequently resembling towers. The models, which are coloured, give a good idea of the structures.

The parish church of Ashby-de-la-Zouch is about to be restored at a cost of £8,000, from designs by Mr. J. P. St. Aubyn.

The new Roman Catholic Chapel of the Immaculate Conception, at Stonehaven, was opened last week. Mr. Mackenzie, of Aberdeen, is the architect.

A new Board School has been opened at Bentley-with-Arksey. The cost was £2,200, including master's house. The buildings are of pressed brick, with Ancaster stone dressings, and contain one large room 46ft. by 20ft., with class-room about 15ft. square for boys and girls, and a room 22ft. by 20ft. for infants. The mixed school, with class-room, will seat 105 children, and the infant room will accommodate 50 infants. Mr. Micklethwaite, of Westminster, is the architect, and Mr. Johnson, of Doncaster, the contractor.

A new Board School, at Dudley, was opened on Monday week. Accommodation is provided for 350 children, at a cost of £5,855. Messrs. Austin, Johnson, and Hicks, of Newcastle, are the architects.

THE GRANGE, EAST SHEEN—OLD OAK CHEST AND CHAIR—
FORD'S HOSPITAL, COVENTRY.

OUR LITHOGRAPHIC ILLUSTRATIONS.

FORD'S HOSPITAL, COVENTRY.

FORD'S HOSPITAL is a timber building, erected in 1529 by the founder, William Ford. The general plan of the building is a parallelogram, having a central open court, 39ft. by 12ft., with a passage way through the building at both ends of the court; from one angle of the main parallelogram buildings extend irregularly at the back some 40 or 50 feet, with a passage the whole length on the ground floor, called "the cloisters;" this part of the building is also of timber construction and probably of the same date as the rest. The whole of the building is divided into small apartments for the inmates. The best portions are the west—or street—group and the inner court; the former is entirely in its original state, with the exception of a few of the traceried window-heads; the two small spandrels over entrance door, which are probably not even copies of the original ones, and the finials to the three gables, the present ones being evidently copies of what appear to be the original ones shown in Pugin's "Ornamental Gables." One or two of the spaces between the uprights of this front have been made into windows by glazing into the groove intended originally for the plaster filling in; these are so evidently modern that they are omitted in the drawing of this front. Part of the first-floor towards the west front is said to have been the chapel; the ceiling of this part is divided into panels by wooden ribs, and there are a few fragments of stained glass in the windows. The elaborate traceried heads of the windows throughout are cut out of a thin piece of wood, and the glazing runs up square behind the tracery. The timber framing averages about 4in. in thickness, the plaster filling in being solid and flush on both sides. The whole of the external timber work is now coated every two or three years with boiled oil.

OLD OAK TABLE AND CHAIR.

WE give an illustration of an old oak side table and chair in the possession of Mr. John Colson, architect, of Winchester. The table is very strongly framed and massive, and the two front legs are turned; it is simply but effectively carved on the top and three sides, the back being quite plain. The chair is also massive, with turned legs and knobs, and the carving is similar to that on the table. The history of them is not known as they came into Mr. Colson's possession through a country broker.

THE GRANGE, EAST SHEEN.

WE regret that the description forwarded with this illustration has been mislaid. We trust, by the courtesy of the author, to give it next week.

THE FAMINE IN MADRAS.

MR. T. B. POTTER'S interesting letter in the *Times* this week on the real cause of the occurrence of periodical famines in India contains an allegation, which, if true, is a serious one against the Indian Government. He asserts, on the authority of a resident in Madras during the last thirty years, that the old water tanks erected in bygone days by Hindu and Mohammedan rulers are insufficient for the water storage now called for by an increased population, and that the British Government, although it has kept up and enjoyed the revenue of the old ones, has erected, comparatively speaking, no new tanks or reservoirs. Mr. Bailey Denton has been showing us for years past the necessity of a more adequate means of water storage in England; but in India its neglect is attended with far more serious consequences than here. To us at home the reckless waste of water which goes on year after year, means at the worst pecuniary loss, and a measure of inconvenience seldom amounting to privation; but in India it is the real cause and foundation of the terrible misery which hundreds of thousands are now succumbing under. The cost may be heavy, but if the new Empress of India is to emulate the fame of her predecessors, her Government must at least copy their useful actions as well as imitate their pageants and titles.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society commenced on Tuesday at Cirencester under the presidency of Earl Bathurst. After the inaugural meeting the members, under the guidance of Professor A. H. Church, proceeded to the Corinium Museum, and examined the various objects of interest contained therein. The members afterwards visited the Barton, to inspect the pavement; and the site of the attack on the town by Prince Rupert in January, 1642, was pointed out. Passing along Barton-lane, the hospital dedicated to St. John, situate in Gloucester-street, in a place called the Paen, and founded by King Henry I. about 1135, was seen; after which the members proceeded by Grove-lane to inspect the remains of the town wall as far as the New Mills, whence they were taken to see the recent excavations in the new road, and thence to Mr. Brewin's pavement in Querns-lane. At six o'clock the dinner was held at the King's Head Hotel, and subsequently there was a meeting for the reading and discussion of papers. Among the papers down for reading were "Some recent Roman Finds in or near Cirencester," by Professor Church; "Local Names near Cirencester," by the Rev. G. H. Moberley; and "Notes on some Ancient Church Plate at Cirencester," by Mr. W. Cripps. On Wednesday there was an excursion, which included visits to Calmsden Wayside Cross, Chedworth Church and Roman Villa, Stowell Church and Mansion House, returning by the Foss Way, and yesterday Fairfield Church was visited.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETY.—A party of the members of this society visited the south-east portion of the county of Durham last week, the excursionists first visiting Castle Eden, where, after an inspection of the church and surrounding objects of interest, they proceeded to Hart. The weather was so utterly wretched that the excursion was not only shorn of much of its attractions, but thinned the number of visitors to a very narrow compass. There were among the party the president of the society, the Rev. Canon Greenwell, of Durham; Canon Consitt, of Gateshead; and some of the leading clergy of the cathedral city. After their visit to Hart, the company proceeded in carriages to Stranton (the parent parish of West Hartlepool), where they were conducted to the ancient parish church of All Saints by the Revs. J. Rudd, vicar, and J. B. Brynard, who pointed out the leading objects of interest, notably a "Mary" bell, of pre-Reformation date, and the very ancient register of the church, dating back 500 or 600 years. The visitors then proceeded to Hartlepool to

inspect the beautiful church of St. Hilda—one of the oldest and grandest edifices in the north of England—and afterwards partook of luncheon at the Cleveland Hotel.

MIDLAND INSTITUTE.—The last excursion of the season of the archæological section of the (Birmingham) Midland Institute was made on Thursday week, when Castle Ashby, Earls Barton, and Northampton were visited. Arriving at Castle Ashby at ten o'clock, the church was first visited. It is a structure of the 14th and 15th century, and consists of a nave, chancel, north and south aisles, north and south porches, and western tower. The north aisle is of the 14th century work, and the nave, church, and south aisle of a later period. The north porch has a very fine enriched Norman door, but no other portions of Norman work are to be met with. In the chancel floor is a very fine brass, of an ecclesiastic arrayed in a cope, and bearing on his breast a shield of arms, which identifies him as William de Evreunyn, rector at Ashby, from 1356 to 1357. At Earls Barton the great attraction was the Saxon tower of the church, one of the few remaining structures of that period. It is of four stages or stories, and has a more recent embattled parapet. The upper story has on each face five semicircular-headed openings, divided by columns formed as balusters, and at the west there is a small semicircular-headed doorway. The walls are divided into panels by projecting strips of masonry, and the whole is, perhaps, the most perfect example of Saxon work still remaining. From Earls Barton a pleasant drive brought the party to Northampton, at about three o'clock. After dinner, St. Peter's, St. Sepulchre's, and St. Giles's churches were visited. St. Peter's is a small structure, but of most interesting character, as it is nearly all of Norman work, and richly decorated, the capitals of the north and south arcade being especially noticeable, and the western tower, with its Norman circular buttresses and arcade-work, was much admired. Near St. Peter's is the site of the ancient castle, part of the outer wall of which is all that remains of what was once a large and important structure. St. Sepulchre's is one of the four round churches of England, and, like the Temple Church in London, has the circular nave of Norman, or rather Transitional work, and a later chancel and aisles, but here there is a western tower and spire of 14th century date added. The interior view, looking from the western entrance, is very fine—the massive round columns, bearing early pointed arches, of the circular nave being highly interesting. This completed the day's proceedings.

SHROPSHIRE ARCHÆOLOGICAL SOCIETY.—The inaugural excursion of the Shropshire Archæological Society was held on Monday week. Assembling at Bridgnorth, the party was first driven to "Lavingstone's Hole," which, to an ordinary observer, appears nothing more than an artificial cave, burrowed in the red sandstone, for the convenience of the occupier of the adjoining land but it is actually a specimen of the engineering skill of the soldiers of the Commonwealth. After entering the outside cave, a passage or burrow can be perceived near the roof, and this penetrates the cliff for a distance of 20 or 30 yards. The object of Cromwell's general (Lavingstone) in making this place was to undermine the castle, which had so successfully resisted the efforts of the besiegers, but on the 26th of April, 1646, Colonel Howard, finding that this mine had been driven so close to the foundation of his stronghold, discreetly surrendered. Bishop Percy's house in the Cartway, and Hermitage Hill on the opposite side of the Severn having been visited, the party drove to Morfe Forest, in which still stands an oak tree, supposed to be the same near which the wife of Roger de Montgomery met her lord on his return to England after preservation from a tempest, and persuaded him to build and endow Quatford Church. This building, which was next-visited, has been restored. It is a Norman building, and in remarkably good preservation. The chantry and "St. James," formerly a priory, having been inspected, the party returned to Bridgnorth, and paid a flying visit to the churches of St. Leonard and St. Mary.

FORCE OF WIND.

THE disasters caused by storms on land are of such frequent occurrence, and so extensive in their effects, that it may be safely affirmed that there is hardly any power in nature more injurious to the works of the builder than the force which is developed by currents of air set in rapid motion. This fact was fully admitted by Tiedgold, who, in calculating the strength of the timbers of roofs, considered that the pressure of the wind produced a greater strain than all the other forces to which they were subjected. Lofty towers, spires, and chimneys are not unfrequently overturned, or severely damaged by the fury of the wind; and, indeed, whenever a gale blows with more than ordinary violence we invariably hear of a large number of accidents having occurred to roofs, chimneys, or other exposed buildings. It is therefore of great importance that the builder should be well informed as to the pressure produced by the wind, so as to be able to determine beforehand whether his structure is capable of withstanding its tremendous power. In the present article we propose to show how the pressure of the wind on various kinds of buildings can be estimated, as well as to explain the principles which ought to regulate the construction of such works as are likely to be exposed to its violence.

There can be no doubt that the velocity of the wind is much greater at a considerable height above the ground than it is at the surface, the irregularities of which offer great resistance to its motion, and tend to retard its speed. Just as in the case of a stream of water, whose velocity is always found to be much less near the bottom than it is at the surface. This difference, however, is less in currents having high rates of velocity than in those moving sluggishly; and where the stream is very rapid the velocity at the bottom is about four-fifths of that at the surface. Considering, then, that a gale of wind resembles, in this respect, a stream of water, we may take the velocity at the base of a high tower, or chimney, standing in an exposed situation, as four-fifths of the velocity at its summit. Let A B (Fig. 1) represent the height of the building from the ground, B C the velocity of a high wind at the summit; A D equal to four-fifths of B C represents the velocity at the ground; then by drawing the line, D C, the velocities at any other points, a, c, e, can be represented by the ordinates, ab, cd, ef.

Scientific investigation has shown that the pressure produced by the wind on any plane surface exposed to its direct action is directly proportional to the area of that surface, and varies as the square of the velocity with which the current is moving; although it appears probable that in very violent storms the force increases in a somewhat greater ratio than this. We shall, however, at present assume the pressure of the wind to be proportional to the square of the velocity with which it strikes on a flat surface, as this is undoubtedly true for all ordinary rates of speed. If, then, we take the length, A E (Fig. 1) to represent the square of the number of units in the length A D, a p the square of a b, B F that of B C, the pressures produced by the velocities at different heights will be represented by the several ordinates of the parabolic arc, E F. In the case of a tower having the same width throughout its entire height, the pressures at the several points, A, a, c, e, B, will be proportional to the numbers (very nearly)—

16, 18, 20, 22, 25.

The average pressure per foot of surface over each of the four divisions will be nearly in proportion to the numbers

17, 19, 21, 23.

If we suppose the pressure at the summit to be 50lb. per square foot, that at the base will be 32lb., and the average pressures per foot on the four divisions will be in lbs.,

34, 38, 42, 47.

Taking the height of the tower as 100ft., and its width as 10ft., the area of each division will be 250 square feet, and the total pressure on the surface will be nearly equal to

$$250 (34 + 38 + 42 + 47) \text{ lbs.}$$

$$\text{or, } 40,500 \text{ lbs.,}$$

that is, 40,500lbs. per square foot on an average over the whole surface. To calculate the effect of this pressure in tending to overturn the tower about its base we must find the height, AG, of the centre of gravity of the figure, ABFE, at which the resultant of all the pressures will act. By geometry we find that AG is to BG very nearly in the ratio of 54 to 46; so that in a tower 100ft. high the moment of the pressure tending to overturn it will be

$$40,500 \times 54.$$

The tower being 10ft. wide its weight will have a leverage of 5ft. to resist the above force; if, then, W represents the minimum weight of the tower which will just suffice to prevent its being overturned by the wind, we can calculate the value which must be given to W from the equation

$$W \times 5 = 40,500 \times 54$$

which gives $W = 437,400 \text{ lbs.}$
 $= 3,905 \text{ cwt.}$

The average weight per foot of height of the tower must therefore be at least 39 cwt., and consequently walls of an average thickness of one brick and a half would just suffice to prevent its being overturned by the greatest force that the wind would ever be likely to exert upon it.

The effect of the wind is frequently seen in the lofty chimney stacks of old houses, which are bent out of the upright owing to a want of proper precautions having been taken in building them of sufficient thickness to resist the long-continued pressure of the wind. Suppose a stack to rise 20ft. clear of a roof, the pressure in this case may be taken as acting uniformly over the whole surface, and if the wall is solid brickwork its weight per cubic foot is about 112lb. Putting x for the thickness to be found, then the total weight for every foot of width of the stack in lbs. is

$$112 \times 20 \times x, \text{ or, } 2,240 x.$$

This weight acts vertically at a distance equal to half x from the outer edge, so that its moment about the outer edge is

$$2240 x \frac{x}{2} \text{ or, } 1120 x^2.$$

And the moment of the pressure of the wind at 50lb. per square foot is

$$50 \times 20 \times 10, \text{ or, } 10,000.$$

Hence, by equating these two moments we obtain

$$x^2 = 9, \text{ very nearly,}$$

$$\text{or, } x = 3 \text{ ft.};$$

so that the thickness required must be at least 3ft. in order to prevent the wall from being blown over. As, however, the chimney stack is hollow, and only about half the weight of a solid wall, we must take 56lb. as the weight per cubic foot, and this gives

$$x^2 = 18, \text{ or, } x = 4 \frac{1}{4} \text{ ft.}$$

The minimum thickness of a hollow chimney

stack 20ft. high must therefore be 4 1/4 ft. in order to prevent its being overturned by a pressure of 50lb. on the square foot. If the height of the stack is only half the above, or 10ft., the strength of the wall must not be also reduced one-half, for the thicknesses must be in proportion to the square root of the height; so that if x^2 is 18 when the height is 20ft., then x^2 must be 9 when the height is 10ft., or the thickness x must be 3ft.; and when the height is only 5ft. the thickness should be a little over 2ft. The rule for the thickness may be expressed as follows: If we put h for the height, x for the thickness, w for the weight in lbs. per cubic foot of the wall, f for the pressure of wind per square foot in lbs., the minimum value of x for a wall of any height and weight may be determined from the equation—

$$x^2 = \frac{f h}{w}$$

extracting the square root of the quantity on the right hand will give the required thickness (supposed uniform) of the wall or chimney stack whose height and weight are given. The width of the wall need not be taken into consideration, provided the weight per cubic foot is nearly the same in all parts. Taking f as 50lb. and w as 112lb., then the minimum thickness, x , of a solid wall of height, h , will be

$$x = \frac{2}{3} \sqrt{h}$$

For a hollow wall, whose average height per cubic foot is only 56lb., the minimum thickness, x , for a given height, h , will be very nearly $x = \sqrt{h}$.

The force of wind was investigated by the celebrated engineer, Smeaton, who found by taking an average of several experiments, that a wind blowing with a velocity of 35 miles an hour produced a pressure of 6lb. per square foot on a flat surface exposed to its direct action. Consequently, as the pressure varies in proportion to the square of the velocity, a current of air moving at twice the above rate, or 70 miles an hour, produces a pressure four times as great, that is to say of 24lb. per square foot. From this we can find the pressure produced by currents of any given velocity; for if v is the rate per hour, x the pressure produced by the rate v , then from the above rule we get

$$35^2 : v^2 :: 6 : x$$

$$\text{or, } x = \frac{v^2}{200}, \text{ very nearly.}$$

The following table shows the pressure per square foot on a plane perpendicular to the direction of the wind, for different velocities, as calculated by this formula:—

Vel. of Wind per hour, in miles.	Pressure per sq. ft. in lb. av.
10	1/2
20	2
30	4 1/2
40	8
50	12 1/2
60	18
70	24 1/2
80	32
90	40 1/2
100	50

Except in very exposed situations, or at a great height above the ground, the velocity of wind in this country never exceeds 70 miles an hour, giving a pressure of about 24lb. per square foot; and if this is taken as the force at the top of a high building, the velocity at its base may be calculated as four-fifths of 70, or 56 miles an hour, and the pressure at 15 1/2 lb. When, however, there are no obstructions to lessen the velocity of the wind and deaden its force, it often blows in sudden gusts upon a building, and thereby produces the effect of a battering-ram, which greatly increases the strain on the structure. For example, if a

wind which has been blowing at 40 miles an hour, and pressing with a force of 8lb. on the square foot, is suddenly increased in speed to 80 miles an hour, the pressure at once rises to 32lb. per foot, in which case a blow equal to 24lb. per foot of surface is given to the building, in addition to the former pressure of 8lb. Such a force would be equivalent to a steady and continued pressure of 50lb. per foot, which is the amount that all buildings in an exposed situations must be calculated to sustain.

Roofs of steep pitch surmounting lofty buildings are peculiarly liable to be strained by the wind. If we consider the wind to move in a horizontal direction, and to exert a uniform pressure over the whole surface, we cannot but see that the angle of inclination of a roof materially affects the pressure it sustains from the wind; although Tredgold and other writers on the strength of roof timbers have generally neglected to consider the difference which this makes, and have taken one fixed value for the pressure of the wind per foot of surface whatever may be the angle of inclination of the roof. A little consideration, however, of the subject by aid of the mechanical principle of the resolution of forces, will show that this method gives very erroneous results. For in a roof of low angle the pressure of the wind is hardly appreciable, whilst in one of high pitch it is nearly as great as that against a vertical wall. Suppose A B (Fig. 2) to represent the slope of a roof making the angle θ with the horizontal line, A D, and let F P be the direction of the wind at any point, P, moving with a velocity v ; this velocity resolved in the direction of P O, perpendicular to A B, is $v \sin. \theta$. And since the pressure is as the square of the velocity, we have, by the previous formula, pressure per square foot perpendicular to A B equals

$$\frac{v^2 \sin^2. \theta}{200}$$

In order, then, to find the pressure perpendicular to the surface of a roof of any pitch for any velocity of wind, we must multiply the pressure given in the previous table by the square of the sine of the angle B A D. If the pitch is 30° the sine is $\frac{3}{4}$, and its square $\frac{9}{16}$, so that when the horizontal pressure is 50lb. per foot, the perpendicular pressure in this case is $\frac{9}{16}$ or 12 $\frac{1}{2}$ lb. But in a roof of twice that pitch, or 60° , the square of the sine is $\frac{3}{4}$, so that the pressure on the roof is three times as great, or 37 $\frac{1}{2}$ lb. On the other hand, with a roof of 15° pitch, the pressure is only one-fourth what it is on one of 30° , or about 3lb. per foot. The following table will show at a glance what is the pressure at right angles to the surface of a roof for every superficial foot, according to the angle of its inclination to the horizontal, the wind being supposed to blow horizontally with a force of 50lb. per foot on a vertical surface.

Pitch of roof in degrees.	Pressure of wind per ft. in lb. av.
10	1 $\frac{1}{2}$
15	3 $\frac{1}{2}$
20	6
25	9
30	12 $\frac{1}{2}$
35	16 $\frac{1}{2}$
40	20 $\frac{1}{2}$
45	25
50	30
55	33 $\frac{1}{2}$
60	37 $\frac{1}{2}$
65	41
70	44
75	46 $\frac{1}{2}$

It will be seen from the figures in the above table that the force of 40lb. per foot, which is given by Tredgold as the pressure on a roof surface, is much too great for the roofs of low pitch, which he advocates, and

for which the strength of his timbers are calculated. In estimating the effect of the wind on a roof of high pitch, it must be borne in mind that the pressure can be only on one side at a time, and that there is no counterbalancing force on the opposite side. From this circumstance it arises that a far greater strain is produced upon the trusses than if the same load pressed on both sides of the roof at once.

Hitherto we have considered the pressure produced by the wind upon planes or flat surfaces only: we will now extend our inquiry to the case of a cylindrical surface, and since the pressure thereon must vary at every point, it will be necessary to call to our aid the processes of the integral calculus.

Let A P B (Fig. 3) represent a quarter of the plan of a cylindrical tower on which the wind acts horizontally at any point, P, in the direction, F P, where the radius, O P, makes the angle, θ , with the direction of the wind, supposed to be parallel to F P all over the surface of the tower. The velocity resolved in the direction of P O, or perpendicular to the tangent at P, is $v \cos. \theta$, and the pressure at P is proportional to $v^2 \cos^2 \theta$. Now, the only part of this pressure which tends to overturn the tower is the resolved part in the direction P p, which is found by multiplying the pressure down P O by the cosine of θ , so that the force in P p is proportional to $\cos^3 \theta$ for any given velocity. The pressure on any small arc, P Q, is to that on the corresponding part of the radius p q, as $r \cdot d\theta \cdot \cos^3 \theta$ is to $dr \cdot d\theta$ and dr being the differentials of the angle and the radius respectively. Therefore, for the whole quadrant, A B, the pressure on the ring is to that on the radius, as

$$\int r \cos^3 \theta \cdot d\theta \quad : \quad \int dr$$

These integrals, taken between the limits 0° and 90° for the angle, give us the ratio of $\frac{2}{3} : 1$, or $2 : 3$

Therefore, if there are two towers equal in height and diameter, one being square and the other cylindrical, the pressure sustained by the former is to that borne by the latter in the proportion of 3 to 2, the wind blowing horizontally with equal velocity on each, and its direction being perpendicular to one side of the square tower. If then we suppose the utmost pressure which the side of the square tower will have to sustain, to be 40lb. per square foot on an average over the whole surface, the pressure on the cylindrical one will be 27lb. for every foot superficial in a vertical section taken on a diameter of the circle. The weight, however, of the circular tower is less than that of the square one in the ratio of 11 to 14, if the walls are of the same thickness in each case. If the tower 100ft. high and 10ft. diameter, mentioned above, were circular instead of being square, the pressure tending to overturn it would be 27,000lb., and its minimum weight must average 26 cwt. per foot of height; so that, in order to offer equal resistance to the overturning force, the thickness of the walls must be about the same in the round as in the square tower. It has been stated by Rankine and other writers that the pressure on a cylindrical tower is only half that on a square one of equal diameter. This, however, gives too low an estimate of the force which the former has to sustain, the proportion of 2 to 3 being the one that should be adopted. This result shows that it is much more economical to build a tall chimney circular on plan than square, as a saving of one-third of the material can thereby be effected.

The principles which have been here laid down will serve as a guide to the solution of all problems relating to the pressure of the wind on buildings; but it will generally be found necessary to consider each

particular case according to the circumstances under which it may be placed, as a slight variation in these may materially affect the conditions of the problem.

ANTIQUE ART, ITS RESTORATION AND THE WORK OF TO-DAY.

WHEN we but glance at the all but infinite number of books and treatises and fly-sheets that have been written on the subject of Fine Art, it would seem to be all but impossible to propound another, or at least a new thought about it. Yet, surprising as it may seem, there is, indeed, all but a very beginning again, and all over again, to be made in the future, if not in the immediate present. Let any one without prejudice, or a foregone conclusion about the matter, attentively look into and study almost any work of the distant past, and then try and find out, as well as he can, the *modus operandi* of its production, and do this without, as we say, any previous theory about it drawn, unconsciously perhaps, from the to-day's method of work, and then let him go through the same process with any well-known and accepted modern artwork, just fresh from the hands of the workmen. No art-study, no amount of reading, can be more instructive than this. And what do we find universally, and with hardly an exception, in either case? First, in the old Art, whatever it may happen to be, or in whatever nationalised style, we may always detect the hand-work of the individual workman, or artist, which ever word the reader thinks most closely descriptive; while in the modern work the result is found, and known to be the result, more or less, of combination, the individual all but disappearing in the very number and even capacity of those who have helped him and wrought with him.

We might here go into some of the causes of this strange difference between the ways of work of the older world, and those of the work of to-day. In the past, "machinery" had little or no existence, and what is far more than this, even the methods of work which machinery always necessitates and brings with it, was never even thought of, and the consequence of this absence of mechanical means was, that the individual artist or workman was to be found at the work—whatever that might be—in "The Gladiator," a mosaic, a capital of a column, or a simple patera, or in even the mouldings on a humble monument. It would be a curious thing to go minutely and in detail into the process of production of some famous work of the past, and then into the processes now in vogue for producing the very same work, and one destined for the like place, use, and intent. For are not, after all, the same things needful in all ages of the world, and in all places, and among all nationalities? St. Paul's, to wit, has now to be "decorated," and made a picture of, and be thus compelled to illustrate itself. So had the Sistine Chapel, and Ninevite Palace chambers, and the Vatican galleries, and not a few antique chancels, and even vaults. All know how Michael Angelo tried to get assistance during the painting of his chapel ceiling, and how he failed. And all know how it is proposed to accomplish the work of mosaic decoration in the domical vault of St. Paul's. "Combination" of art-power, whatever it may be under competent supervision, is to do this work. How? we might ask.

Let us take, as another instance of the *modus operandi* of the past and antique ways of work, any one of the famous Greek temples, models of work every way, and glance but for a moment at the way in which the ornamental details—to confine ourselves for the moment to that portion of the work—were executed—the world-renowned

sculpture, as seen in the Metopes and Frieze. Take any one of the Metopes at haphazard, as they are now to be seen under not a few disadvantages, by the way, in the British Museum. No very deep insight into art is needed to see, almost at a glance, that this sculptured panel of Centaur and man is the work, and the sole work, of one pair of hands and one brain. It is no copy from previous forms, but a new idea, executed by the man who conceived it. Not from a drawing, by the way, but by dint of seeing and cutting into the marble block itself—the knowing what to do, and how. What the great sculptor saw in his mind's eye, that he could bring to his fingers' ends, and we here see the results of it, just precisely in the same way as in a written poem we see into the thoughts of the writer of it. No example that could be cited can be better than this of the Parthenon prize, from the simple fact, hardly as yet noticed, that it is not all of it by one man, by Phidias himself, but others have helped him; not, however, to do his work, but their own. The "restorations," by the way, even here, are a fearful hindrance to a thorough insight into this. The student should have to do with *bonâ fide* work only.

Now, modern ways of work are the very reverse of this. The command of powerful machinery, capable of doing so much—indeed, almost everything in and about a building; the being able to buy anything required ready made, needing then only to be fixed, no one knowing who made it; and, more than all, as we have just noted, the mode and tone of work which such easy ways of getting over work and difficulties all but necessitates; and the constant activity of that "division of labour" which has made of the modern world what it now is—all go to make of the art of the day a triumph of mechanical skill and miracle of quick work. Nay, the artist himself, in spite of himself, grows mechanical in his movements; and his very mind, instead of guiding his hands, and thus moulding the work, follows the lead of the mechanism always about him, and all but waits for its guidance. What is the power of the machinery and quality of the combination of assistance? is the first question. Can it all do the work? Then the question, What is the work? In the antique art the subject came first, and then the all but accidental art power of the time, and man followed to do the work, as may be so plainly seen in the Greek art, and especially so if followed historically. Other questions come in here; but our immediate purpose is simply to note roughly how different the artistic action of the present is from that of the past. Which of the two is the best is another question, and needing further analysis.

If there be any accuracy in this distinction between the way of work in the past and the way of work in vogue all round us, what is to be said or can be said on that vital subject of the restoration of past art? If the older art got its vital strength and vigour and attractiveness from the very fact of its being the product of individual artistic effort, not capable of repetition, even by those contemporary with it, what can be said really in favour of such being now-a-days attempted? Mechanically produced, art may be restored by the same means that produced it, for "individuality" is absent. But vital and living art can be produced only once—to live as long as the material out of which it is composed, but no longer. Well-intentioned, as so much of the restoration accomplished has been, it is melancholy to think of how much has been necessarily lost by the process; how much has vanished to return no more. Let it be noted here, too—and it is not a little important to note it, that mere constructional repairs are not restorations but simple

additions. A necessary new corner-stone is an addition; and as time does its work it is now and then without doubt a necessity. Much has been made of this, but there is really no force at all in it. Nay, the very antique look and poetic impression of a fine work is hardly injured by it, as it must needs speak for itself, and contrast with all that is round it. But how many new corner-stones there are which have killed an antique structure outright!

There is a very curious aspect of the Restoration question which may be new even to those who have given it some more than ordinary thought. It is all but an obvious one; it is, and it ought not to be forgotten, that it is quite modern in idea, and of to-day and of this present generation. In the last generation, to go no further back, any alteration or addition made to a cathedral or a church was simply either a taking away of something or the making some addition to it, and no attempt was made to touch the old work itself. A new monument, in whatever style of art, was let into the walling without a thought of restoring the surrounding surfaces, whatever that may happen to have been; so that, incongruous as things so often were, you could not lose the idea of the "antiquity" in the structure. The old idea of the place still remained, however new and modern the fresh work put up. Age or antiquity in a building hardly admits of definition; it is a thing of poetic feeling and sentiment, adding infinitely to the art as art. They of the last century, to do our forefathers justice, did not disturb this, though they did do so much mischief. As an illustration, many, doubtless, will recollect the Temple Church, with its low Norman doorway, blackened by age, and the cave-like aspect of the building itself, even the "whitewash" not killing the idea of the place. It was an antique, like a mutilated statue, with the idea of age and time visibly imprinted on it. If it be an advantage and an improvement to get rid of all this, no one surely has any reason here to complain. The church of the "old" Templars is most completely and utterly gone; and another church of the Templars—the one at Dover—equally so.

So very much might be here added that it is not a little difficult to see how to choose or best to add further illustration; for the more this momentous subject is thought about and analysed, the wider and fuller does it grow. From the widest aspects of art, and the broadest possible views, we must needs descend to minute details and to individual artists and workers. May we therefore end with a memorial word on an artist worker just passed away from us—Digby Wyatt? He did a great deal of active work, that is certain, in the way of general direction, and in the guidance of others, and found much help in the work he accomplished, and so fitted himself, as was needful, into the immediate present of things artistic. But it must needs be in the very nature of art that he, as other art-workmen, must be judged by the work he actually and personally accomplished. He was no mere director of the art labour of other men; he worked himself, and was not a little skilful as a colourist, and with a fine eye for colour. We often thought that enduring fame might have well come of his pursuit of this difficult and special work. As it was, he did do a little, but surely not enough. We once asked him whether he thought, if but a drawing of his faded, he himself could in after years restore it to its first state? He said "No." C. B. A.

A new Wesleyan chapel was opened last week at Northampton. Mr. S. J. Newman, of that town, is the architect, and Messrs. Green Bros. the builders. The style is Gothic, and the materials red pressed bricks, with cement pointings and Bath stone dressings.

Building Intelligence.

ARMLEY.—The new church of St. Bartholomew, Armley, near Leeds, was consecrated last week. The edifice is not yet complete, the porches, western turrets, upper portion of the tower, and choir vestry being yet incomplete, while the choir stalls, gas fittings, and doors are only temporary. The plan is that of a Latin cross, consisting of a nave six bays in length, with north and south aisles, transepts, and sanctuary, with roofs of equal height, and a massive tower at the intersection. The church is built of local sandstone, and faced internally with limestone from the Ancaster quarries. The piers in the nave and the detached shafts are of Green Moor stone. The sanctuary is apsidal, and contains a reredos of alabaster marble and Caen stone, by Messrs. Earp, with paintings on tiles by Messrs. Powell. The length of the church is 167ft., the width across transept 67ft., and the height of the tower 153ft. Mr. Henry Walker and Mr. Joseph Athron, of Leeds, are the joint architects.

BRADFORD.—On Tuesday the new Liberal Club at Bradford was opened. The premises are part of a block of new buildings on one side of a new street, called Bank-street, between Kirkgate and Hustlergate, in the very centre of the town, and in the immediate vicinity of the Exchange and the various local banks. The building is four stories in height, and has frontages to Bank-street, Hustlergate, and Queensgate. The ground floor is set apart for a bank and four shops, and the three floors above will constitute the premises of the club. The style is Italian. The principal entrance is through a broad stone staircase, 20ft. square, from Bank-street. On each floor are suites of spacious rooms, adapted for all purposes of the club. The kitchen and the manager's servants' apartments are on the third floor. The premises have been erected from the designs of Messrs. Lockwood and Mawson, architects, Bradford and London. The enterprise is that of a joint-stock company, of which Mr. Titus Salt is the chairman, and the expenditure incurred is not less than £46,000. The cost of the building is £21,000.

BRIDLINGTON PRIORY.—The partial restoration of the old priory at Bridlington, said to have been founded in 1096 for canons regular of the Order of St. Augustine, by Walter de Gaunt, grand nephew of William the Conqueror, is being attempted, and some £12,500 has been raised in this increasingly popular watering-place and its neighbourhood. To restore the eastern parts of the edifice and the central tower would require £150,000, but the intention is to add shapeliness and beauty to what remains and to run up the two western towers. The history of the building is interesting. After the plunder of Whitby Abbey by the Danes it was fortified with walls and ditches, and its defences were further increased about the end of the fourteenth century—a massive gateway in the Pointed style, upwards of 100 yards westward of the church still remaining. In the sixteenth century it must have been a building of unusual magnificence. The length of the nave was 188ft., its breadth 72ft., its height 90ft., length of the choir about 140ft., length of transepts after 160ft. Not a vestige of chancel or transepts is now visible, and the central and two western towers have likewise disappeared. The principal entrance is by a pointed arch surmounted by a crocketed pediment, while on the north side is a beautiful porch much dilapidated, belonging to the fourteenth century. The western front is little less than a ruin, the north tower has no roof, and is blocked off from the interior by a hideous wall, the tower windows are built up with brick, and the stonework insecure.

BRISTOL.—A new Congregational church at Sneyd-park, Bristol, intended to accommodate about 300 persons in the nave and transepts is now in course of erection by Messrs. Cowlin and Son, contractors, under the superintendence of the architect, Mr. Stuart Colman. The plan is in the form of a cross, with ambulatories in the place of aisles. The transepts are slightly raised above the nave level, and have freestone parapets at the

junction with the cross. Local sandstone rangework, of a yellow hue, is used for the external facing of the walls, and large stones of the same material form the quoins throughout. Bath stone serves for all tracery and moulded work.

IPSWICH.—The church of St. Matthew, Ipswich, has been enlarged at a cost of £1,245, under the direction of Mr. G. Gilbert Scott, M.A. Mr. Henry Luff, of Ipswich, was the builder. The enlargement consists in the extension of the north aisle to the same width as the south, by which means accommodation is provided for some 200 additional hearers, and the church now affords accommodation for between 1,000 and 1,100. Externally the walls are of rubble, faced with rough flints with white stone dressings. The style of the new aisle, like the rest of the church, is Perpendicular, and the stonework of the old windows and north door has been restored and used. In the west wall of the new aisle is a handsome five-light window, whilst in the east wall is a new two-light window filled with stained glass. The roof is open and of plain oak timber.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. This week's number contains articles on Chemists and Druggists, Homogeneous Sewers, The Water Supply of London, The Present Position of State Medicine in England, Distemper in Dogs and Typhoid Fever, Mr. Lawson's Talk on Hospital Mortality, The Approaching Congress of the Sanitary Institute of Great Britain, Warming and Softening Water, The Ventilation of Sewers at York, Geography of Consumption in Devon, The Heavy Infantile Mortality at Macclesfield, Underground Water, The Report of the Society of Arts on the Recent Health and Sewage of Towns Conference, New Provisional Orders, Public Health Reports, Water Supply, Correspondence, Public Health Patents, The Editor's Table, Gleanings, &c. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for insertion of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisements inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (viz. Southampton), £1 6s. 6d., to any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 10d. each, the postage charged being 6d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—A. E. J.

BUILDER. (You have a claim for tendering under the circumstances.)—Pupil. (Apply to the secretary of the R.L.B.A. Our own pages will also supply you with the requisite information.)

ARCHITECTURAL SCIENCE CLASS.—Aubrey. (We are glad to have your expression of approval.)—E. F., A. L. B., and others. (It is our intention to continue this class in another course of study, seeing it has met with such approval. The class commenced at the beginning of last year.)—B. (The back numbers may be obtained by application.)—Attneave. (Thanks for your good wishes; your suggestion shall be borne in mind.)

"**BUILDING NEWS**" **DESIGNING CLUB.**—L. J. H. (This will recommence next week, when the new subjects will be given.)—Fred. F. Perkins. (Next week the work of the club will recommence, when we shall republish the conditions.)—Fleur-de-lis. (Your suggestion shall receive consideration.)—McClhin. (We shall be able to reply to your question after it is seen how the work proceeds on its recommencement.)

Correspondence.

TEWKESBURY ABBEY.

To the Editor of the BUILDING NEWS.

SIR,—I have read with much interest the able paper on Tewkesbury Abbey in your last number.

The Austin Canons of Oxford and Bristol built an aislelike Lady Chapel eastward of the transept on the north side. The Benedictines of Canterbury erected a smaller chapel at the east side of the transept (Wimborne, a secular church, had also the Lady altar in the transept); but at Bury St. Edmund's, Peterborough, and Ely, where external parish churches existed, their Lady Chapel was a large parallel chapel northward of the presbytery, in a position which more nearly corresponds with that of the building under discussion at Tewkesbury. At Glastonbury and Durham the Lady Chapel was at the west end of the nave. But in every case the major ecclesia was the minster proper (as at Chichester, the term High Church is not extinct to this day), and the majus altare its high altar. There were occasionally more than one Lady altar, as at St. Alban's and Chichester (the latter a secular church), but it will be remembered that the choir, whether monastic or secular, was always enclosed, and with due precaution against any interruption of the choir services circulation was permitted to the laity round the aisles, in order to give them access to the lesser chapels and low altars, and especially to the great shrines of patron saints where they existed. The matin mass of the laity was said at 5 A.M. in summer, and at 6 in winter, and probably was the most frequented, for so late as in the seventeenth century we find a relic of the custom in the provision for an early morning service by Bishop Hacket in Lichfield Cathedral.

The erection of large eastern chapels of St. Mary is, no doubt, due to certain doctrinal developments in the thirteenth century; but such adjuncts existed at an earlier period—for instance, at Chichester, where Bishop Gilbert extended the original Norman building in the Decorated period.

The beautiful coronal of chapels at Tewkesbury had its parallel in the Cistercian church of Croxden; and its germ in budding chapels—usually three—might be traced at Pershore, Bury, Leominster, and Norwich, like tentative approaches to an imitation of French arrangement.

The accommodation of the laity in conventual churches was not limited to a portion of the nave. At Romsey, on the exterior of the north aisle of the nave, into which the nuns' choir was extended, a parallel parish church was built and served by prebendary chaplains. At Boxgrove, which had only a single aisle in the nave, the monks erected two screened galleries in the transept, like a huge wooden triforium. At Chester an entire wing of the transept at the south was shut off for the accommodation of the people, whilst at Durham the sermon was preached in the women's chapel of the Galilee.

My present object, however, is to direct attention to the rich illustrations of historic architecture which are stored up in the wills contained in the Archbishop's Library of Lambeth, and at Somerset House, where the amiable and efficient custodians are ever ready to afford aid to students, who must give laborious days to a continuous and patient research. In a recent special inquiry on a particular subject—Chichester Cathedral—when I had no time to take discursive notes, I met with several important matters in connection with the foundation of chantries at Tewkesbury, and also information with regard to Hereford. The ecclesiology of London might be re-written with advantage; our present ignorance would soon be tested by even cursory reference to these mines of fresh lore. The Record Office has also its riches, for I found a complete enumeration of the whole range of the conventual buildings of Malmesbury (where the Lady Chapel, I find, was a transverse eastern structure), as built by the abbot

of the period, which I have embodied in a small independent memoir, which will be ready within a short time.—I am, &c.,

MACKENZIE E. C. WALCOTT.

A DOMESTIC DRAMA IN THREE ACTS.

By "CLAMANS IN DESERTO."

SIR,—The letter of "Clamans in Deserto" on the subject of Architects and Quantities, which appeared in your issue of the 3rd inst., has been well replied to in the succeeding numbers, but there is in it a point which appears to me to have been overlooked. I think that the whole matter might take the form of a stirring dramatic incident with the following as the leading idea, the filling up to be written by those architects who are not able to take out their own quantities.

ACT I.—A large public building has to be erected—the architect employed is a Fellow of the Institute, complying with the abominable rule of not taking out his own quantities. The "promoters" wish for an estimate from him of the probable cost; the broad path of cubing which leads to destruction is brought into play; he reports the result—afterwards a wretched thief, called a quantity surveyor, is engaged. He carefully takes into account the whole of the works required to be done—no more nor less, furnishes his bills, and tenders are obtained, based thereon; the lowest tender is considerably above the architect's estimate, proving the swindling propensities of the quantity surveyor. The work is done, the architect is ruined, and the curtain falls, showing him dying in a mad-house.

ACT II.—A few years are supposed to elapse; soot and dust have played their part—the public building requires repainting. The "promoters," with the caution before them of employing a Fellow of the Institute, engage the services of a pure though youthful architect. The original "painter's bill" is exhumed, and a copy supplied to the new and entirely untried builders. The tenders arrive—the excessive lowest astound the "promoters," but the work is ordered to be done; and, what is more, it is paid for. This crowning incident, accompanied by a banquet of the "promoters," terminates Act II. Architect No. 2 being ruined as No. 1, and the curtain falls with his body on the stage, just brought from the paddle-wheel of a Thames steamboat.

ACT III.—The "painter's bill," of Act II., fell into the hands of a firm starting with all the freshness of youth, with Cubitt, Lucas, and George Smith, straight before them as a goal of ambition. They have landed this important work—they have ascertained how much paint and varnish will be required to comply with the covenants of the original "bill"—they have rushed to the manufacturer, ordered the ascertained quantity, and have returned to their hearths happy and serene. The paint and varnish are delivered, a foreman employed, who, not knowing the description of the original bill, which provided for four or five oils because on new work, proceeds in the usual manner, and gives the now old work the usual clean and two oils; and Act III. opens with a scene of the builder's yard showing half the quantity of paint and varnish ordered and left after all the work had been done. The "confidential clerk" of the firm is now introduced—a broken-hearted man, in consequence of this surplus paint and varnish; he meets an "old friend" of a disappointed man, unburdens his bosom, and retires. The "old friend," in tears, rushes to the disappointed "one who knows," and in less than five minutes he is in a snug parlour, narrating, through the fumes of some real "Highland," the whole history of the excessive paint. Various suggestions as to the reason of such excess are made—at last it occurs to the disappointed one that the work had been done on the original bill, made by a quantity surveyor. He knows or has heard that quantity surveyor is only another appellation for "thief"—he grasps in a moment the whole course of the swindle, hastily bids adieu to the "old friend," finishes what has remained of the liquor, and writes out the drama in three acts, entitled "A Public Building; or, the Two Ruined Architects, the Youthful Builder, and the Swindling Quantity Surveyor."—I am, &c.,

WILLIAM WOODWARD.

THETFORD SCHOOL COMPETITION.

SIR.—Last autumn, when the Board advertised for plans, it was clearly stated that each competitor must guarantee that the buildings could be erected for the sum stated in his report. One of the competitors, I believe, submitted with his plans a builder's tender amounting to about £3,500, and Messrs. Coe and Robinson were prepared to undertake that they would procure a tender for less than £3,800. Now, to most of the competitors who studied the local papers, it was pretty clear that the Board could not decide whether the designs of Mr. Pearce, of Norwich, or Mr. Smith, of Thetford, should be accepted, and after sundry meetings the whole of the plans were referred to Mr. Boardman, of Norwich. This gentleman ignored the plan of the London architects, and reported in favour of the two local architects before mentioned, and now tenders have been obtained for carrying out the plans of Mr. Pearce, and a tender submitted by Messrs. Palmer and Holden, amounting to £6,126, has been accepted. It will doubtless afford satisfaction to some members of the Board that their friend has been successful, but the ratepayers should ask why the schools should cost £6,126 when Messrs. Coe and Robinson's guaranteed estimate was £3,800?—I am, &c.,

FAIR PLAY.

NEW BOARD SCHOOLS AT PLYMOUTH.

SIR.—An article, "communicated," appeared in the BUILDING NEWS of the 24th inst., commencing with these words:—"Some few months since the School Board for this town (Plymouth) expressed dissatisfaction with their architects, Messrs. Norman and Hine, &c." Who the author of this communication is we care very little to know; but we beg, in fairness to ourselves, that you will supplement it by publishing this note, and with it the subjoined copy of a letter we received from the School Board on the close of our connection with it after six years, and the erection of five large school buildings.—We are, &c.,

ALFRED NORMAN, } Architects.
JAMES HINE, }

Plymouth, August 28, 1877.

[COPY OF RESOLUTION PASSED BY THE BOARD, MAY 8TH, 1877.]

"That as the connection of Messrs. Norman and Hine with the School Board ended when the late Board went out of office, this Board, whilst fully recognising their services as architects for the last six years, are of opinion that in future it is desirable that designs for School Board schools shall be obtained after competition." Signed by the Clerk to the Board,

M. E. STRIBLEY.

A MODEL NEW CHEAP HOUSE.

SIR.—"B. X.," and such reformers as he, have the matter of imperfect houses pretty much in their own hands. Most of the defects to which he so touchingly alludes were apparent to him or any one else on a most casual look at the house, and any skilful architect or surveyor could have discovered the latent defects, and would have warned "B. X." against living in the house.

As long as people can be found who will take such houses as the one described there will be people to build them, and they will be built; but if the public has the sense to leave them empty, this class of construction will soon be abandoned, and as there cannot well be a change for the worse, things will mend.

"B. X.'s" complaint is something like that of a man who voluntarily puts his hand amongst stinging nettles, and then cries out that he is hurt, and asks for sympathy.—I am, &c.,

W. R.

HOW NON-SURVEYING ARCHITECTS "PROTECT" THEIR CLIENTS.

SIR.—If your contributor still thinks that architects are as likely as surveyors to supply excessive quantities, let him ask the first dozen builders he meets whose quantities they prefer. The better the quantities for the builder the worse for the client.

I write in this matter about what I know, and about what is impressed on me more and more forcibly by every day's experience. Exces-

sive quantities are an evil about which non-surveying architects do not know. They do not know whether the quantities are in excess or not; they pride themselves on having nothing to do with quantities. The consequence is, that in a multitude of cases they let their client pay 5 or 10 per cent. more for his building than he ought to pay, and in an extreme case, like that which I gave in detail in the BUILDING NEWS of August 3rd, they let him be literally robbed of £400 in a contract of less than £1,000. After this it surely does not require any great boldness, or, simply, any great recklessness, to say that non-surveying architects cannot protect their clients. The boldness and the recklessness seem rather on the side of those who say they can.

I quite agree with your contributor that architects ought to be independent, but there are two ways of making them so. One is to debar the architects from having anything to do with quantities, or knowing anything about them—with what results to the client we have seen. The other is to let him take out the quantities himself, make them the basis of the contract, and have them paid for directly by the client. If clients knew their own interests they would not be long in choosing between the two systems.—I am, &c.,

CLAMANS IN DESERTO.

SHORES.

SIR.—The author of "a chapter on Posts and Shores," in the BUILDING NEWS for Aug. 24, devotes a few lines to what he calls the "Mechanics of Shoring," in which he considers a shore as a sloping timber resting on the ground at the foot and against a wall at the top. On referring to "Tredgold's Carpentry" (35), it will be found that we have here merely the case of an ordinary lean-to roof, which has very little in common with a raking shore. The "Mechanics of Shoring" form a much more complicated problem, as the shore being wedged up tight against a "stud," or needle driven through the walling-piece and into the wall itself, has to assist in supporting the weight of the upper portion of the wall, as well as to prevent the wall itself from falling outwards. It is evident that the mere weight of the shore would do very little towards effecting these objects unless its power of resistance to compression were brought into play, and it is for this reason that the two ends of the raking shore are tightly wedged up so that its full strength as a "post" may be utilised.—I am, &c.,

E. W. T.

A SUGGESTION.

SIR.—I am frequently hearing that certain gentlemen engaged in a profession or occupation have formed themselves into a Masonic Lodge, the latest addition to the lodges thus formed being that of persons connected with gasworks. Could not such an enterprising and energetic body as the Architectural Association form a lodge admitting only members of the Institute or Association? A circular from some of the leading Masons in the two bodies would be the means of ascertaining how many brethren would be likely to join.—I am, &c.,

MASTER MASON.

Our French brethren are evidently of opinion that to have a good opinion of oneself is a professional duty. The Société Libre des Beaux-Arts has, with singular modesty, issued, as the subject of its prize essay, the following:—"Chercher depuis quelle époque l'art Français est supérieur aux arts étrangers."

A new fever and small-pox hospital was opened last Saturday, at Bowdon, Cheshire. It is fitted up throughout with Shorland's system of ventilation, consisting of the Patent Manchester Grates for warmth, vertical pipes for the supply of cold air without draught to the patients, the Patent Manchester Cowl which sheds light and extracts foul air from bath-rooms and water-closets, and patent extract vitiated air arrangement in smoke flues, for the removal of injurious gases from the wards. The building is of wood, with roof and sides covered with corrugated galvanised iron.

The foundation stone has been laid of a new Wesleyan chapel at Harrogate, the architect being Mr. Woodhouse, of Bolton-le-Moors. The estimated cost will be about £6,000, and the style of architecture Early Decorated Gothic.

Intercommunication.

QUESTIONS.

[5106].—The Largest Station.—I desire to know which is the largest in superficial area of the two following stations—viz., St. Pancras Station, London, or the new station at York?—ALPHA.

[5107].—Staffordshire Blue Metal.—Can any of your readers give me any information how the above is coloured, vitrified, and manufactured?—A. F. H.

[5108].—Strength of Materials.—I have worked as a bricklayer for some time, and am now foreman in a jobbing shop. I have attended the Science and Art Classes, and obtained first class advance in building, and intend to try for honours next year. I want to understand the strength of materials, &c. I have the published formulæ, &c., but I cannot understand them. Can any one tell me of any class or institution where I may go to in the evenings?—C. J. E.

[5109].—Illuminator.—Could any of the numerous readers of the BUILDING NEWS, interested in the art, tell me the names of any standard works on illuminating and missal painting?—PAPYRUS.

[5110].—Separating Fine Sand from Water.—Can any reader inform me how to separate fine sand from water—the sand travels with the water, and speedily renders ordinary filters inactive? The quantity of water to be dealt with is about 6,000 gallons per day, flowing from a surface spring into a reservoir.—X. Y. Z.

[5111].—Turkish Baths.—Will some one who has had experience in these kindly inform me the best and cheapest materials and construction of floors and ceilings of warm and hot rooms; also the best and cheapest mode of heating the same in the Turkish baths?—AQUATIC PLANT.

[5112].—House Ventilation.—Being about to execute a design for a rectory house, I have been asked to pay great attention to the ventilation of the several rooms. Would some kind reader assist me by illustration or otherwise the best course to adopt, and oblige—R. M. D.

[5113].—Contract Plans.—If a client applies to his architect for the "contract plans" of a building nearly finished, is it not the duty of the architect to give them to him? In case he declines giving the "contract copies" should he not furnish other copies free of charge to his client? Does not an architect by acting in this manner (refusing to show the drawings) incur censure?—A HON. PROFESSOR.

REPLIES.

[5087].—Durability of Timber.—Timber, used externally without paint or other preservatives, will be more likely to resist the effects of the weather than if planed up. The simple reason is that the loose fibres shelter the surface, protecting it from the alternating effects of rain and sunshine. As to the ravages of insects, or the effects of decay, it is immaterial whether the timber be planed up or left rough.—R. H.

[5092].—Mortar Joints.—Rolled Iron Beam.—1st. The chief consideration, other than appearance, in determining the thickness of mortar joints in brickwork, is that of strength, loss of strength being occasioned either by the joints being too thick or too thin. In the first case, using more mortar than is absolutely necessary to hold the bricks together is weak construction, as ordinary mortar is not so strong as brick; and in the second case, where the joints are too thin, there will not be sufficient mortar to hold the brickwork together. Joints should not be less than $\frac{1}{4}$ in., or more than $\frac{1}{2}$ in., in thickness. 2nd. A beam will carry double the weight when uniformly distributed than when centrally loaded, provided the load in each case is of the same nature, whether live or dead. The required weight per foot-run will be 12cwt.—R. H.

[5092].—Brickwork.—Besides the better appearance secured, the closer the joints are kept the longer the work will last, as the action of the weather will not have the amount of force against them, and therefore they will not require pointing so often. Moreover, the closer the joints are the less shrinkage will take place, and thus settlements will be prevented, as the heavy piers will shrink and form bad cracks over windows, &c.—C. T. E.

[5094].—Measuring Chimney Breasts, &c.—I cannot think where "Oue Who Does Not Know" is writing from, but I have done a deal of piecework in London, and our custom is to measure all flues as solid brickwork, as if there were no flues in them. Thus, a smoke shaft would be measured as a solid pier, and a party wall full of flues as if there were no flues. The bricklayer would not have so many bricks to lay, but he would have to target the flues instead. All openings are deducted, and the work reduced to rods and paid for at so much per rod.—C. T. E.

[5096].—Board Schools.—"Perplexed Student" will do well to procure the "Rules for Planning and Fitting-up Schools" of the Education Department, as without them it is impossible to design schools to meet the requirements of the said department. In planning schools there are many things to be taken

into consideration, amongst which are the kind of desk used, whether long or short, and whether 3, 4, or 5 rows deep; also the number of class-rooms required, and the manner of teaching in them, whether by using desks or, as in some provincial towns, only seats. The minimum area allowed is 8 superficial feet per child, but 10ft., or even 12ft., will not be too much; in fact, it is nearly impossible to have a well-planned school with less than 10ft. per child. Having settled preliminary matters, and attended to rules before-mentioned, "Perplexed Student" will find the size determined by the number of children to be accommodated. Every schoolroom and class-room, ceiled at the level of the wall-plate, must be 12ft. high inside, when with a greater area than 360 superficial feet, 13ft. high, and when more than 600 superficial feet, 14ft. When ceiled to the rafters and collar-beam, the internal height must be 11ft. to the wall-plate, and 14ft. to the collar-beam. A mixed school (boys and girls) need make no difference to calculations, but infants should always be kept separate from older children, allowing for the latter 9 or 10 superficial feet per child. A good work—perhaps the best bearing on these matters—is "School Architecture," by Mr. E. R. Robson, architect to the London School Board.—R. H.

[5096].—Board Schools.—"Perplexed Student" can get all information he requires from Robson's "School Architecture," price 15s., which he may obtain from B. T. Batsford, High Holborn.—J. HATTON LOWE.

[5098].—Concrete Parsonage.—"J. H. G." asks where any concrete parsonages can be found. The question is ambiguous, because if concrete is a good material for a dwelling-house of any description, it must be also for a parsonage, and *vice versa*. There is no county in England but what at the present time possesses some good examples of concrete buildings, and, possibly, some bad ones. They are successful erections if proper care, proper materials, and efficient supervision are obtained. The percentage saved, when compared with brick or stone, it must be self-evident depends entirely on the locality; and the comparative cost of concrete and brick erections cannot be stated unless the actual value of the relative materials, *in situ*, are known. If "J. H. G." were a constant reader of the BUILDING NEWS he should know that this journal reviewed "Concrete, and its Use in Building" (Spon and Co., 48, Charing-cross), in the number for July 27th, and in that work he will find the questions he asks amply considered.—THOMAS POTTER.

[5100].—Hollow Walls.—The outer portion should be 9-inch work, as it has to withstand the pressure of wind, force of drifting rains, &c., and, moreover, the advantage of "English bond" in the outside brickwork is obtained. If the bricks and mortar are of fairly good quality it would be better not to carry the joists beyond the inner wall, otherwise the ends may be subjected to dampness which may pass through or into the outer portion of brick wall. This applies only to ordinary houses, or to floors carrying moderate weights. A course of bricks to form a bonding course immediately above the joists helps to consolidate the inner and outer portions of walls, but is scarcely necessary if sufficient Jennings' bonding bricks for hollow walls are used; if, however, a course is employed, it should be of blue Staffordshire or other non-porous bricks, and laid in cement, or the dampness may be transmitted through the entire thickness of the walls.—THOMAS POTTER.

[5100].—Hollow Walls.—The 4½in. wall should be inside. For ordinary-sized rooms 4½in. will be quite sufficient bearing for joists. It is not always necessary for a cavity to run clear from ground to eaves, as they are sometimes stopped at floors.—J. HATTON LOWE.

[5100].—Hollow Walls.—These walls, when a brick and a half in thickness, are best built with the 4½in. wall inside. In regard to the joists, this will depend on the wall-hold "C. F. M." intends giving them. If, as in North Country practice, 9in. be required, then they must be taken through to the 9in wall, setting aside, to a certain extent, the object

of the "hollow wall." If, however, the bearing be short, 4½in. will be ample wall-hold.—R. H.

[5101].—Chimney Shafts.—If "E. F. B." would write to the secretary of the Civil and Mechanical Engineers' Society, 7, Westminster-chambers, and ask him for a copy of the paper read by Mr. E. M. Bancroft on this subject, he will get all the information he requires. It is a valuable essay, and well worth perusing, as it contains much practical information.—Jos. W.

[5102].—Fair Wear and Tear.—It seems hard on Mr. Vernon to have to make good a crack in his brickwork, but as he has covenanted to repair and keep in repair, he must do so. I do not think that a crack in a wall could be considered as resulting from "wear and tear" of the house.—W. R.

[5105].—Patent Silvered Glass.—The dampness is caused by the sweating of the newly plastered walls, the moisture combined therein being drawn to the warmer surfaces of the rooms. In all new houses an air space (half an inch at least) should be left between the surface of plastering and the backs of looking-glasses, pictures, or anything, in fact, usually placed against the walls; and for some months or a year, or more if the walls are thick. Furniture also should be kept some distance away. The object to be gained is to allow of a free circulation of air, and in suitable weather all doors and windows should be opened. A piece of flannel or cloth covering the backs of looking-glass, pictures, &c., is a good precaution against the effects of damp, and a knob of quicklime placed in wardrobes, closets, or confined places in new houses will absorb the dampness otherwise deposited on any cold surface it may come into contact with, as cutlery, plate, &c., and saves wearing apparel and other articles in a great measure from mildew and similar evidence of dampness; of course the quicklime must be renewed at times.—THOMAS POTTER.

Bricks perforated with three holes, that the mortar may get a good hold, are being used in the construction of some buildings in Minneapolis, Minn.

The arrangements are now nearly completed for the inauguration on the 6th of September of the handsome Art Gallery at Liverpool, built at the cost of Mr. A. B. Walker, Mayor of Liverpool, as a present to the town. We shall give an illustration of the building next week.

NOTICE OF REMOVAL.

CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS,
Have REMOVED from 57, St. Paul's Churchyard, to new and extensive Premises,
123, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.
Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

Trade News.

WAGES MOVEMENT.

LONDON.—The strike amongst the operative stonemasons of London has virtually concluded. From a return made on Tuesday morning it appears 120 of the leading metropolitan building firms have conceded the 10d. per hour. Out of 1,200 labourers thrown out of work by the strike, only twenty reported themselves, the remainder having found employment elsewhere. The operative masons have a good organization and efficient officers, and to do them simple justice as a body, their demands have seldom proved unreasonable.

MOTHERWELL.—About three months ago the master joiners intimated to the men that after the expiry of three months they would not bind them-

selves to abide by the bye-laws and rate of wages then in force. Subsequently they submitted a revised code of bye-laws and rate of wages for the consideration of the men. The latter have responded by formulating a counter code of bye-laws. The employers' notice expired on Saturday, the 25th, and on Monday the men came out on strike.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—(ADVT.)

Holloway's Ointment is not only fitted for healing sores, wounds, and relieving external ailments, but rubbed upon the abdomen it acts as a derivative, and thus displays its utmost salutary influence over stomaclic disorders, derangement of the liver, irregularities of the bowels, and other intestinal inconveniences which mar man's comfort.

TENDERS.

BATH.—Additions to Monkton Combe Collegiate Institution. Mr. E. H. Lingen Barker, architect:— Hill and Gay (accepted)... .. £520

COLCHESTER.—For alterations to a leather factory for Mr. Warmington. Messrs. Ebbetts and Cobb, 23, Essex-street, Strand, W.C., architects:— Everett and Son... .. £246 Dupont... .. 237

DEPTFORD.—For drainage works, Cemetery, Brookley-road, for the Deptford Burial Board. Mr. A. G. Hennell surveyor:— Kent... .. £2,649 0 0 Woodham Bros... .. 2,567 0 0 Thompson and Son... .. 2,457 0 0 McKenzie... .. 2,320 0 0 Rowley... .. 2,050 0 0 Cooke and Co... .. 1,800 0 0 Dover Bros... .. 1,685 0 0 Hare... .. 1,650 0 0 Hubbard (accepted)... .. 1,575 0 0 Simmons... .. 955 16 0

DEVON.—For new Board Schools at Teignmouth. Mr. J. W. Rowell, architect:— Underhill and Aggett... .. £5,965 Davis Bros... .. 5,920 Laphom and Goad... .. 5,867 Slocombe... .. 5,550 Furler and Co... .. 5,800 Stevens and Bastow... .. 5,749 Stacey and Rabbage... .. 5,705 Jackman (accepted)... .. 5,295 Stratford... .. 5,245

EXETER.—For four houses, &c., in Northernhay-street Mr. J. Jerman, architect (Associate and Graduate R. I. B. A.):— Gibbard, J. R... .. £1,845 Worden, D... .. 1,708 Smith, D... .. 1,465

HASTINGS.—For the erection of house in Clive-vale, for B. C. Mummery, Esq. Mr. W. L. Vernon, architect:— Reeve... .. £1,016 10 0 Harman... .. 1,012 10 0 Ditch... .. 994 0 0 McConnell (accepted)... .. 902 10 0

LONDON.—For the alterations to offices, No. 1, Muscovy-court, E.C. Mr. J. Randall Vining, architect:— Smith and Co... .. £636 Stamp and Bowtle... .. 587 J. Garrad... .. 583 P. J. McManus... .. 523 Thos. Boyce (accepted)... .. 474

LONDON.—For warehouse, Watling-street, E.C. Messrs Ford and Hesketh, architects:— Adamson and Sons... .. £6,527 Browne and Robinson... .. 6,380 Dove Bros... .. 6,365 Peto Bros... .. 6,290 Scrivener and White... .. 6,287 Brass... .. 6,118 Lawrence... .. 5,957 McLachlan... .. 5,871 Shaw... .. 5,763 Perry and Co... .. 5,723 Corder... .. 5,599 Newman and Mann (accepted)... .. 5,599

THE BUILDING NEWS.

LONDON, FRIDAY, SEPT. 7, 1877.

DESIGNS FOR THE NORTH LONDON HOSPITAL FOR CONSUMPTION, HAMPSTEAD.

WE have examined the designs that have been sent in competition for this building, and though they are only eight in number, we think the committee have been fortunate in securing a set of designs marked by some ability. We can duly appreciate the endeavour to render that prominent hill-top, known as Mount Vernon, worthy of the picturesque charms of Hampstead, and the architects who have contributed have tried their best to make their work harmonise with the features and surroundings of the place. The instructions verbally given to the several competitors were that 100 beds were to be provided in the proposed hospital; that the out-patients' rooms, the dispensary, the physicians' rooms, stores, &c., were to be provided in the basement; that the board-room, secretary's office, matron's apartments, the resident physician's rooms, &c., should be on the ground floor; that the first and second floor should be devoted to the accommodation of 50 patients each, or 25 of each sex, while the top floor should contain the kitchen and other offices. A further condition was that the wards should be for 6 or 8 patients each, with a few for a less number. Future extension had also to be considered, and the site, which is triangular in shape, necessitated the main frontage to be towards the road leading from Hampstead to Branch-hill, on the west side of the present hospital. As a rule the balcony principle has been adapted with varying degrees of success.

The design, "Experientia Docet," which we first come to, exhibits a block in a free kind of Classic Vernacular in red brick, relieved by stone and terra cotta. The treatment is sensible, but not marked by refinement, and we perceive the author has adopted a meaningless feature or two from the recent Wakefield prize design. Looking at the plans, which in this case form the only recommendation, and upon which the selection will mainly hinge, we find the author has a long block terminated by cross wings. In the basement are the dispensary, boiler, stores, &c.; on the ground floor the nurses' rooms, waiting rooms, and temporary chapel. The plans of the first and second floors contain the wards. These are arranged with a corridor along the north side upon which they open. The wards are for 7 or 8 beds, and have end windows. The author places his bed and living rooms on the south or south-western side, the corridors being on the other side. Fifty beds have been provided for women on the first floor, and fifty for men on the second floor—we should have preferred each floor to have been divided for both sexes. In the centre is a semicircular bay projection, which forms the day and dining-rooms—a feature of some merit. The kitchen and other offices are placed at the top, the former occupying the centre high-roofed portion with lifts. We find the author estimates his design at £13,500. "Hampstead" is the motto of a design that at once attracts us by the home-like style of its architecture and the picturesque handling of the features. Like the last, the author has a long block facing the road with end cross wings, but the corridor of communication is placed in front, and forms an arcaded balcony of timber externally resting upon a stone arcade of Gothic design—a very desirable and pleasing feature in the design. This open arcade stops

against the extreme wings, and the two central day-room octagons, which form a rather piquant addition to the main elevation. Though there is some thought and artistic skill displayed in the plans, the author has not been so successful in his wards. These are 25ft. by 24ft. each, and have two end windows and fireplace towards the south-west, with a verandah on that side, scarcely well lighted enough, especially those shadowed by the return wards in the wings. The day rooms, as we have mentioned, are placed in front and project from the arcaded balcony, the main stairs are central, and the smaller staircases are in front in the extreme wings, with the w.c.'s, lavatories, &c., at their outer angles. Occasional wards are provided at the ends of main corridor in the wings, and the general administration seems planned with care. The chief recommendation of the design is, however, the exterior treatment, which is in a half-timbered domestic type of Gothic, though there is apparently a want of connection between the centre and wings. The author's estimate is £16,500, the rate being £150 per head, including warming, &c. The author of "Light is Life" has certainly approached the pathological idea of hospital arrangement in his plan nearer than any other competitor. He has taken advantage of the pavilion principle in arranging the wards lengthwise along an axis. We have here a central block containing the hall and stairs, with an elongated pavilion on each side. The ground floor shows the board-room in centre behind, the secretary and resident medical officer's rooms on the right, and matron's rooms on the left. A long corridor extends the whole length of this floor, and connects the projecting wings, comprising the male and female patients' day rooms, 53ft. x 22ft., which form the extreme ends of the range, and small wards for four and five beds. The ward plan shows a series of wards placed lengthwise on each side of central stairs, with two end staircases in the wings. Each room holds seven to nine beds, and has windows on both sides, the fireplace being placed between two windows on the south side. This arrangement is one that has been followed with obvious advantages in hospital-building. The day-rooms are at the ends, and balconies have been provided round them, well suited for convalescent use. Each floor accommodates 25 of each sex. The wards are 22ft. wide and 13ft. high, the author giving 6ft. of wall space or 850 cubic feet to each patient. Advantage has also been taken of the fall of the ground. The style adopted is shown in a well-drawn ink perspective that, however, strikes us as representing a loftier block of building than the length of frontage warrants. The front is divided into vertical slices gabled above, and the effect is, to our minds, wanting in connection and solidity of character. The features and dormers betray a decided Jacobean feeling, and are less characteristic than "Hampstead" for a rural site. We next come to "Home Comfort"—a design happily treated elevationally, being in a French chateau style, but showing inadequate lighting, with an arrangement that must be pronounced defective. The ground plan is cut up, and the alternate recession of the wards with balconies between, and the centre corridor are points that rather place this plan outside the field, from a pathologist's point of view. We at the same time admit the author has endeavoured to give homeliness to his wards by reducing their size, and the external treatment of the alternate balconies is clever and piquant. Another design, "Extend," adopts a very similar arrangement to the last, the block being traversed by a centre corridor, the wards being long and short, with open balconies between. There is a centre stairs,

and the ambulatory or corridor is made a feature. The wards, 24 x 26 for eight beds, are lighted at one end entirely, the clinical cases and nurses' being put between the wards. The lavatories and w.c.'s are well placed at the outer angles. Externally the front, shown by a nicely-drawn ink perspective, has a dignified and characteristic look in a Classic treatment, displaying some refinement. The centre is perhaps rather crushed by the pilasters, but the side arcades and the roof are pleasing features.

"Cavendo Tutus" has adopted the balcony principle, the wards being on the inner side for four beds each, with central stairs and lifts, and a special ward in the front. Two end wings give wards for eight beds each, and the bath-rooms, &c., are placed in semi-isolated pavilions at each end of the building. The author endeavours to obtain all the advantage of wards lighted on both sides; the gallery to this end is partly lighted by projecting bays, and the wall of wards adjoining this gallery is pierced with windows. There is certainly an effort to do the right thing, but the result is not successful, and the Gothic front lacks repose and breadth from the cutting up of the front. "Heath" is a flashily-coloured red building of the asylum type, and in a Queen Anne dress; but the author has fallen into the error of giving us an old-fashioned plan, with long advancing wings, L-shape, the consequence of which is the wards are imperfectly lighted. The author of another, "A Trap to Catch a Sunbeam," has a clever idea, but it has been imperfectly worked out. There are two radial pavilions or blocks attached to a long frontage, X-shape, the wards being chiefly in the former with a side corridor. The design shows a pleasing grouping of parts, but the administration seems rather confused. We cannot fail to notice that the authors of these designs have been struggling to combine the wants of a hospital with some architectural character. Unfortunately the dictates of sanitary science have rather run counter to the notions and traditionally-accepted models of architecture, and those who have most boldly accepted the principles laid down by authorities in hospital construction have failed to realise architecturally the kind of building suited to Hampstead. The majority have, we think, rather fallen short from a want of study of the necessities of ward arrangement in the essential point of light and air, or in the administrative part. The committee, nevertheless, should bear in mind that their requirements really point to a home for consumptive patients rather than a hospital; it should be looked upon as more of a convalescent sanitarium, the rooms should be small, home-like, and limited to five or six patients, and the administrative arrangements should be such as to reduce to a minimum the work of the nurses and attendants. We believe, as a rule, the great-hospital plan to be a failure, and the death-rate of recent institutions of the kind shows the desirability of making a hospital as much like a home as possible. Mr. Street, we understand, is to be the referee.

LIGHT, AND ITS RELATION TO ARCHITECTURE.

THERE is a great deal to be said about the modern sash-window. Its relation to health and ventilation, its aid to cheerfulness and comfort, and its artistic capabilities make it one of the most useful and valued of the many functions of a building. A windowless building is a heavy gloomy structure at the best, though our ancestors in the feudal times gave all the play of light and shadow they could to their keeps and moated structures. They were heavily

fringed with embrasures, and pierced with crenellations. Nowadays, the pressure of a town population has compelled the architect to make the window the conspicuous organ of his building. As it is the only source of light and air to a building, so it has come to be enlarged, like those functions of animal life the ontologist or evolutionist has traced to some variation or change of condition of the animal. Of course climate has mainly influenced the development of this feature—in fact, if we trace it from the earliest ages of building in the East, through the various civilised nations, we find a varying size given to the aperture, according to the latitude and power of the solar rays. But this had not been the only influence. The requirements of defence necessitated, as we have seen, a very small aperture on the exposed sides as observed in many of our Border castles. Another cause that operated against the adoption of a large window was the want of the necessary materials. As civilisation advanced, these restrictions have become relaxed, and the demands of city life have led to the enlargement of the window. A curious reversal of this law of development we are just now apparently witnessing in the revival of the Vernacular window of the 17th century, when the window tax and the small panes of glass imposed restrictions to lighting. It is evident, however, on considering the change from Gothic to Queen Anne, that such is really not the case, but that we are returning to a style in which the large square sash-window was the redeeming feature. As to the smallness of the panes, there is an artistic reason for this, apart from the question of light. Viewed architecturally, indeed, there is much to be said for a style in which the window is made a sensible and conspicuous feature, and this is one of the reasons that has made us tolerant of that revival. But light has so many other claims on our regard hygienically, that we may briefly refer to a few of them. In a recent paper, read by Mr. Carl Pfeiffer, in the United States, the subject has been dealt with, especially the limits of the utility of glass. The lecturer referred to the thickness and qualities of glass, and its various properties of transmission of light. It is either too thin or too thick, badly made, or wrongly placed. The thick French plate glass was instanced by Mr. Carl Pfeiffer as especially injurious. The sunlight that passes through it is rendered oppressively hot; in fact, there is something in the material of which the glass is composed, or the manner in which it is manufactured, that renders it extremely unpleasant as a transmitter of light. When the rays of light fall obliquely on this thick plate glass, the oppressive feeling is intensified. Mr. Carl Pfeiffer says:—"It would seem evident that the heat rays and the magnetic rays which light produces in its transit through our atmosphere gain the preponderance over the pure light rays by passing through the glass, and, destroying the equilibrium, injure our health." A window of small panes of uneven quality, the author observes, produces a similar effect: the rays of light are refracted and cross each other. Reflected light of all kinds is, according to the paper we are referring to, open to this objection, and the suggestion is thrown out that the colour of the walls of a room should be regulated by the number and position of the windows, and that no mirror should be placed for the light to fall upon it. Sir David Brewster suggested to a friend who was engaged at his desk in a dark office in the City to extend a fine white muslin blind on the outside of his window, flush with the wall; the advice was taken, and the light was caught by the fine fibres, and thrown into the room greatly to the relief of the eye.

sight; but in this case the light is not reflected, but direct. Another instance is adduced from Miss Nightingale's "Notes on Nursing." She shows the purifying effects of direct sunlight upon the air of a room, and mentions the fact that all patients in a sick ward lie with their faces towards the light, even though it sometimes gives them pain. We know the musty and close smell of rooms that have been long darkened; and every physiologist knows that the sunny side of a street is generally the healthiest, while the inhabitants of the shady side of deep valleys are invariably weak and degenerate. It has been observed also that in dark wards or those lighted from the north only, the sick do not speedily recover. The author affirms that the mischief resides in the reflected light. The "all-overpowering delight of the patient, and, indeed, every health-desiring human being, however, and the sweetest treat for the eye itself is to be able to look through the direct light of the atmosphere into the blueness of the sky, that most wonderful mixture of darkness and light—that dark background of the infinite, lit up with the clearness of light to the very shade suited to human eyes." The being able to see out of a window is another great health condition, and architects, if they bore this in mind, would probably give us less of borrowed lights and fewer windows facing dead walls than they occasionally do. The axis of a ward should be, if possible, placed north and south with windows on both sides, so that the sun may not be absent during the day. Miss Nightingale says the window space should be one-third of the wall space, and placed from 2ft. to 3ft. of the floor to 1ft. of the ceiling.

But confining our attention to the qualities of glass, as M. Emile Saigney remarks:—"All forms of light exhibit three kinds of rays—those which are purely luminous, those which are also calorific or heating, and those which are chemical or magnetic." The first or luminous rays we cannot see, as we can only see colour, but of the other rays transmitted, or the coloured light, the yellow, orange, and red rays are specially heating, while the blue, indigo, and violet are magnetic; but it is not generally known that the maximum of heat is found in the dark region beyond the red, and that those refracted beyond the violet on the other side excite chemical action. Thus, it is shown that different qualities of glass change the relation between the luminous, calorific, and chemical rays, and that, in short, all glass acts more or less in the manner of a prism. While providing for an abundance of pure light, the means for regulating its supply becomes necessary, and blinds or shutters of some kind are required. The colour of these blinds may be made conducive to the comfort or health of the inmates. Thus, green, blue, and neutral-tinted blinds or curtains may be beneficial for those suffering from nervousness or irritation; while red and scarlet may be desirable for those who require stimulation, and are in depressed spirits. There can be no doubt that the value of colour in hygiene is neglected, and is not studied sufficiently by the architect in wall papers and interior decorations. In our hospitals, school-houses, and public institutions and offices, the importance of the windows, their size and position, become one of the most vital of all the questions demanding attention. We may here remark upon the prevalent practice of placing the windows to suit the elevation of a building instead of the room. Architects frequently make the blunder of placing bedroom and sitting-room windows so low as to give outlook only, without thinking of upper and direct lighting, or they place them low, so as to allow an outer cornice, verandah, or balcony to pass over

the window head. The result is indirect lighting, bad ventilation, and a depressing effect on all the inmates. Dark rooms and corners are always unhealthy and unwholesome, from the absence of the chemical action of the light; and the extreme value of well-lighted nurseries and playgrounds is beginning to dawn upon those who thought children could be confined to any corner. Mr. Pfeiffer, indeed, suggests the benefit that would accrue by giving children the "solar air-baths"—the ancient *solaria*—in which they could lie naked upon the floor, their bodies being bathed in bright sunlight and pure air; though we think such a luxury would be unnecessary if the dormitories and nurseries of our houses were well supplied by window light. Dr. Winslow refers to the advantage and comfort to invalids of providing a garden on the top of hospitals, planted with shrubs, and laid down with grass, and interspersed with bright and sweet-smelling flowers. In this retreat the convalescent inhales pure air, and what is as necessary, pure bright sunlight. The life-giving and health-sustaining influence of sun and air is nowhere more felt than in this populous city of London. We have frequently spoken of the advantage of utilising our house-tops, if only for flowers and as children's nurseries. Carl Pfeiffer says if the value of light to the skin of children were known we should have plenty of glass-house nurseries. To those of scrofulous habit, the benefit of sunlight and oxygen is immense; and if our underground dwellings, and crypt-like basements could be lifted up out of their eternal shadow to gain sun and air, many a weakly child that now perishes, might be saved. The cellar dwellings of London and large cities are a disgrace to our civilisation, and it is satisfactory to know the Local Government Board are turning their attention to them. Permeated by drain and other noisome gases, ill-ventilated, and robbed of nature's light—what can be expected but an alarming mortality among our cellar population? The model bye-laws issued by the Board provide an open space—extending at least 24ft. between the line of frontage of domestic buildings and the opposite premises, and this space is never to be diminished, and in the rear the space is to be not less than 150ft. sup. per house. Other provisions to regulate spaces between are made, to which we may refer another time. The area of windows to every habitable room is to be equal at least to one-tenth of the floor area, and to be constructed so that one-half at least may be opened. Dr. Winslow, in his work on the "Influence of Light on Health," refers to this subject. The Towns Improvement Clauses Act of Scotland enacted "that no cellar less than seven feet high, without a window, and of which more than two-thirds are below the level of street, should be inhabited." In Germany the occupation of cellars is prohibited; but, according to Mr. Pfeiffer, no city is so cursed with sunless dens as New York. Its tenement houses are densely packed, and even exceed in some parts those of London, there being 200,000 persons to the square mile, or 120,000 more than are packed in the latter city, the mortality among which is chiefly confined to children. The evil can only be remedied by legislative action; dwelling-houses in towns should not be lighted by shafts or deep well-holes five or six stories high—such a mode of construction should be discontinued; every bedroom should have sunlight when practicable, and borrowed lights should be prohibited for dwellings. It would be very easy to frame rules to meet the most urgent cases. Again, houses should be restricted to a certain number of stories, and as Mr. Carl Pfeiffer says, reform is needed here as in New York, where in Nassau-street,

Fulton-street, and Broadway, houses of from seven to a dozen stories are run up. This subject is undoubtedly one for the architect; he should be enabled to regulate the quantity and quality of his light; he can tone it with the hues of painted glass, and regulate the health and comfort of the inmates by means which art and science have placed within his grasp. One authority has proposed, indeed, to make use of glass as a remedial agent, and to effect by glass the banishment of all disease, to cover in acres of ground by prodigious palaces of glass filled with park-like accessories, where the vicissitudes of winter would be avoided and where thousands of people may enjoy a perpetual spring, undisturbed by changes of weather. Such an idea is too Utopian: nevertheless, there is no reason why every house should not be a sanitarium.

ART AND ARCHITECTURE.

AT a recent meeting of the Newcastle Improved Dwellings Company, the Chairman (James Hall, Esq.), remarked that any one who travelled much abroad, particularly in France or Italy, on returning to this country, must be struck by the meagre artistic taste which as a rule was displayed in our street architecture. It was a mistake to imagine that artistic effect could not be produced without incurring extra expense. A beautiful house, designed by a true artist, need not cost any more than an ugly one; beauty did not consist in a profusion of useless ornamentation, which was sometimes used to cover serious defects: but could be produced by the use of simple lines and curves, which were equally as effective as the most elaborate carvings, when guided by a master-hand. When on the Continent he had frequently noticed how artistically the most trivial details of domestic architecture were treated, which seemed to give a charm and attraction to houses which were not generally experienced here. There was an affinity between the outside appearance of houses and the social habits of the inmates which was not thoroughly understood. They should remember that home was the place where our dispositions to good and evil, which characterised after life, were first formed and nurtured; therefore, one of the best ways to improve a working man, socially and otherwise, was to render his home attractive both inside and out, that it might become a positive pleasure for him to return there after his daily labour, which, he regretted to say, was not always the case. He saw no reason why workmen's dwellings should not be rendered as attractive as the residences of the rich, by more artistic treatment of the materials at command, and their proper adaptation to the requirements of that class of tenants. He would be glad to see further improvements made in this direction, and felt assured that the results would prove satisfactory from all points of view.

A new Board School is about to be erected at Teignmouth from the designs of Mr. J. W. Rowell, of Newton Abbott. Mr. J. Jackman, of Teignmouth, is the builder, and the cost will be £25,295.

The arrangements for the opening of the Manchester new Town Hall were agreed upon last week. On Thursday next the members of the Council will assemble at the old Town Hall, and walk to the new building, where a gold key will be presented to the Mayor (Mr. Ald. Heywood), who will open the principal door. A special meeting of the Council will then be held, and an address will be adopted and presented to the Mayor. In the evening a banquet will take place.

The foundation stone of a new Roman Catholic chapel, at Whitechurch, was laid last week. The edifice will cost about £2,000. The architect is Mr. James O'Byrne, Liverpool, and the builder Mr. John Matthews, of Nantwich. The dimensions of the building are 86ft. by 24ft. It will be built in the Gothic style of red brick, with Grinshill stone dressings. The chapel will seat about 400 persons.

Christchurch, Weston-super-Mare, has been restored and enlarged under the superintendence of Mr. Hans Price, of that town. Mr. Rossiter was the builder. The cost has been £1,100. A new chancel has been added, together with an organ chamber.

THE CONGRESS OF THE BRITISH ARCHÆOLOGICAL ASSOCIATION AT LLANGOLLEN.

[FROM OUR OWN REPORTER.]

WE resume our report, supplying a fuller account of the proceedings on Wednesday week, of which we could only give a line or two in our last.

WEDNESDAY

Was devoted to a carriage excursion to places of interest within a few miles of headquarters. A numerous party left Llangollen at 10 a.m., and proceeded towards Chirk by the old Holy-head-road. Nearly opposite Cefn

OFFA'S DYKE

Was crossed, and the members alighted to follow and examine it. It consists of a deep and broad ditch, and a mound still in many places as much as 8ft. or 10ft. in height, the ditch being on the Welsh or western side. This dyke is much more perfect and distinct in this section than that known as Wat's, which runs through the grounds of Wynnstay on the opposite side of the valley. It was remarked that where a natural boundary or obstruction, such as a river or steep hill, occurs, the earthwork ceases; thus near Cefn the dyke terminates at a steep cliff overlooking the Dee, and reappears on the opposite shore. Several speakers mentioned that it was always called in ancient chronicles by its present name, although one or two, with Mr. Burgess, were disposed to attribute to it a military rather than a civil origin, and to antedate it to the days of the Romans. If poet's dicta might be allowed weight in deciding knotty points of origin, we might quote Churchyard's description:—

There is a famous thing
Calld Offa's Dyke, that reacheth farre in lengthe.
All kinde of ware the Danes might thither bring;
It was free ground, and callid the Briton's strengthe.
Wat's Dyke, likewise, about the same was set;
Between which, too, bothe Danes and Britons met.

CHIRK CASTLE.

Passing through a pair of fine wrought-iron gates, dated 1779, concerning which the villagers have the odd notion that they were beaten out by a man and his wife, the members drove through the park to Chirk Castle, the residence of Colonel R. Myddleton Bidulph, M.P., and one of the most ancient inhabited houses in the kingdom. It is a quadrangular structure of three stories, strengthened at the angles with round towers. It occupies the site of the ancient fortress of Castell Crogen, but the only portion of the present castle that dates from Edward the First's days is at the north-west angle, the entrance to the quadrangle. This is surmounted by a tower known as Adam's, of very slight breadth compared to its depth; on the inner face of this tower is a projecting oriel window, and beneath it the dungeons. The greater part of the fabric dates from about 1595; on the east side is an inscription stating that it, and the tower above, was all rebuilt by Sir Thomas Myddleton in one year, 1636. The roofs are now concealed by parapets, but when the high gables, of which traces exist, were perfect, the views in the quadrangle must have been extremely picturesque. A visit was first paid to the armoury in the basement, which Mr. Bloxam characterised as containing a remarkably perfect collection of arms of the period of the Civil Wars, including long-barrelled short-stocked guns (originally fired from a rest), pikes, and swords, and also a veritable black jack, a broad-brimmed Puritan's hat, and other relics of the sharp fighting. The castle, it was remarked, was once besieged by its own possessor, Sir Thomas Myddleton, at that time a Parliamentary, who endeavoured to dislodge a party of Royalists ensconced there. Sir Thomas ultimately changed sides, and in his turn was besieged, and forced to surrender, and the castle was greatly injured. Crossing the courtyard the members made the tour of the grand suite of apartments, under the guidance of Mr. J. Tom Burgess, who drew attention to the portraits and tapestry, and also to the unrivalled collection of cabinets of 17th century date. Of the latter the gem was one given to Sir Thomas Myddleton by Charles II. at the Restoration; it is of ebony, richly inlaid with

silver, with three internal panels, said to have been painted by Rubens. Some discussion occurred in the domestic chapel as to the period of its building, many members doubting if it be of earlier date than Charles's reign, although it is claimed to have been added in the 14th century.

PONTCYSSYLLTAU.

After luncheon at an hotel in Chirk village, the return journey was commenced by way of Pontcyssylltau, to allow of a closer view of the viaduct and aqueduct by which the valley of the Dee is spanned. The latter is one of Telford's masterpieces, and was constructed in 1795-1805 to carry the Ellesmere canal across the mouth of the Vale of Llangollen; an embankment stretches for 1,500ft. from the south side, and is connected with the other side by 18 light piers of sandstone and two abutments; these piers support an iron trough 1,007ft. long, carrying the water-way and towing-path at a level of 120ft. above the Dee. The viaduct, which was designed by Mr. Robertson, C.E., carries the Great Western extension railway to Barmouth, and also has 19 arches of 60ft. span, the rails being no less than 150ft. above the river. Passing through Llangollen the party proceeded to

VALLE CRUCIS ABBEY.

The conventual buildings are now occupied by a farm premises, but remains in a very perfect state. The Abbey Church is a roofless ruin of great beauty, and occupies the same position—as the finest remains of a conventual establishment—with regard to North Wales, that Tintern does to the southern part of the Principality, although, indeed, that abbey is just without the modern limits of Cambria; the positions of both abbeys by the side of a stream are very similar. The west gable, with its triplet of two-light lancets, and a rose window above, is very elegant in effect. Within the chancel Mr. Loftus Brock read the paper which we printed last week.

Mr. C. W. W. WYNNE, of Peniarth, described the results of the excavations of the abbey premises carried out by himself and the late Lord Dungannon many years ago, when the tombstones now arranged in the grassy space of the church were discovered buried in the earth, as well as a leaden bird (probably the arms of the abbey, used as the balance of the ever-burning lamp in the sanctuary), the ruins of the great tower, &c. Some discussion arose as to the date of the west gable; and Mr. Bloxam afterwards described the gravestones in the church. At the suggestion of Mr. Brock the thanks of the members were accorded to Mr. Wynne for having cleared out the ruins, and rendered so plain the plan of this beautiful structure, the proposer remarking that it was to be wished that all owners of ancient abbeys knew that by putting them in good condition tourists would be attracted in such numbers as to repay the expense and the wages of a custodian.

ELISEG'S PILLAR.

A singular inscribed column, about a quarter of a mile beyond the abbey, was the last object visited. It stands on a tumulus on a pedestal of squared stone. It is but a fragment of a circular shaft about 7ft. in height, with a roll ornament upon the upper part. Upon its surface is an almost illegible inscription in Celtic letters. From the base Mr. Bloxam read a paper, in which he described the pillar as giving the earliest lapidary inscribed pedigree in the country, and its being the most remarkable post-Roman memorial. When perfect, it stated, according to copies made at the time, that it was erected by Concern to his great-grandfather Eliseg, who recovered his inheritance of Poosia, after the death of Cattfell, by force, out of the power of the Eng, by his sword. The upper part of the column is now lost, but the lower part existing yet was set on its ancient base about a century since. Mr. Bloxam said he should ascribe the date of the monument (which gives also the intervening generations between Eliseg and Concern) as about the 8th century. It has the peculiar entasis of Classic monuments—a fact he had never before heard noted.

In the evening a meeting was held at the Assembly Rooms, when papers bearing on Welsh philological questions were read by the

Rev. Dr. Margiliouth, M.A., and Mr. John Rhys, professor of Celtic at Oxford.

THURSDAY.

A carriage excursion to places in the neighbourhood of Corwen was the chief feature of the day.

SYCHANT,

One of the sites claimed for Owen Glendower's house, was the first stopping place. A mound, said to have formed one of the earthworks defending the site, having been examined, the party proceeded to a place surrounded by a dry fosse, which Mr. G. R. Wright, in a paper read on the spot, claimed to be the "Sychant" (dry place), described by the bard Iolo Goch as that whereon stood Glendower's residence, which he said was equal in magnificence to Westminster Abbey, had a gate-house and walls surrounded by a moat, and that near it was a wooden house, supported on posts and covered with tiles, used for the lodgment of guests, and also a cross-shaped church. The bard added that there was a good heronry and falconry, and also excellent fish to be had from the river. Mr. Wright contended that the earthwork just visited was an outpost of defence, and another and higher one, to which the party went just subsequently, was the principal one; but several speakers appeared unconvinced that this was the true site of the house from which Owen is said to have looked upon 40 square miles of his own land. At a neighbouring farm-house Glendower's table was inspected. It is certainly a very ancient and clumsy piece of furniture, once a board, about 16ft. long, 3ft. across, and more than $\frac{1}{2}$ ft. thick; but now, for convenience, it has been sawn across. Several members thought it quite possible it dated from the time of the chief, whose full name, Anglicised by Shakespeare into Owen Glendower, was Owain ap Gruffyddo Glyndyfrdwy. He was, it may be remembered, the great grandson of Llewellyn, the last of the British princes.

CORWEN.

The attraction in this quiet Merionethshire town, at the foot of the Berwyn Mountains, was the church. On entering the graveyard a stone pillar of great antiquity, and locally known by the brief and euphonious title, Carreg y Big yn y Vach Rwyd, or Glendower's sword, was glanced at. It is a monolith, 7ft. in height, and tapering from a girth of 51in. at the base to 31in. at the neck. The head has been injured, but yet shows on each face a panel, 11in. square, filled with interlaced ornament of late Norman character. The angles of the shaft are chamfered away, and finished with a roll moulding, and the whole is embedded in a massive circular slab of slate. It derives its name from the fact that on the (east) side facing the church is sculptured in bold relief a dagger-shaped Latin cross, about 1ft. in length. The proportions of the pillar are very elegant, and assist in fixing its date at about the last third of the twelfth century. Near the entrance-gate is the pedestal of another cross, into which has been set, a dozen years since, a post ornamented with Jacobean carving, and carrying a sun-dial. The church was formerly cruciform, with a square tower at the west end, but as more seat room was needed, it was enlarged as well as restored in 1871 by Mr. Benjamin Ferrey, F.S.A., who substituted for the south transept an aisle of the same width, separated from the church by an arcade and large circular piers. At the same time (as we were informed in a paper read in the church by the Rev. W. Richardson, M.A.), the utterly uneccelesiastical round-headed windows of Hanoverian date were taken out of the walls and traceried ones put in their stead. At the east end yet remains a triplet of three lancets, deeply splayed, and probably contemporaneous with the great circular font—both First Transitional in character. Nothing is known as to the period of erection or earlier history of the church, and no other features appear earlier than the 14th century. The church is dedicated to the Armorican missionaries, Moel and Salien, who lived in the 6th century. The long narrow nave and chancel of same width pointed, Mr Richardson suggested, to an early origin. Great length in proportion to width is a

characteristic of a class of Welsh churches, and was probably adopted for strength and to keep out the driving rain. The chancel, we noted, has a modern boarded roof internally; that over the nave is a substantial oak hammer-beam roof, marked by the peculiarity that the king-posts stop short of the apex, and that in the remaining transept is yet richer in character, and also of late 15th century workmanship. Some oak panelling of a good but not uncommon type, prevalent 80 years earlier—consisting of a rose surrounded by a pierced quatrefoil—was found during the restorations in the chancel ceiling, and has been preserved and used to beautify the communion rails. In the vestry is an oak chest carved out of the solid bole of some giant of the forest. It has been roughly squared out for the reception of plate and vestments, and measures externally 56in. in length, 25in. across, and 29in. in depth. The weak point is the ironwork securing the lid, which, like Rob Roy's house, held-to at the back with a bit of string, could be forced with comparative ease. When leaving we examined the exterior of the low south chancel door, on which is a singular incised carving of a dagger, about 22 $\frac{1}{2}$ in. in length, with a cross-guard 10in. through. It is said to have been caused by Glyndwr, who, when in a rage, threw his dagger at the church-door from the cliff side above. It is needless to comment on the vigour with which the Welsh traditionally endow their famous chieftain, further than to note that a careful measurement showed the indentation to be fully an inch deep. After a luncheon in the schoolroom the journey was resumed to

RHUG CHAPEL,

Or Rûg Chapel, a small Carolian building in the grounds of Rûg Hall, and highly interesting as showing a scarcely altered Stuart domestic chapel of the Stuart period. Externally it has been re-roofed and beautified of recent years, but within it has only been cleansed and repaired. The springers of the hammer-beams, by which the roof is divided into four bays, are concealed by figures of angels; the beams themselves are painted with flowers and fruit, and the pilastered surface between the purlins is covered with wavy lines. The colouring is throughout of low tertiary tones. On the eastern beam we note the date 1637, probably that at which these decorations were completed. On the north wall is frescoed in black and white a skeleton and other emblems of mortality, with singular inscriptions (in Welsh), warning the reader that he, too, will soon be as silent and forgotten. The communion furniture and stalls and benches are of the solid workmanship of the period, the ends of the latter being connected with those before and behind by low concave steps, mortised and pinioned into each upright. On the ends are carved the thistle, rose, and other national emblems. At the west end is a large and low gallery, having the bolt and egg ornament carved on the front. The ritual chancel is indicated by a light open screen, decorated above the rail with a freely-carved fringe ornament, and in the centre of the church hangs a rough and clumsy wooden candelabra, reminding one, in the arrangement of the loose bars and spindles, of the little swinging cradles one may now and then see suspended by a stout hook and rope from a beam of the living room in old-fashioned cottage homes in mid-Wales. In the graveyard is a 14th century shaft of a cross of slender proportions surmounted by a modern head. The Rev. W. Richardson read a paper in the chapel. The adjacent mansion of Rûg, once the residence of the Vaughans, now that of the Hon. C. W. Wynne, is being enlarged under the direction of Mr. Kennedy, of Bangor.

CAER DREWYN.

This ancient encampment, situated on a lofty hill, isolated on three sides, opposite Corwen, was the last place visited. It was described by Mr. G. R. Wright, who drew attention to the fact that upon it Owen Glendower assembled his troops (c. 1405) before descending to meet those of Henry IV. on the marsh land by the side of the Dee below. A large encircling wall of loose stones, the one side of which passes up to a little cairn on the highest point, renders the hill very conspicuous from a distance; these are also parts of two other aggers and a line of fosse surrounding the hill, render-

ing it easy to reconstruct the lines of the early British camp, which probably existed here centuries before Glendower's occupation. Pennant speaks of the marks of tents being visible all over the hill into the valley in his time—a century since—and clearings of the ferns and furze showed that pits and hollows, presumably made by man, cut up the surface of the hill; but the members were more intent on tracing and identifying the best known peaks and rounded clumps in the ranges of mountains rising tier on tier on every side, than on the marks of the encampment around and below their standpoint. On the return journey a stay was made at the Rev. W. Richardson's, Corwen, to see a silver chalice dug up in a cellar in the town some years since, in a blackened and battered condition—and presumed to be of great antiquity, perhaps that used by "Iorwerth Sulien, vicarius de Corvaen," whose inscribed effigy is placed on the north side of Corwen chancel. A member dispelled the pleasant dream by showing that it was marked with the stamp of a well-known Nuremberg maker, and could not, therefore, be older than 1780.

At the evening meeting, presided over by Bishop Merriman (Grahamstown), Mr. GEORGE G. ADAMS read a paper on "Medals Commemorative of Events in British History." Although medals and coins have received less attention than almost any other branch of art, he thought England is improving in this respect, although she is surpassed as to the designing of medal dies by Germany, France, and Belgium.

Dr. PHENE followed with a paper on the hill fortress of Tre'r Caeri, near Pwllheli, North Wales, tracing the similarities between it and structures in Brittany, and in the East. The lecture was illustrated by numerous plates and diagrams, and Dr. Phéné endeavoured to prove that the antique religion of the dwellers in these hill camps was the worship of the sun serpent, and that this was introduced into Europe by Phœnician traders.

FRIDAY.

The day's outing was by rail to Dolgelly, visiting several places on the return journey. From Dolgelly station the members proceeded at once over the hill to

CYMMER ABBEY.

The ruins of this Cistercian house comprise the ivied walls of the church, and several of the domestic buildings, now occupied as farm premises, the whole being inclosed within a wall of loose stones. Mr. Loftus Brock stationed himself beneath a large sycamore tree inside the nave, and read a paper, of which the following is a full abstract:—

Directing attention to the beauty of the surrounding scenery in and about the long valley, the triple peaks of Cader Idris looming large to north-west, the lecturer remarked that from the site itself they could gather that these remains were those of a Cistercian abbey. Indeed, every spot around had its tale of old days to tell. The wooded ground across the valley, reached by a hedge of some antiquity, had a quaint little church dedicated to St. Iltyd, a name reminding us of the remote period when the Gospel was first proclaimed in these valleys. A glimpse of its simple bell-turret might just be seen over the trees. On the rough hills to the left of where they stood, were traces of earthworks, and beside some white cottages was a mound, one of the mysterious dwelling-places of an almost unknown people. Still further to the left was the site of an ancient chieftain's house, where a meeting was arranged between Owen Glyndwr and his kinsman, with whom he was at variance. They met on the hillside and Owen killed his adversary, and hid the body in an oak which was long pointed out. The very ruins of the house have disappeared, but Miss Lloyd has lent to the temporary museum some large bronze vessels recently found on the site. Mr. Brock pointed out that just above the abbey site might have been chosen one equally sheltered, less damp, and with all the glories of the panorama of the valley—a seeming confirmation of St. Bernard's statement that the founders "searched out damp and low-lying valleys wherein to build their monasteries." Much difficulty exists with respect to the founding of Cymmer Abbey, but Mr. de Grey Birch has shown that it was entered in a contemporary

roll of Cistercian abbeys, thus: "1193, de Kemer (in Cambria XX.)." The founder cannot be conclusively determined. The known documents, the list of abbeys, and the site all agree that the house was one of the Cistercian order, but strange to say the buildings do not agree in this respect. The ground floor of the church is all but perfect, but the usual arrangements of a Cistercian abbey cannot be traced. Instead of the cruciform minster, with transepted chapels and central tower, we have a continuous nave, distinct traces of a continuous north aisle, the anomaly of a western tower opening into the nave, and the continuous north aisle opening into the church by arches only at the western extremity of the nave, and which was elsewhere entered only by irregular openings into the eastern part walled off from the western. The south side of the church, now much ruined so far as the nave is concerned, has some irregular openings into apartments (of which there are no remains) outside the church. A roughly-walled orchard affords space wherein to expect the conventual buildings constructed around a cloister garth, but no traces of edifices exist. The house was always a very small one. The western tower is the only example of such an arrangement known in Great Britain—exclusive of that at Furness, which is a late erection on a towerless west front. After careful examination of the architectural features, the lecturer had come to the conclusion that it was a part of the original building. The whole abbey agrees in style, and cannot be ascribed to an earlier period than the end of the 13th or beginning of the 14th century. The three lancets of the east end appear at first sight like Early English work, but are no older than may have arisen from the usual course of commencing at the east end and completing at the west. The lancets have the peculiarity here, as at Valle Crucis, of commencing at a level remarkably close to the paving in proportion to the size of the church. The abbey is of the slaty stone of the district, not too well built, with dressings of freestone. The numerous small square openings could not have all been putlog holes. They passed quite through the walls, and he suggested that, as the windows were all fixtures, they might have been intended for ventilation. After pointing out the architectural features of the abbey Mr. Brock quoted from the letters patent of King Edward I., in which the monks are spoken of as being "of the Cistercian rules, and living regularly under the rule of Benedict, our patron," and asked whether some association with the Benedictine order would not explain many of the difficulties of the ground plan.—After the reading of this paper an adjournment was made to a building (now inhabited), known as the "Abbot's House," where Mr. Chas. Wynne, of Peniarth, gave further details as to the history of the abbey and its descent through the Vaughans to the present owner, Miss Lloyd. The abbey was locally known only as Vanner, and so it appeared on deeds and charters as far back as about Elizabeth's reign, before which time it was written Cymmer or Kemer.—A long discussion took place as to the date of the lofty room in which the company were assembled, Mr. Bloxam holding that its capacious fireplace and chimney, as well as the square chimneys, showed it to be posterior to the Dissolution. As to the roof (a fine 15th century one, blocked up near its bridge by plaster), that might, as tradition said, have been removed from an earlier building. Mr. Wynne said no post-Reformation dwellings in Wales had halls so high as this; besides, it had only been inhabited by the dowagers of the Price and Vaughan families, and could not have needed so large a kitchen. Mr. Talbot believed that the fireplace as well as the windows were alterations made at the same time that the old roof was blocked up. After considerable discussion, in which Messrs. Wynne, Brock, Grover, and other members took part, an examination was made of the exterior of the room, which was generally considered to confirm the view that the shell of the building is part of the ancient abbot's house. Near the south entrance to the premises, Mr. Bloxam pointed out the guest-house, now used as a stable. On returning to the abbey church,

Mr. Talbot pointed to various puzzling features in the church, which appeared to indicate an earlier origin than 1200. Some mouldings and a sedilia cap had a strong Norman feeling. It was pointed out by Mr. Brock that corresponding members were different, and he argued for a common origin for all, except a tomb recess in the south wall of chancel, which all agreed was of Henry VII.'s time. Mr. Wynne mentioned that a column had been recently taken from between the sedilia by the children of a neighbouring squire, and an opinion was expressed that it ought if possible be recovered and replaced, and repairs executed to prevent the ruins from further decay. These suggestions Mr. Wynne promised should be considered, and if thought advisable, acted upon. On the way back to

DOLGELLY,

the site of the mansion of Hywell Sele, who was murdered by Owen Glendower, was seen. On it stands a modern house. The ancient oak tree, in the hollow of which Owen is said to have concealed the body, was long identified with one in Nannau Park, close by, which fell about 60 years since. Its site is marked by a sun-dial. Dolgelly itself has not much to detain the archæologist. It is but a large cluster of low houses built of a dark grey stone, arranged in narrow lanes and open squares. The old Parliament House, in which Glendower is said to have assembled his council in 1405, before advancing to attack Henry IV., is being pulled down to make way for a block of public buildings. It is a low stone and timber building within a "sagging" tiled roof, and is situated in a passage near the centre of the town. St. Mary's, the parish church, was rebuilt in the Georgian days, and has been lately restored. The only interesting feature is the sepulchral effigy of a knight dressed in studded mail, said to have been brought from Cymmer Abbey. The inscription on the hordure of the shield shows that it is one of the Vaughans, who is identified with a member of the family that died during Edward IV.'s reign, and both the character of the monument and the mouldings of the recess in Cymmer chancel support the theory.

LLANDERFEL AND PALE.

At Bala station a short stay was availed of for the inspection of a tree-planted mound which lies at the angle of land where the Dee issues from Bala Lake. It was generally agreed that this, and the series of similar small hills seen from the railway on the banks of this stream, between its source and Glyn-dyfrdwy station, are in most instances of glacial or alluvial origin, and that they have been escarped by the inhabitants of the district. The last visit was to Llandderfel, where the little village church, recently in great part rebuilt, was examined. It is of the usual type, the nave and chancel being divided by a perpendicular rood screen, of which the canted-out head of panel work has been, in comparatively modern days, set back vertically over the beam. The roof is like that of the disputed room at Cymmer Abbey, but less ornate. Outside are some grotesque gurgoyles. Messrs. Brock and Breeze called attention to the chief features, and gave the history of the ancient and venerated wooden image of Saint Derfel, which, as there had been a prophecy that it would set a forest on fire, was sent by the villagers to London, and employed for lighting the flames under Dr. Forrest (father confessor to Catherine of Arragon), who was burnt at Sheffield. A wooden pastoral staff, and horse of rude workmanship, are shown in the porch; the former was pronounced to be of 14th century workmanship, and, probably, to have been that held by the image. The members then crossed the Dee and railway to Palé, a modern mansion, Italian in style, built in 1870 for Mr. Robertson, M.P. (who acted as his own builder), from designs by Mr. Poulteney Smith. In the grounds a singular stone slab, upheld on slate-slips, was the subject of a discussion. The capstone is a massive slate about 13ft. long by 4ft. to 5ft. broad, and nearly a foot thick, supported on thin layers of similar slates; it stands just beneath a low cliff face. Dr. Margoliouth considered it to be a kistvaen from which the mould has been washed away; Mr. Breeze showed that it differed from all

others in North Wales by having a central pillar; and Mr. Tom Burgess contended that it was merely an accidental fall of stone. The general opinion was that it was a cromlech or kistvaen, formed of readily accessible materials from the cliff above. The members having partaken of refreshments offered by Mr. Robertson, returned to headquarters. At the evening meeting, held in the Assembly Room, papers were read by Mr. S. I. Tucker (Rouge Croix), on the Arms of the Principality of Wales; by Mr. Compton, on the Ancient Welsh Towns and Statues; and Mr. W. de Gray Birch described the collection of local MSS. and records which have been brought together.

SATURDAY.

This day was devoted to visits to the Vale of Clwyd by special train. At

DENBIGH

The castle, one of the largest ruins of a defensive structure in the kingdom, was at once visited, the mayor's hospitality being enjoyed there. The outer walls enclose part of the town, together with the head of a rocky hill, and are hollow, the space between the faces of masonry being grouted. The remains exhibit the features of an Edwardian fortress distinctly. The principal gateway is flanked by octagonal towers, once, as Mr. Tom Burgess showed, defended by long buttresses, so that stones or lead, dropped from the loopholes above, would clear the moat and fall on besiegers on the earthwork. Between there is a pointed doorway house, above it a square panel, in which is a niche, occupied by the headless statue of the founder, Lacy, Earl of Lincoln. This gateway leads through an octagonal chamber into an inner bailey, surrounded by the dwelling apartments of the soldiers. Mr. Loftus Brock remarked that this was, from the date of its erection in Edward I.'s time, always held as a garrison. It was one of the three last to hold out for the Royalists in 1646-7—Holt, near Wrexham, and Harlech being the other two; and Charles II., by way of showing his gratitude, ordered that Denbigh and Carnarvon (also obstinately defended for his father should be demolished and the materials sold, but the order was not fully carried out. Mr. Tom Burgess explained the plan of the castle and its surrounding buildings. The castle now belongs to the Corporation, who have laid out the grounds as a place of recreation. Some suggestions were offered the mayor by architects in the party as to the best mode of preserving the fragments of the castle from further dilapidation. In the outer bailey is the shell of a large church, commenced in 1579 by the Earl of Leicester, but never completed; it consists of nave walls, with tiers of four-centred and circular windows in two stories. Still nearer the castle is the modern garrison church of St. Hilary, which has been disused for a few years past; the windows are boarded up and the whole neglected, but it is said to contain some good Late woodwork. Before leaving Denbigh many of the members visited the new church of St. Mary's, and examined the reredos, widely known in consequence of the lawsuit raised as to its dedication; it was designed by Sir G. G. Scott, and is in three panels—the gathering of the manna and the grapes of Eschol being arranged on either side of a representation of the Crucifixion, the figure of the Saviour standing out in half relief. Near the station, and in a small public "place" set off from the street, is a pillar of considerable height, having on the top a statue of Dr. Pierce, the public-spirited Mayor of Denbigh, who has been instrumental in providing a water supply and drinking fountains, and otherwise benefiting the borough. The monument is from the designs of Mr. Underwood, and is being erected (for it is not quite completed) by Mr. Rudlan Jones, of Rhyl.

RUTHIN CASTLE

Was the next feature of the programme, and they were received by the Hon. Mrs. West. The south side of the castle is modern, and is now the residence of the Hon. Cornwallis West. Its architect, Mr. Henry Clutton, has skilfully grafted it on to the older building without attempting restoration. Both are of red sandstone, quarried in the neighbourhood, that of the ancient castle having been quarried from

the moat. A circuit of the building was first made, and showed that there are considerable remains of the older buildings, although the chapel, keep, and principal entrance have disappeared. A plan made in Elizabeth's reign, a copy of which was exhibited, shows that on the east front was an acute-angled bastion, and that the remainder of the castle (as can be seen from the remains) followed the usual plan of a parallelogram, strengthened at the angles with circular towers. These, as Mr. Brock mentioned, had in the fifteenth century been shorn of their high roofs, and otherwise adapted to meet the requirements of artillery warfare. On the north side are two circular turrets, which protected a sallyport; opposite the north-west angle stood the castle mill—a very important accessory to a mediæval garrison. The members went into the subterranean "dungeons," but it was shown that the name was erroneous, for the doors opened outwards from the jambs, and were too numerous. These substructures were nothing more than the store-houses, and the theories of the labours of prisoners, formed from the rude figures of crosses, birds, and other devices, are contrary to the facts. After a rest and refreshments, alike grateful after a week of travelling, the visitors examined the pictures, armour, and tapestry, and a choice collection of antiquities and works of art in the saloon, wherein Mr. G. R. Wright read from a privately printed work a history of the old castle, showing that it was founded by Edward the First, assisted by Reginald de Grey, in 1281, and that it was besieged and nearly destroyed during the Civil Wars. It passed from the De Greys to the Crown, and after several changes into the hands of the Myddletons, from whom it came by marriage to the brother of the present possessor. During the hurried return to the station a hasty visit was paid to a small mansion in the chief street; the front door opens into a good example of a Jacobean galleried hall leading into a room, panelled, and now filled with family portraits.

In the evening a meeting was held, at which Mr. C. LYNAM read a paper entitled "Notes on Early Monumental Sculpture."

ST. ASAPH'S CATHEDRAL.

Some members diverged at Ruthin to visit the cathedral church of St. Asaph—an edifice exceeded in size by all other cathedrals, and very many parish churches in England and Wales, but well worthy a visit if only to note the solidity and massiveness of effect produced by a large and plain square tower set into a compact cruciform structure. It has suffered from fires in 1282, and again in 1404, and no part appears older than the former date, except, perhaps, the bases of the piers; these are remarkably plain, being continued into the arches without intervening caps. Most of the work is of a simple type of Early Decorated. The top of the tower was blown down in 1714, and repaired by Bishop Wynne, who used for his patching and parapets a local red sandstone that contrasts with the greyer material of the older work. The cathedral was restored prior to 1869 by Sir G. G. Scott, and appears now in excellent repair, and well tended. The dignity it would otherwise possess is somewhat impaired by the modern wooden-vaulted ceiling, which, though preferable to the former flat ceiling, is too low and wanting in substantiality, and the lean-to roof of the aisles to nave. By the way, one recognised in the tracery of the east window a replica of the very graceful one occupying the same situation in Tintern windows and found that it was copied from that example a few years when filled with memorial stained glass—a fact which does not speak highly for the originality of the artist or the committee.

An examination was subsequently made of Rhuddlan Castle, a quadrangular Edwardian fortress, with circular towers at the angles and two others flanking the entrance.

On Sunday evening Dr. MARGOLIOUTH preached a special sermon before the members of the Association in Llangollen parish church from Ps. xlvii., 10 v. (first clause), in which he explained the ancient ritual in the Temple of Solomon.

MONDAY.

The Congress proceedings were closed by a visit to Mostyn and Holyhead, some of the members leaving Llangollen, notwithstanding

the steady down-pour, by an early train, so as to judge of the effect of Sir Gilbert Scott's restoration of Chester Cathedral. Soon after leaving Chester the ruins of Flint Castle, two low circular towers of crumbling red sandstone, connected by irregular walling, were seen on the marshes of the Dee, close to the station; closer inspection shows that the remains are utterly neglected, and will become disintegrated beyond remedy in a few more years.

MOSTYN HALL.

Here the members were received by Lord Mostyn in the hall, which has been rebuilt on the old lines, and with the former woodwork—a necessity owing to its threatening condition—so carefully as still to show an admirable example of the principal room of an Elizabethan mansion. The minstrel gallery opens into the buttery and serving rooms, and has well-carved balusters of smaller pattern than those of the gallery in Rûg chapel. Beneath it is a raised dais. In the hall—which was used as the common dining place of the household down to the end of the last century—are a large richly-carved cabinet, a massive table and forms, all of oak, worked in the Jacobean period; and hanging upon the walls is a collection of armour of the last Civil Wars. A curious feature is a large circular shield of the First Pretender, used in 1715. It has the white rose in the centre, and around it in three concentric rings the arms of the families supposed—in several cases without foundation—by the Pretender to be favourable to his cause. On the margin is the inscription in English, French, and Welsh, "Under the Rose be it spoken." On the dais stands a hollow basin, formed of the root of a tree. This was found at Dinas Mawddwy nearly a century ago. The bowl is 11in. across and 3½in. deep, and seems to have been formed by ruder means than a turner's lathe. On one side is a smaller and shallower excavation, 3in. across and 1in. deep. The log or root itself is 22in. in diameter and 10in. deep. On the top are some rudely carved representations of the mistletoe, and the word "Athrywyn," said to express "happiness or tranquility." It is supposed to have been an early font, and the smaller hollow was used for oil or salt. Lord Mostyn afterwards conducted his guests over the mansion, the greater part of which dates from 1633, but part has been added by the present owner. It is notable among country seats for the numerous family portraits with which every room is hung, and for those of the Royal Charlesses by Vandyke (one apartment is adorned with a series of paintings representing Charles II.'s beauties), but chiefly for its well-stocked and valuable library. In this department Mr. W. de Grey Birch delivered an address in which he remarked that on its long lines of shelves was the finest collection of ancient manuscripts gathered together in any building in England except the British Museum, being especially rich in Welsh books. Amongst the parchments was one granted by Charles II., which, after stating that the wandering and unskilled minstrels have become a nuisance, grants authority that candidates shall be examined at Caerwys. This possesses historic interest as marking the cause and date of origin of the modern Eisteddfodau. The rooms are wainscoted with oak panelling, treated in three modes, that with the plain chamfered styles predominating. The chapel has a wooden barrel vault, and although now having square heads and diamond heads appears to be a pre-Reformation adjunct to the hall. In the wall near by was seen the window, now walled up, through which Henry Tudor, then Earl of Richmond, escaped a party of Richard III.'s soldiers and made his way to Bosworth—a chain of events that secured him the English Crown. Separated by a gravel walk, the visitors saw a second building, intended when built in 1576, to be completed by a wing uniting the old and new parts into a quadrangle. It is now used as offices. Before leaving, a vote of thanks was passed to Lord Mostyn for his hospitable reception, on the motion of Mr. Brock.

HOLYWELL.

St. Winifred's well and the chapel above were the great attraction here. The former is a deep spring that rushes up with sufficient volume to turn some mills on its course to the Dee. It

is enclosed in masonry, and above it springs a lofty well-cover of great richness, consisting of a groined and vaulted stone ceiling, with central fan pendant, the whole being supported on seven pillars arranged in a circle. The well is the property of the town, but is rented by the Local Board of Health to the members of a Roman Catholic community, who have erected small sheds and other accommodation for bathing exacting a fee from every person availing themselves of it. Whether a local authority has the legal right to allow access to the well to be thus restricted is a matter which might, with advantage, be tested. Close by the well side is a large collection of crutches and children's boots, presumably left there as votive offerings by those who deem themselves to be cured. It was stated, however, that the waters have recently been analysed, and found to be of remarkable purity, second only to one sample of well water previously tested by the examiner. Above the well, and supported on pillars, is a chapel, now used as the Sunday school of the parish church, and for Welsh services. It consists of a nave and north aisle of four bays, and an eastern semi-octagonal apse. Denuded of furniture, overlaid with whitewash, and with commonplace windows inserted in the aisle, it yet has some traces of a Decorated chapel, almost rebuilt in Late Perpendicular style. One or two bosses have not been removed from the flat-panelled oak roof, and the stone corbels supporting the springers are fairly carved. Mr. Loftus Brock delivered an address in the chapel, in which he repeated the legend of the miraculous springing of a well where the head of St. Winifred fell to the ground when struck off by her persecutors. The worship of this well probably dated from a period long anterior to the introduction of Christianity, and the hypocast and other remains found in the neighbourhood indicated that the Romans, as in other towns, availed themselves of its properties. He had found on inquiry that the popular belief in its healing virtues had by no means died out in that locality, but was rather on the increase. The beautiful groined roof of the substructure and this chapel were rebuilt on an earlier foundation in 1495, by Margaret Countess of Richmond, mother of Henry VII. Before ascending the hill to the main street of Holywell we peep into the parish church of St. Winifred, which stands on a directly eastward line, and close to the chapel. It was almost rebuilt in 1769, and exhibits all the gracelessness of that period—heavy galleries inclining to a low angle with the floor, flat ceiling, plainest of windows, and plenty of plaster and whitewash. The only respectable feature is the large tower, but this is little more than patchwork. The rector (the Rev. Mr. Williams) mentioned that Mr. Thomas Wyatt, of London, has made a report upon and drawn out preliminary plans for the rebuilding and rearrangement of the church (which is in a somewhat dangerous condition), adopting the old Transitional piers yet standing, as the key for treatment. Mr. Wyatt suggests that the lowest estimate for securing the stability of the building would be about £2,000.

BASINGWERK ABBEY.

The ruins of this Cistercian abbey were visited just before returning to Holywell station. They consist of a few broken walls, containing windows, in which are no visible mouldings, and some heaps of stones and mounds, the whole occupying an uninclosed waste corner between tramways, a paper-mill, and the village street—surroundings as incongruous, and as likely to involve their speedy obliteration as it is easy to imagine. Plans of the probable arrangements of the conventual buildings, together with descriptions of the abbey, were given in the BUILDING NEWS in the autumn of 1873, by the Rev. E. C. Mackenzie Walcott, on September 29th, and by the late Mr. Edmund Sharpe, on October 29th. Mr. Brock described the remains; we hope to give an abstract of his paper next week.

THE CONCLUDING MEETING

of the Association was held, in the Llangollen Assembly-room, in the evening; Mr. Thomas Morgan (hon. treasurer) in the chair.

HARLECH AND CRICCIETH CASTLES.

Mr. J. DILLON CROKER read a paper written by Mr. F. G. Westmacott Chapman, upon these sister fortresses in Cardigan Bay. That of Harlech is of British origin, and crowns a rocky eminence the base of which was formerly washed by the sea, but now looks upon a tract of reclaimed land. Numbers of Roman coins have been found in the neighbourhood, and it was probably held by them, although the nearest known station, that of Segontium, was 29 miles distant. The original building is said to have been erected in the third century by Brozawen, wife of Matholwch, King of Ireland, and was enlarged about 550 by the British Prince Maelgwyn Gwynedd. The whole of the present castle was erected in 1282 by Henry de Elfraton, who was also the architect of the castles of Conway and Carnarvon. In 1401 Harlech was taken by Owen Glendower, and held by him for four years. The most memorable incident in its history is the brave defence made by the little garrison (1459-68) under Dafydd ap Ifan ap Einion, who only surrendered after a nine years' siege by Edward IV. The stirring "March of the Men of Harlech" dates from this memorable siege. During the struggle between the Royalists and Parliamentarians Harlech was held, sometimes by the former, and sometimes by the latter; eventually it was surrendered to Lieut.-General Mytton, on March 30th, 1647, being the last castle in North Wales that held out for Charles I. The plan of the building is quadrangular, with a round tower, surmounted by a lighter one at each corner. On the land side are the remains of a deep fosse, over which was a drawbridge between two high towers, rendered more secure by three high portcullises. In 1692 a golden torque was dug up near the castle, and is now in the collection at Mostyn Hall. The Castle of Criccieth appears also to have been of British origin, and is stated to be the most ancient Welsh castle remaining. Two of the towers are round, and are said to have been built by Edward I., but as they correspond internally with the other two square towers, it is probable that he merely "cased" them. It was never a very extensive building, but was surrounded by a double fosse and vallum. It is best known as the prison of Gruffydd ap Llewellyn in 1239, and as afterwards, in Edward III.'s reign, of the valiant Howel-y-Fwyell of Bron-y-fel, who exhibited prowess with his mighty battle-axe at Poitiers. The author concluded with an eloquent testimony to the bravery and loyalty of the Cymry, both to their British princes and subsequent monarchs.

Dr. PHENE gave the results of investigations he had carried on during the past week in Sarphele, a little village about six or eight miles from Llangollen over the Berwyn mountains. The name suggested a connection with serpent worship, and investigation showed a remarkable ridge of exposed quartz in the form of a huge Saurian, crossed by an ancient camp, fir trees arranged on the same (perhaps traditional) plan, and also the existence of a singular tradition about a sleepless smith and the mystic brazen image he fashioned, much resembling that current in Scandinavia.

Mr. W. DE GREY BIRCH then gave a *résumé* of the Congress proceedings. Although the work of the past eight days might not appear to have been considerable, yet to him the total results achieved in so many directions appeared almost incredible. Of fortified dwellings they had heard of or seen specimens of almost every age, including the cave huts of which Dr. Margoliouth had spoken, the numerous entrenched camps, Offa's and Wat's Dykes, and the mediæval castles raised on more ancient banks at Dinas Brân, Caerwrlle, and later examples at Denbigh, Chirk, and Ruthin, the last two yet inhabited. The three religious houses examined had been all of the Cistercian order, but they had seen at least a dozen churches, from the traces of Norman at Corwen to the Jacobean at Râg, and eighteenth century work at Dolgelly. Of domestic dwellings they had seen several examples, including the site of Owen Glendower's house and Mostyn Hall. Of the monumental remains the most interesting had been the three pillars, the first that of Eliseg, which

he thought to be Roman in workmanship, but lettered with an inscription in the small so-called Irish writing of much later date than the occupation; he others were Glendower's sword at Corwen, and the churchyard cross at Râg. At Gresford they had seen some fine glass in the north chancel aisle, dated 1498, and a good east window, while at Plas Newydd they had seen a great deal of wood carving. Having alluded to the collections of manuscripts, Mr. Birch concluded by an allusion to the fact that archaeology was every year splitting into a greater number of branches, and that more would be accomplished if every student set himself to some definite part of a special line of inquiry.

The proceedings terminated with the usual votes of thanks to all who have promoted the success of the Congress.

TUESDAY

Was an extra day, devoted to visits to

OSWESTRY AND LLANGEDWYN.

On arriving by special train at Oswestry, the members separated into two parties. The larger number proceeded by invitation to the seat of the President at Llangedwyn, on the river Tanat. The mansion was built in the later years of Charles II., and is of advanced Jacobean style, with pronounced Queen Anne fenestration and woodwork. Amongst the contents are a valuable collection of ancient MSS., and a gold torque found on Cader Idris, and supposed to be the largest of its class extant (about 40in. circumference). The adjacent village church of St. Gedwyn has been restored, and now appears uniformly Early English in style; the mouldings and details are of a simple and refined character.

The second section devoted the day to more earnest work in and around Oswestry. The members first went to the ancient well, about which there was nothing remarkable, except that it bears the name of the Saint, King Oswald, who was killed here during the 7th century. They visited many half-timbered houses, especially examining one at the corner of the main street, now used as a bank. It is of the 14th century, and exhibits some fine woodwork, especially in the oriel window, and the arms of the Fieldings, Earls of Deubigh, upon the chief front. The plaster which disfigured the quarterings has been carefully removed, and the whole skilfully renovated. The parish church was restored a few years since by Mr. G. E. Street, R.A. It is a very large structure, with several aisles added at various dates. The whole of the tracery appears to have been renewed, but some of the stained glass is ancient and excellent. The chancel screen is adorned with quatrefoil ornament, and has a stoue base. The chancel is of later date than the nave, and built of a different kind of stone. In it is a fine monument to one of the Yale family, temp. James the First. The great feature of St. Oswald is the noble square tower. The upper part of it had been destroyed during the Civil Wars, and is replaced by a story, finished with a balustrade of the Queen Anne period, the south-west angle turret being also raised and ornamented in the same manner. The tower is partly covered with ivy, and the whole composition (incongruous as the admixture of Perpendicular and Renaissance may be) was pronounced by Mr. Loftus Brock to be "charmingly picturesque." Under the guidance of Mr. J. Tom Burgess the party proceeded to Old Oswestry, which consists of numerous concentric oval-shaped entrenchments, flanked on the east and west sides by Offa's and Wat's Dykes. The outer vallum encloses an area of nearly 60 acres. While pacing the ramparts on the west side a series of ten circular cavities were noted, which it was suggested were ancient cave dwellings. Eight of these are above and two below a gap in Offa's Dyke, supposed to be left as an entrance. The members of this section separated about 6 o'clock, feeling that the additional day had not been the least productive or pleasant of the Congress proceedings.

It is probable that the Association will make Leamington the headquarters of next year's Congress.

ST. ALBAN'S ABBEY.

FOR some weeks past workmen have been busily engaged in excavating the floor of the nave, and around the bases of the great piers of the south arcade; these latter spaces have been filled with concrete as a preparatory measure to the erection of the ponderous trusses and shoring with which it is intended to lift off the roof. At the junction of the early English work of Abbot Trumpington with that of the Decorated of Abbots Hugh de Eversden and Richard Wallingford, the roof will be severed, and by means of powerful screws the western portion, about 120 feet long, lifted off the walls. The next proceeding, after centring all the arches with massive timbers, will be that of forcing the whole mass of Trumpington's work, the triforium and clerestory, with all its beautiful arcades, to an upright position. As this wall now leans over 2 feet 4 inches towards the south, and is upwards of 80 feet in height, some anxiety is manifested as to the success of the undertaking. Iron ties from north to south will be inserted in two tiers through the spandrels, with coupling screws in the middle, as were so successfully used in repairing the great central tower; the three tiers of raking shores already in position will be added to considerably, and four hydraulic rams will be used simultaneously with powerful screw-jacks and other mechanical appliances, to move the great mass. Raking shores will be applied inside the building at every vantage point, and two enormous horizontal trusses, the whole area of the section of the nave under repair, will be placed at the heights of 30 and 50 feet respectively, in order to regulate the distance to which the arcing is to be forced. Every precaution is being taken to render the bold undertaking a successful one. After the wall has assumed its upright position the roof will then be lowered on it in its proper place, and meanwhile four flying buttresses will be constructed to keep up the work so moved. These buttresses will be very massive, the abutments above ground projecting no less than 9ft. from the south wall, with, of course, foundations far beyond. In excavating for the westernmost of these the workmen have unearthed the foundations of one of the great western towers, which was begun to be built by Abbot John de Cella, about A.D. 1209. The whole of the five western bays of the south aisle are to be groined as of old, the former groining having been destroyed, and the roof of this aisle is to assume its ancient high pitch. After these works are completed, the next section to undergo repair will be the four bays of the nave next eastward. The piers here of Hugh de Eversden which were erected after the great fall of this portion of the abbey in 1323, show signs of weakness, being split vertically in many places. At present, as a precautionary measure, and with the view of preventing danger from any possible additional weight being thrown on them, it is intended to grip them with trussed balks, strongly bolted together.

With all these works the restoration of the dilapidated western front must not be lost sight of. Here were once to be seen three grand porches, the like of which for architectural beauty were not to be found in the kingdom. The great central porch is in fair preservation, and with some repair will again be secure; but the two flanking porches, now hidden from the public by the hideous blocking up of their fronts, are in a sad state of dilapidation and decay.

The Leekie Memorial Church, at Peebles, was opened on Friday last. The architecture of the church is Gothic of the fourteenth century, and it has a spire which rises to the height of 146 feet. The church, which is seated for 500, has together with the ground, cost considerably upwards of £7,000.

Preparations for the dismantling of the north side of the parish church of Market Rasen, and its enlargement, have been commenced by Mr. H. Scupham, the contractor. The alterations will cost between £400 and £500.

Last week a new Early English Unitarian church, in Falsgrave-road, Scarborough, was formally opened. It is capable of seating 300 persons, and was designed by Mr. C. A. Bury, architect, of that town. It consists of nave and spired tower, with schoolroom attached. The material is red brick, with white stone dressings. The estimated cost is £4,500.

ILLUSTRATIONS.

CONVENTS OF NAZARETH AT NORTHAMPTON—TOWER OF ST. GILES CATHEDRAL, EDINBURGH—ST. PAUL'S CHURCH, MANCHESTER—THE WALKER FINE ART GALLERY, LIVERPOOL—HOUSE AT WESTERN HILL, DURHAM.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE WALKER ART GALLERY, LIVERPOOL.

It having been felt for many years past that Liverpool much needed a building for a permanent exhibition of pictures and works of art, a movement was set on foot by Messrs. Picton, Rathbone, Samuelson and others, for erecting such a building by voluntary subscription; but although numerous sums were promised, they were insufficient for the object in view, and there was every prospect of the project falling through, and of Liverpool being without a public picture gallery for some years to come, until the present Mayor, on taking the mayoral chair in 1873, announced his intention of presenting the town with an art gallery at a cost of £20,000. The foundation stone of the building was laid on the 28th of September, 1874, by H.R.H. the Duke of Edinburgh, and was opened on the 6th of this month by the Right Hon. the Earl of Derby, K.G. The building is of Cefn stone, and in the Corinthian order of Classic architecture. A flight of twelve steps leads up to a portico which has six fluted columns supporting a pediment and attic. The façade, surmounted by a medallion cornice and open balustrade, extends 70ft. on either side of the portico, making the total frontage of the building to William Brown-street 180ft. Above a fretwork enrichment running round the building are panels, in which the following subjects will be carved in bas relief:—1st, King John granting a charter to Liverpool; 2nd, William III. embarking at Hoylake; 3rd, Queen Victoria's visit to Liverpool; 4th, Laying the foundation stone by Duke of Edinburgh. On the right-hand side of the steps to entrance is a statue of Michael Angelo, and on the left a statue of Raphael; above the portico is a figure representing Liverpool. These figures, which are of white Carrara marble, have been executed by Mr. J. Warrington Wood, of Rome, and are greatly admired by all art connoisseurs. The main doorway under the portico opens into a hall 40ft. x 30ft., with a floor of encaustic tiles laid by Messrs. Minton, Hollins, and Co. On either side of the hall are rooms 70ft. x 30ft., with inner rooms 46ft. x 35ft. These rooms are intended for an art museum. Retiring rooms for ladies and gentlemen are provided on the ground floor. The upper hall is reached by a double flight of stone steps 12ft. wide, and the floor is laid with parquetry by Messrs. A. and J. Arrowsmith, of London. The rooms opening from this hall, and which are lighted entirely from the roof, are intended for picture galleries solely, and are of similar dimensions to the rooms below. There are four other rooms on this floor set apart for water colours, miniatures, and gems. The building throughout is heated by hot water. The ventilation is secured by flues carried up the walls with gratings over cornice and Archimedean-screw ventilators in roof. Mr. Cornelius Sherlock, of Liverpool, is the architect, and the sole contractors are Messrs. Haigh and Co. As the area of the land is limited, the building has necessarily been brought close up to the street to admit of future extension in the rear.

HOME AND CONVENT OF NAZARETH AT NORTHAMPTON.

This convent and home is being erected for the Sisters of Nazareth, for the reception of the aged and infantine poor of this district. The Home provides for 100 inmates, and comprises chapel, class-rooms, and refectory for the children, infants' room, sisters' refectory, community room, and rev. mother's room; day-rooms for the old women and for the old men, and bedrooms and dormitories, kitchens and kitchen offices, bath-rooms, &c. The work is being carried out in local stone, the roofs being covered with plain tiles from Staffordshire. Mr. Thomas Cosford, of Northampton, is the builder, who is executing the work under the supervision of the architect, Mr. Francis W. Tasker, of 7, Furnival's-inn, E.C.

HOUSE, WESTERN HILL, DURHAM.

This is a design for the enlargement of a house on the Western Hill, Durham. The old house only being one room deep, with a room projecting at the back, it seemed best to clear away that room and build the whole breadth up. The large bay is provided to give a good sight of the Cathedral, which a flat window could not do. The gable front between the party walls is to be framed pine, filled with thin red brick and plaster—the roof covering to be small slating—the windows would be part leaded, as shown, the lower parts being plate-glass in casement—the upper compartments of transom windows to swing on pivots. The sitting-room fireplace would be stone, but the drawing-room would be wood, with tiles inserted round the grates. Mr. J. Shields, of Durham, is the architect.

ST. PAUL'S CHURCH, MANCHESTER.

We described this church, which has been erected from the designs of Mr. John O. Scott, when we illustrated its exterior in the BUILDING NEWS of September 10, 1875. We now give an interior view. The building is approaching completion, and will be opened early next year. The upper part of the tower, which was excluded from the contract, has just been commenced. The total cost will be £16,000. The view which we give is intended to show the character of the decoration, which it is hoped may be undertaken before long. Messrs. Collins and Cullis, of Tewkesbury, are the builders.

TOWER AND LANTERN, ST. GILES' CATHEDRAL, EDINBURGH.

The church of St. Giles dates as far back as the beginning of the 12th century, since which period it has undergone numerous additions and alterations, so much so that its earlier characteristics have entirely disappeared. The date of erection of the lantern is not quite certain, but is supposed to have been about the middle of the 15th century, at which time the roof of the old church was raised, and a clerestory added. In 1571 the church was forcibly taken possession of by Sir William Kirkaldy, of Grange (in the interest of Mary, Queen of Scots), who placed in the steeple "three pieces of brass ordinance" with which to assist in holding the city against Regent Murray's forces. It was not till 1633 that Charles I. caused St. Giles to be constituted a "cathedral church, according to the first intention of the erectors and founders thereof." In 1648, owing to the dangerous and ruinous state of the lantern, the magistrates had it thoroughly repaired, and it is probable that at this time the uppermost portion was rebuilt. Again, in 1829, the whole cathedral was restored and refaced in a style of Gothic possessing no architectural interest whatever, that portion embodied in the subject of illustration being the only part left in its entirety. This species of lantern seems to be peculiar to North Britain, as it does not occur further south than Newcastle, while we find specimens of it still remaining at the Iron Steeple, Glasgow, and King's College, Aberdeen, and until recently it terminated the towers of Linlithgow and Haddington churches. Of all the Scottish examples, that of St. Giles is the richest and lightest, being of an octagonal character, the others being merely formed by ribs springing from each of the four corners of the tower. The cathedral stands on a high ridge of land,

running westward, and terminating with the Castle Rock, and from its elevated position the tower may be seen from almost any part of the city, forming a pleasing and picturesque feature in the view.

THE GRANGE, EAST SHEEN.]

This house, illustrated last week, was lately built as a residence for Henry Vernet, Esq., stands upon an elevated site on the borders of Richmond Park, and overlooks the beautiful Roehampton Valley. The grounds are of considerable extent, and the stabling occupies an outlying portion, having a separate road of approach. The house is built of grey stock brick and Douling stone, and is covered with plain tiles of a brownish-red colour. The internal joinery is of pitch-pine, varnished. The work was carried out by Messrs. Sharpington and Cole, Mr. Thomas Earp executing the carving, and Messrs. Heaton and Co. supplying the stained glass, quarry glazing, and ornamental tiles—the whole from the designs, and under the superintendence of, the architect, Mr. E. Ingress Bell, of 17, Craven-street, W.C.

BUILDING NEWS DESIGNING CLUB.

AS we are constantly being asked to furnish the particulars of the "Club" to those who wish to become members, we herewith republish them.

1. Drawings to be sent in 21 days after the publication of the list of subjects.
2. Three subjects will be given every fortnight, from which list a selection may be made by each competitor.
3. The drawings to be executed in firm black lines on white drawing paper, in sheets of the absolute size of 18in. x 12½in., with no washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching," or blocked in. The scale to be used will be given with each subject.
4. Drawings to be forwarded unmounted, by post, care being taken to toll the short way of the drawing, as packages over 18in. long are not transmissible through the post.
5. On entering the class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing as a guarantee of good faith, the *nom de plume* the author intends to adopt being boldly marked on the front of each separate drawing.
6. Prizes of £5 5s. and £3 3s. will be awarded to the best series of designs, such series not to consist of less than twelve subjects. Our decision to be final.
7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.
8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.
9. A critical notice of the designs sent in of each series will be given in our issue following the receipt of the drawings.

LIST OF SUBJECTS—NO. XIV.

- A. A mixed village school to accommodate 100 children, with school-house attached, for master and his wife. Cost not to exceed £1,000. Material, brick (no stone), with tile roof; plan, two elevations and section; scale, ½in. scale.
- B. An oak staircase for a small rectory, having a hall about 15ft. square; height from floor to floor, 12ft.; plan, ¼in. scale; elevation, ½in. scale and details.
- C. An escritoire in painted wood, with decorations, size 4ft. 6in. by 5ft. high; elevation, or view, and details, 1in. scale, and ¼ full size.

The foundation stone of a new Wesleyan chapel at Winsen-green, near Birmingham, was laid last week. It will be a brick building, 48ft. by 30ft., and will furnish accommodation for about 300 persons. The cost will be about £650. The architect is Mr. G. F. Hawkes, and the builder Mr. Elvins.

FROM THE SUBSCRIPTIONS OF THE

THE MATHEMATICS OF CONSTRUCTION.*

NOTWITHSTANDING the numerous treatises on the theory of strain and the strength of materials, there is scarcely one that is thoroughly adapted to the purposes of the architect. Rankine's manuals are excellent in their way, but they are overcrowded with algebraic formulæ, and are more useful as school class-books than as treatises comprehensible by the average student or man of business; Tregold's, Tarn's, and Hurst's are more adapted for the architect's general requirements, but they are hardly comprehensive enough, and we may search through the recently-published manuals without finding one suitable for the architect's requirements, as distinguished from the wants of the engineer. At last an American architect, Mr. R. G. Hatfield, Fellow of the American Institute, and member of the Society of Civil Engineers, has brought out a comprehensive treatise on the mathematics of construction, expressly intended for architects and students of architecture, and from a perusal of its pages we consider the author has succeeded in furnishing the profession with a reliable and exhaustive handbook on those every-day branches of construction it is so much in need of. Mr. Hatfield, who has consulted upwards of thirty works on the subject—comprising the excellent works of Barlow, Bow, Campin, Fairbairn, Hodgkinson, Humber, Rankine, Poisson, Robison, Shield, Stoney, Tate, Tarn, Tredgold, Weisbach, &c.—admits that few of these works are adapted to the specific wants of the architect. In some of these the subject is treated in the abstract, and in a manner too general for the practitioner, while in more detailed works the wants of the civil engineer, rather than the architect, have been consulted. The result is that the latter is content to forego a mathematical knowledge of the subject, following precedent and trusting to chance. The author has treated his subject methodically, and the various theories and examples are classified under sectional headings, numbered for reference, which is undoubtedly the best mode of bringing any particular problem under the eye of the reader. The contents are well arranged under general heads, and there is a good index, but the most valuable part of the book, as a means of reference, is a directory or digest of the principal rules and articles by which any particular case occurring in practice may be immediately found, from the general conditions which are stated in outline. Every topic or subject is presented first in concrete form, and from thence the mind is led gradually to the abstract principle involved. By this systematic treatment the author has made his work something better than a collection of rules and tables promiscuously jumbled together, and has given it the coherence and method of a scientific treatise. Another useful feature is the questions for practice that occur at the end of each chapter. We are glad to find the author has largely illustrated the graphical representation of strains—a most useful study to the young architect, and one very imperfectly developed in most of the works published. We are led to believe this method of finding strains is very seldom resorted to, from ignorance of the principles. How simple the process is those who have once mastered it know well. Thus, in the case of a lever or half beam projecting from a wall, the moment of rupture is equal to the product of the weight into the arm or leverage at which it acts, and the strains can be measured by scale in the following manner. At the wall end of lever

draw a vertical = to this moment, join the end with the extremity of beam, and the triangle thus formed becomes a scale upon which the strain at any point of the beam can be measured. The graphical strains in a beam, with centre load resting upon two supports at each end, are found by drawing lines from the ends to a vertical made equal in centre to $\frac{wl}{4}$, and any vertical ordinate within the two triangles thus formed will give the strain at that point. The law of resistance is clearly stated, from which the reader is led to the lever principle as the foundation of the whole theory of the subject. The several elements of resistance to rupture are simply explained. Thus we have first the unit of strength of a given material lin. square and 1ft. long; then we have the product of breadth into the depth; and, lastly, the resistance of the fibres to extension, also in proportion to the depth. Putting these several elements together, and representing them by letters, we may say the total resistance, or

$$R = \text{Unit of strength } bd^2.$$

We have, then, the destructive energy of the weight, or the moment of the weight, to go against this resistance, and when the student masters both the sides of the equation, he can at once determine or calculate the strength of any beam, either of iron or wood, by the simple rule

$$Wl = \text{Unit of strength } bd^2.$$

The effect of weight as regards position is clearly distinguished, and the rule for a beam loaded at any point is given, a general formula for which may be thus expressed in words: The resistance of a beam loaded at any point is equal to the weight multiplied into the segments of the length into which the weight divides the beam, and by 4, and the product divided by the length of beam. The effects of distributed loads, the destructive energies of differently-loaded beams, and the relation between lengths, weights, and effects, are shown. After showing the conditions of equilibrium between the destructive energy of the load and the resistance of material at the point of rupture, the author proceeds to apply the factor of safety, without which the rules given are useless to the architect. The author gives the rules for the safe load under differently-loaded beams. When a load is suspended at the end of a lever fixed at the other end, the rule is $4Pan = Bbd^2$; when distributed, it is $2Uan$; when the load is placed on a beam supported at both ends it is Wal ; when it is distributed on such a beam, $\frac{1}{2}Ual$; and when the load is at any other point the rule is $4Wa\frac{mn}{l} = Bbd^2$. In these rules P = weight; a = the symbol of safety = for English timber nearly 4; n = the arm of lever; W = the weight, and l = the length of beam.

The application of the rules to the construction of floors is a very useful part of Mr. Hatfield's treatise. The formula for these is the fourth rule given above. It is shown that each beam in a floor is subjected to the weight arising from so much of the floor as extends to half-way to the adjoining beam, or the weight equals the length of beam by the distance apart of the beams. Knowing the weight or load per superficial foot of the floor, the total load upon a beam will be obtained by multiplying its length by the bearing and by this unit of load, or $\frac{1}{2}acf^2$, in which f = the unit of load and c the distance apart of beams. The unit of load for a floor of a dwelling is put at 20lb. as the maximum, the author working out the details of the beams and plastering. The average weight per lineal foot of white pine beams is put at $6\frac{1}{2}$ lb. We may observe here that the author differs from Tredgold in fixing the weight of a

crowd of people at 120lb. per foot. Taking the investigations of Mr. James Walker, Quetelet, and other evidence, the total average weight of people appears to be 105.5lb., and the greatest weight of a crowd of people is stated to be 66lb. per square foot. Estimated as a live load, however, this figure is increased to 76.4lb. as a moving force, without considering the elasticity of the limbs and the floor, which would reduce it to nearly half this addition. A promiscuous movement of a crowd of people has little effect upon a floor beyond their weight, and Mr. Hatfield describes an interesting experiment made by him at Jackson's foundry, New York, in 1860, which corroborates the above figures. Eleven of the factory men were placed upon the platform of a large scale, 8 $\frac{1}{2}$ ft. by 14ft., and their combined weight showed an average of 139.55lb. a man, a trifle over Quetelet's data. A promiscuous stepping and walking about increased the total weight only 10lb., or barely 1 per cent., but a simultaneous movement, or military tread, increased the weight 159lb., or over 10 per cent., thus showing a result bearing out the former figures. The men were afterwards directed to use their utmost exertions in jumping and violent movements urged on by loud shouting; the effect produced was an increase of 795lb., or 52 per cent., but in a closely-packed room there would be no room for this violent jumping, hence we may conclude 66lb. is the total effect of the most riotous crowd of persons on each foot of floor of a room, or 10 per cent. addition for a bridge through which a solid body of people could march. The greatest load that need to be provided for is thus, say, 70lb. per superficial foot, and therefore floor beams calculated to sustain this load, or to break with not less than four times this, may be considered equal to any emergency.

Thus, for the floor beam of dwellings, the general formula is

$$\frac{1}{2}acf^2 = Bbd^2$$

as regards safety from rupture; but for the sake of preventing excessive deflection the rules for the resistance to flexure are the most desirable for the architect's purpose.

The rules denoting stiffness are more complex—hence they are neglected for those which determine the strength or resistance to rupture. A beam should not only be safe, but appear so, and hence the laws of deflection are more necessary to the architect than those of rupture. Deflection is proved to be directly as the weight and cube of the length. A general rule for beams as to stiffness is given, the rate of deflection being left indeterminate, though $\frac{1}{3}$ in. per foot is considered fair. The deflection of a white pine beam is obtained by multiplying the load in middle by the cube of length in feet, and dividing by 2,900, the average value of the measure of elasticity multiplied into the breadth and cube of depth. To find the depth we multiply the weight in centre by the cube of length, and divide product by the measure of elasticity multiplied by the breadth and rate of deflection. The cube root of the sum will give the depth. When the load is distributed the formula is for deflection

$$\frac{5}{8} \frac{U l^3}{F b d^3}$$

For floor beams the simple rule to obtain the depth is to multiply the distance apart from beam centres by the cube of length, and divide product by the breadth of beam into the value of the particular wood, which for white pine is 1.55, and the cube root of sum is the depth required. A very useful chapter is that on the effect of bridging floor beams, a subject that has been very inadequately considered. By experiment upon a model the author found that a bridged beam sustained more than three times that borne by the unbridged beam. The useful and practical subject of girders,

* Theory of Transverse Strains, and its Application to Building, &c. By R. G. HATFIELD, Architect, F.Am.Inst.A., &c. London: Trübner and Co.

trimmers, and trimming joists, the allowance to be made for the mortising, &c., are entered into, and rules are given. Rolled and cast-iron beams form another useful part of the treatise, the moment of inertia is clearly explained, and examples are given showing the application of the rules. The question of framed girders and roof trusses, with the graphical modes of obtaining the strains, is minutely entered into, and the tables at the end will be found of service. It would have added to the practical and general value of the work if the leading rules had been stated in words, as there are many in the profession unable to understand symbols. Taking the work as a whole we consider it to be one of the best and most thorough treatises on the theory of transverse strains we possess, and we have every confidence in recommending it to the architect and student.

THE LOCAL GOVERNMENT BUILDING CODE.

A SERIES of "model bye-laws" have lately been published by the Local Government Board relating to sanitary regulations connected with building, streets, lodging-houses, &c. The Board have sought for advice from the Institute of British Architects and other sources, and the result has been that a series of bye-laws have been framed that may at least be found to be a provisional step towards a more uniform code of building rules and practice. In relation to new streets it is proposed that they are to be laid out with easy gradients; if for a carriage road the width to be 36ft. at least, and every street exceeding 100ft. in length is to be laid out as one. If less than that length, a width of 24ft. is provided if it is used as an approach to any building. In new streets the carriage-way is to be 24ft. wide at least, and the slope to be $\frac{3}{4}$ in. to $\frac{1}{2}$ in. per foot in width; the footways to slope $\frac{1}{4}$ in. to the foot if not paved, or $\frac{1}{2}$ in. if paved or asphalted. Respecting new buildings, the bye-laws provide that they shall not be erected on a site filled up with fecal matter, or with material impregnated with animal or vegetable refuse. We are glad to find that the suggestion so often urged by us has been adopted, that the area of every house is to have a layer of asphalt or good cement concrete 6in. thick rammed tight. With regard to the cementing medium, mortar of good lime and clean sharp sand is to be used, or good cement. For footings, the usual regulations of the Building Act are followed, half the thickness of wall to be the measure of projection of the widest part on each side; but when an adjoining wall exists, the projection may be omitted. Relating to external party walls, the rules follow those laid down by the Building Act. Thus, taking a wall 60ft. in height, with a length up to 45ft., the thickness of two stories is put at 18in. and the remainder 13 $\frac{1}{2}$ in. If length exceeds 45ft., one story is to be 22in., two stories 18in., and the remainder 13 $\frac{1}{2}$ in. Taking an ordinary case for height up to 25ft., with length up to 30ft., if two stories the thickness to be 9in., if more than two to below the topmost story 13 $\frac{1}{2}$ in., and the remainder 9in. It is somewhat questionable whether these rules were wanted, as the Building Act has given a complete scale. Another rule states that if the height of a story is in excess of 16 times the prescribed thickness of its walls, then the thickness of each external and party wall throughout the story is to be increased to 1-16th part of the height of story, and the thickness of each external wall, and of each party wall below that story, is to be proportionately increased, subject to the provision as to piers. Every external and party wall of any story which exceeds 10ft. in height is not to be less than 13 $\frac{1}{2}$ in. in thickness. Where greater thickness is required in a wall which exceeds 60ft. in height, and 45ft. in length, or in the case of a story exceeding 16 times the thickness prescribed for its walls, or in the case of a wall below that story, the increase may be confined to piers properly distributed, of which the collective widths amount to one-fourth part of the length of

wall. The projection of a pier is never to exceed one-third of its width. For the external and party walls of warehouses, &c., the proposed rules follow pretty closely the schedule of the Building Act; and the provisions for openings, parapets, bond-timber, chimneys and flues, holdfasts, roofs, &c., are in the main a repetition of those in that Act.

Passing on to those bye-laws relating to sanitary objects, the sufficiency of space round buildings, their drainage, &c., we find a few rules that may be useful. Thus, in front of every domestic building, there is to be an open space of 24 feet between the frontage and the opposite lands and premises—this space to be left quite free of obstruction except a portico, porch, step, or projection, not exceeding 7 feet in height. In the rear there is to be an open space of an aggregate extent of not less than 150 square feet, free from any erection except it be a water closet, privy, or ash-pit. The space is to extend laterally throughout the entire width of the building, and any opposite or adjoining premises or lands not to be nearer than 10 feet to any part of the building. If the building is 15ft. high, the distance is to be 15ft.; if 25ft. high the distance is to be not less than 20ft.; and if the height is 35ft. or more, the distance to be at least 25ft. The lowest floors are to have a space of at least 3in. from the asphalt or concrete to the lower side of joists, and the space is to be ventilated by air-bricks. Every habitable room is to have one window at the least opening externally, and the total area of window or windows clear of sash frame is to equal at least one-tenth of the floor area of room; and one-half of the window at least is to be constructed to open—this opening to extend to the top. Every room without a fireplace must have efficient means of ventilation by a shaft whose sectional area shall be at least 100 square inches. Regarding drains we may briefly say, that every damp site is to have the subsoil drained by earthenware field pipes; suitable ventilating trapped connections are to be made; no drain is to pass under a building, except in cases where any other mode is impracticable, and when so laid it is to be in a direct line for the whole distance beneath the building, and be embedded in concrete at least 6in. thick all round, with ventilation at each end. Means of disconnection by means of a shaft-pipe or chamber is to be provided near to a trap, and a second opening is to be made, as far distant from the first as possible, carried up by a pipe to such a height as to prevent escape of foul air into any building, and to be not less in any case than 10 feet high. Closets are to be placed so that one of the sides is to be an extreme wall, with a window of not less than 2ft. by 1ft., exclusive of frame, and one air-brick is to be built in the outer wall, or there is to be a ventilating shaft to give constant ventilation. A separate cistern or flushing box is to be provided for the w.c., and no connection to be allowed between it and any service pipes. D-traps and containers are prohibited.

WORKS IN HAND AT SUNDERLAND.

A NEW line of railway is being constructed through this town, causing a vast amount of old property and works to be pulled down in the centre of the town, in the course of the railways. There is nothing of note or interest except a bridge over the river Wear, within a few yards of the (once) celebrated iron bridge. It is 100ft. above high water mark. Messrs. Waddell, of Edinburgh, are the contractors. Two banks are being built in the town, and a library adjoining one of the banks. The N.P. Bank are building a handsome stone bank in High-street. It is too early to form any decided opinion of it, as the second story is only up; however, it is to be a very costly affair, and no doubt will be an ornament to the town. The block of buildings now in course of erection in the Shrubbery, Fawcett-street, are by far the best, in every point of view, in Sunderland. The town up to this time has been at least a generation behind every other town in its buildings, but these handsome structures have raised the tone of architecture and building construction amongst the people (and especially the professional portion) in a very marked degree. A new county court has also been built.—W. C.

NOTES FROM DUBLIN.

A NEW Catholic church is being erected at Rathfarnham, in the suburbs of Dublin, from the designs, &c., of Mr. G. C. Ashlin, architect, partner of the late Mr. Pugin. It is in the Early English style of architecture, and consists of nave, aisles, two side chapels at east end of aisles, and sacristy. The building is being erected by Messrs. Meade, of Dublin. Another new church (Roman Catholic) has just been finished, except vestries and chapels, at Dundrum, near Dublin, from the designs of the same architect. Excavations are being made on Stephen's-green for the erection of new schools attached to the Wesleyan church in the same locality. The designs are by Mr. Jones, R.H.A., and it is stated that the new works will cost about £1,700. Messrs. Gahan and Sons, of Harcourt-street, have been appointed contractors. The Scottish Widows' Fire and Life Insurance Company's offices have been erected in Westmoreland-street, according to designs by Mr. Thos. Deane, R.H.A., Inspector of Public Monuments in Ireland. A new mansion is nearing completion at St. Ann's, Clontarf, for Sir Arthur Guinness, Bart., under the direction and from the drawings of Mr. J. H. Fuller, F.S.A., architect. There are already five or six skating rinks in and on the suburbs of this city, and it is said that another is about to be commenced at Kingstown, eight or ten miles hence. Two or three of those in the city have long since been closed. One, at the Rotundo, is occupied daily for Evangelical service, at which, it is said, about ten or twelve attend.

COMPETITIONS.

DURHAM.—The Medomsley School Board (county Durham) having advertised for plans of schools and master's house to be erected at Westwood, within their district, received nineteen competitive designs, and awarded the first premium to Mr. Fox, of Durham, the second to Messrs. S. Oswald and Son, of Newcastle, and the third to Mr. Oliver, of Newcastle.

SOUTHPORT.—In answer to the advertisements for designs for new covered markets at Southport, twenty-five designs have been received bearing the following mottoes:—"Bon Accord," "Bona Fides," "Debut," "Dexter," "Excelsior," "Experientia Docet," "Haut et Bon," "In the Market," "Iron," "Luminous Mark It," "H. O. P. F. in a crossed circle, 1877," "Palnam qui Meruit Ferat," "Practical," "Regardez Moi," "Rouge et Noir," "Southport," "Salus Populi," "Sanitas," "Suum Cuique," "Tenez," "Victoria," "Utility," "X. L." They are under the consideration of the market committee, and will be open to public inspection in the large room of the Town Hall after the committee have decided upon the best three designs.

ARCHÆOLOGICAL SOCIETIES.

WILTSHIRE ARCHÆOLOGICAL AND NATURAL HISTORY SOCIETY.—The annual meeting of this society was held last week, the proceedings being opened on Wednesday in the Town Hall, Warminster, by the President, the Marquis of Bath. Some old documents, recently discovered in a lumber room at Pyt House, and lent by Mr. Bennet Stanford, M.P., were exhibited. A paper on "The Vale of Warminster" was read by Canon Jackson, and in the evening papers were read by Mr. W. W. Ravenhill, on "Justice in Warminster in the Olden Time;" by the Rev. H. T. Kingdon, on "An Early Service in the Vernacular;" and by the Rev. A. C. Smith, on "Some Account of the Tavern Signs of Wiltshire and their Origin." On Thursday the members visited Longbridge Deverell, Brixton Deverell, Monkton Deverell, Kingston Deverell, and Mere, and were entertained at luncheon by Miss Chafyn Grove, at Zeals House. Stourton Church, Maiden Bradley, and other places of interest were also visited, and in the evening papers were read by Rev. J. Baron and Sir John Lubbock. On Friday the members visited Longleat, Horningsham, Shearwater, and—by invitation of Lord Heytesbury—Heytesbury House.

Building Intelligence.

BELFAST.—On Saturday week the foundation stone of a new Presbyterian church at Belfast was laid. The style chosen is Romanesque, and the materials, Serabo sandstone for the external walling, with granite columns and Dumfries stone dressings. The cost of the church will be about £10,000. The contractor is Mr. W. M'Cammond, Antrim-road, Belfast, and the works are being carried out from the plans and under the superintendence of the architects, Messrs. Young and Mackenzie, Belfast.

CAMBRIDGE.—Some of the colleges at Cambridge are undergoing extensive alterations. The works at Pembroke, one of the oldest in the town, are nearly brought to a conclusion, very little remains of the college as it was. A new master's lodge and dining-hall have been erected, and a fine library is in course of construction, and will, it is believed, be completed by the October term. The Society of King's is about to add to its fine buildings in a manner that will considerably enlarge the college. At Trinity, near to Gerrard Hostle-lane, new sets of rooms are being built, and at Christ's College a new dining-hall. Great improvements have been made at Downing, Magdalene, and St. Catherine's Colleges.

CLAYDEN.—The parish church of Clayden was reopened on Thursday week after restoration. The former unsightly and unarchitectural church has been entirely removed, with the exception of the western tower and the chancel. The tower, which stands west of the nave, is constructed in the style of the 15th century. It is two stages in height, with embattled parapets. The tower has been opened. The organ gallery in the tower has been removed. The gallery, which ran along the west and south sides of the body of the old church has shared the same fate. The arch between the chancel and nave has been restored, and the new church now consists of tower, nave, north and south aisles, chancel, organ chamber on the north side of the chancel, and a similar one on opposite side of the chancel. The floor of the chancel is laid with Minton and Hollins' tiles; that of the nave and aisles is covered with the Poole Architectural Pottery Company's tiles. Mr. Ewan Christian was the architect, and the contractor, Mr. A. Sheasby, of Leamington.

HARROGATE.—The foundation stone of a new Baptist church was laid at Harrogate last week. Mr. W. Peachey, of York, is the architect. The style adopted is Gothic of the Early Decorated period. The church will consist of nave, aisles, and transepts, with a narthex to protect the entrances, and a tower and a spire at the south-west corner of 100ft. in height. The church will seat on the ground floor about 500. At the north end of the church will be a school-room, class-rooms, and vestries. The whole will be built of stone, lined with brick. The door and window dressings will be in local stone, and the walling of pitched-faced Pateley Bridge sets. The total cost is estimated at about £8,000, exclusive of the site.

LODGE.—The foundation stone of a new church was laid at Lodge, on Thursday week. The building, according to the plans of the architect, Mr. Kennedy, of Bangor, will be of the Early Decorated style, and consist of a nave, chancel, north porch, and robing-room, surmounted with a bell-turret at the west end. The internal fittings are to be of pitch pine, varnished, and the roof of similar wood, stained. The exterior will be built of dressings of freestone, and the roof covered with slates. When completed the building will accommodate upwards of 250 people. The total cost of the church will be £2,100.

WARRINGTON.—The new Roman Catholic Church of St. Mary, at Warrington, was opened on Thursday week. Messrs. C. and P. Pugin, of Ramsgate, are the architects. The church is in the Early Decorated style. It is of cruciform shape, and consists of nave, aisles, chancel, transept, and gallery. It is 145ft. in length by 54ft. in width, the materials employed in its erection being Yorkshire stone, Pierpoint, and dressings of Runcorn stone,

which material is principally used in the interior also. The sanctuary is 32ft. by 30. The expense of the spire will be an additional £2,000, and already the building has cost some £11,000 or £12,000. The builder is Mr. Hugh Yates, of Everton-crescent, Liverpool.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published September 7 contains articles on The Influences of Local Conditions on Public Health, The Bournemouth Outfall, The Air of Glasgow, The Health of Plymouth, The Storage of Water, Boring for Water at Stafford, The Incubation and Duration of Infection, Stimulants of Savages, A Manual of Domestic Medicine, The Sewage of the Thames Valley, A County Medical Club, Malt Syrup and the Manufacture of Beer, Public Health Reports, Local Intelligence, Water Supply and Sanitary Matters, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c. Price 2d. Annual Subscription, post-free, eleven shillings. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces. Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—H. Lindley.—S. and H.—H. and B.—M. D.—J. J. W.—J. C.—E. H.—J. and E. G.—L. and N.W. Ry. Co.—J. B.—J. M.—H. and G.—E. S.

A SUFFERER. (We quite believe what you say, but if we were to print the names and addresses of all the pretenders, as you suggest, we should have to add a four-page supplement every week to our pages.)—G. H. BRETTEL. (Can only appear as an advt.)—L. A. S. H. (Write to Lockwood and Co., 7, Stationers' Hall-court.)—A SUBSCRIBER. (Yes, unless there was an agreement to the contrary.)—STUDENT. (The mark you ask about indicates that the boundary or piece is straight: it is often used in the field-book.)

Correspondence.

CYMMER AND VALLE CRUCIS.

To the Editor of the BUILDING NEWS.

SIR,—I am exceedingly glad that the Association have included in their progress visits to Cymmer and Basingwerk, for both are in a lamentable state of neglect. Strata Florida and Neath, alas! are in no better case, and a powerful remonstrance on their part, headed by "Sir Watkin," and supported by the Bardic and Archaeological Congresses of Wales, may lead to timely and immediate measures for the preservation of the little that remains, and the excavation of the soil in the buried portions of the ruin. Of Basingwerk I have already written in your columns.

Cymmer, with its long coterminous north aisle and rudimentary arcading in three bays (now occupied as a granary, &c.), must have had the appearance of a double church: an amorphous plan, which had its parallel in a Scottish minster. The western tower (with traces of a newel staircase, either corresponding to one in the south-west angle of Valle Crucis or else leading to the upper story of the western range of claustral buildings) bears a humble likeness to its fellow at Furness. But

the remarkable point is, that Cymmer could never have been cruciform, although the original plan may have been abandoned for want of funds, as all churches were begun at the east end, the transept being never built whilst the church was continued westward. There are traces of three archways on the south front of the detached building to the west, and of ancient masonry in a stable on the north-east, which may mark the infirmary.

The departures from the strict Cistercian plan are not so very uncommon. The chapter-house at Cleeve is an aisleless oblong; at Margam, polygonal; Croxden had (perhaps) a chevet; Beaulieu was apsidal; Abbey Dore and Fountains have a transverse eastern aisle; Kirkstall had a central; its sister, near Ripon, a transeptal tower; whilst Melrose has an outer range of nave chapels. Some of the small Devonian abbeys may be well compared with Cymmer.

After I was at Llangollen in 1873, at the desire of the excellent vicar I published in his local magazine an account of Valle Crucis, which, with many subsequent annotations, is now among the additional MSS. in the British Museum. The ground plan was separately produced as a woodcut in Black's "Guide to North Wales." In it may be seen the similarity in the position of the Daystairs to that of Cleeve; but on the opposite side of the chapter-house is a small cell, quite unique as far as my experience goes. My impression is that it was the carol of the Scriba Capituli, and also used for conference, *submissa* voice, in chapter time. The curious oblique door in the dormitory of Cleeve I suggested was used by the sacristan, as the chancel wall passage was at Valle Crucis; the oriel in the aisle of Worcester; the gallery at Lichfield; and the watching-chamber in the transept of St. Alban's, for the supervision of lights. I am inclined to believe that it had a further use—as a means of communication over the vaulting of the southern transept chapels with the belfry.

Whilst preparing a forthcoming memoir on Buildwas Abbey, which will form a portion of a work on the four minsters round the Wrekin, I detected a remarkable similarity between the Salopian and the Welsh transept. The position of the claustral buildings is reversed; but in the eastern angle of the transept, in both instances, there is a staircase near a doorway. The latter was the entrance of the lay-folk on the side away from the cloister garth. The former was used by the sacristan, who occasionally slept in a corner of the church, and thus was enabled at once to proceed by an intramural passage to the central tower, in order to ring the bell for matins. The Porta excubitorum is still left adjoining the transept at Benedictine, Rochester; and at Lincoln (a secular church) the tradition of the watchers' chamber (slept in by those who searched the minster at night for fear of fire, and rang the matin mass bells), also near a transept, lingered on to the time of Browne Willis.

The presence of fireplaces over and above that of the calefactory or common-house is another instance of decadence in the observance of the ancient rule; and in the fifteenth century a Canon of Council forbade their continuance in Cistercian dormitories on the Continent. The abbot's cell was probably at the south end of the dormitory of Valle Crucis. Only in very large abbeys there was a separate house for the use of the superior.

Mr. Loftus Brock is in thorough sympathy with his subject, and his extended paper will be doubtless full of new interest. I may mention that the last Abbot of Cymmer, Lewis Thomas, was Suffragan Bishop of Shrewsbury.—I am, &c., MACKENZIE E. C. WALCOTT.

SHORES.

SIR,—“E. W. T.” surprised me by the intimation that, under the name of shores, I had really been treating of lean-to roofs! He goes curiously aside to introduce “Tredgold's Carpentry,” though the book is absolutely silent upon shores. Tredgold has been dead these fifty years, but had he lived he would in all probability have discussed the subject, not only in a far more able way than I can hope to do, but without creating “a much more complicated problem.”

Unless people see a thing in the same light

their reasoning will lead to different conclusions, and I am sorry not to coincide with "E. W. T." My definition and figure can be referred to, and the sloping timber was hardly to be taken as the alpha and omega of a shore, but rather to indicate the forces it exerts. A ladder with a man upon it would have done better, because its effect would vary with each change of the man's position, but every one can recognise the pressure against the wall, the effort to sink into the earth, and the tendency to slide upon the surface. Let there be one man at the middle, or one at each end, or a file of men uniformly loading the whole length, and still that important mechanical point, the centre of gravity, will be equidistant from the ends. But, according to "E. W. T.," more is expected from a shore than the weighted ladder or the flying buttress could accomplish, and that not merely in degree, but in principle. "It has," he says, to assist in supporting the weight of the upper portion of the wall as well as to prevent the wall itself from falling outwards. . . . It is for this reason that the two ends of the raking shore are tightly wedged up, so that its full strength as a 'post' may be utilised." Now, the utility of the raking shore for vertical support is manifestly small, and practically disregarded, except as conducing to the horizontal pressure properly opposed to an inclining wall. Shores are commonly pitched so high that leverage from the base of the wall seems a leading idea of the operator, and the portion above is so inconsiderable as barely to give the necessary resistance to an upward sliding of the shore. Friction comes into use, and the stud is chiefly intended to increase friction. Action and reaction being equal, the force at the base must have its counterpart at the crown. The stress at the ends, and throughout the length of the shore, is uniform, and the centre of gravity is therefore at the half-way point, as shown in the diagram, Fig. 4, p. 189.—I am, &c., T. M.

SANITARY DWELLINGS.

SIR,—Just now when so much has been said and written on the subject of sanitation, it may not be inappropriate to draw your attention to the buildings now erected adjoining Goldsmith's House, Peckham, formerly the residence of the poet.

I yesterday inspected the three handsome blocks of buildings known as "Goldsmith's Residences," erected by the Sanitary Dwellings Company, Limited. It consists of something like 40 sets of superior artisans' dwellings, constructed on the flat system, with the best principles of sanitation.

The sets consist of parlour, scullery, kitchen, with oven, and two good bedrooms, water laid on, and a separate w.c. to each set. These sets of chambers would be in great request, and fetch fancy rentals in the Temple or any of our Inns-of-Court, but here they are let at the moderate rental of from 5s. to 6s. each. The passage contains shafts to empty and sweep dust into, and the ventilating arrangements deserve more notice than can conveniently be given here. The usual objection to these associated dwellings is, that they present too much of the charitable institution appearance and style about them to be acceptable to the class they are intended to benefit; but that element is quite absent here. The better class mechanic and the City clerk will find in these residences the privacy and independence of a set of chambers, at the small rent I have indicated.

The attention of the Legislature will shortly be drawn to this subject. In the meantime, if the public will visit the buildings every information and explanation will be afforded there. Orders to view can be obtained upon application to the secretary, Mr. Walter West, 29, New Bridge-street, E.C.—I am, &c.,

THOMAS YEO.

GOVERNMENT OFFICES.

SIR,—I observe that one of your professional contemporaries is exercised in its mind as to the concentration of the Government offices, and has published a proposed plan with many comments. The gathering together of Government offices is no doubt highly desirable, but it

is by no means essential that the bulk of them should be under one roof. Why, for instance, should the Colonial Office open into the Duchy of Lancaster Office, or the War Office have a covered way into Queen Anne's Bounty? Instead of pulling down blocks of the most costly house property about Parliament-street and Whitehall, let me make the suggestion that a block of offices could be erected at a vast saving of expense on the ground already vacant in Northumberland-avenue, or in Victoria-street, or both. It would be a further advantage to have these howling wildernesses, which are eyesores to London, covered with handsome and monumental buildings.—I am, &c., ESTATE AGENT.

FORCE OF WIND.

SIR,—The writer of the article on "The Force of Wind," in the BUILDING NEWS of the 31st ult., in giving the pressure on sloping roofs, which he has based on theory, appears to have overlooked the experiments of Hutton—the results of which have been carefully worked out by Professor Unwin in his excellent work "On Roofs and Bridges." There is also a capital article on the same subject, with tables for roofs of all slopes from 0° to 90°, in the last edition of Hurst's Handbook.—I am, &c., J. S.

Intercommunication.

QUESTIONS.

[5114].—Warming Wooden Office.—What is the best means of warming a wooden office 7' 6" x 3' 6", so as to make it possible to spend an hour or two a day in it during cold weather?—CLERK OF WORKS.

[5115].—Wood for Field Gates.—Is Spanish chestnut a durable wood for outdoor purposes—such as field gates, &c.?—C. S. W.

[5116].—Measuring and Sketching.—Will any gentleman knowing places between Caen and Bayeux, St. Lo, Carentan, and Cherbourg, containing buildings worthy of study, kindly give me information through "Intercommunication," that I may assist a fellow-student now at Caen?—M. J. L.

[5117].—Mortar.—Will any correspondent kindly inform me if it is better to slake the lime as soon as it is brought from the kiln, and mix it immediately with sand for mortar, or to slake it, and leave same for some time exposed to the action of atmosphere, turning it all throughout occasionally, prior to its being mixed with any other material? Also whether the mortar is better from being left in a heap long before use, and beating it up when required, or used in the building as soon as mixed?—EFF TEE DOUBLE U GEE.

[5118].—Old City Churches.—I have heard that some of the old churches in London are being pulled down, and that it might be practicable to buy the material and have the churches or one of them re-built in another situation. Will any one kindly inform me from whom to obtain particulars respecting the subject—such as what churches are condemned, and who has the disposal? Is it probable that the cost of the re-building (say, 100 miles from London) would be less than if entirely new materials were purchased? Also any further information.—STAFFORDSHIRE.

REPLIES.

[5100].—Hollow Walls.—As a practical clerk of works I will give you the result of my experience, extending over a period of 30 years. The outer portion of the wall (except a single 4½ in. adjoining the openings) should be 4½ in. throughout, without any connection with the inner 9 in., and built entirely with stretchers, with a weather-point. This gives a neat, solid, and damp-resisting face to the wall, the only connection with the inner 9 in. being made with iron ties well gas-tarred and built in the bed joints. The joists may have 4½ in. or 9 in. bearing according to requirements. The idea of blue bricks resisting damp is simply ridiculous; they absorb water like a sponge. I know a building faced with blue bricks, laid English bond, and the proprietors have painted the exterior to keep out the damp. I have also observed that where headers are used, there is always a damp patch in the plaster. The advantage of English bond in hollow walls is quite equal to the "notion" of blue bricks.—JAMES THORNCLOE.

[5100].—Hollow Walls.—I should have always preferred, in my own practice, to put the 9 in. thickness outside, and the 4½ in. inside. But do not let the timbers rest on the outer thickness or they will draw in the damp, and destroy the value of the hollow. Do not bond with bricks, but with hoop iron or galvanised iron cramps placed every 5th or 6th course. These should be laid in cement. No sash or door frames should be inserted without a

lead apron or slate in cement to throw off the water that comes through the outer thickness. If this precaution is not adhered to, damp spots will appear despite the hollow wall. The main advantage of putting the 9 in. outside is that the reveals of the openings are deeper. As to the weight of floors, &c., resting on a 4½ in. wall, there is no risk if the thicknesses are well bonded together at intervals. I have carried up 3 stories on a 4½ in. inner wall; if more, two 9 in. thicknesses should be used.—G. H. G.

[5102].—Fair Wear and Tear.—If the lease contains a clause of "fair wear and tear excepted," I consider, contrary to "W. R.," that Mr. Vernon would be relieved from cutting out and rebuilding the cracked brickwork; but, practically, very few "leases" contain such a clause, though almost always inserted in "agreements."—H. P.

[5103].—Iron Bridge.—The main girders must be determined as to form and construction before any rule can be applied. The load of 2cw. per foot super will be distributed over the two or more girders the bridge is intended to have. If there are only two main girders, then the cross girders carrying the roadway will distribute the weight on both of them, and the greatest load will have to be divided by 2. When the greatest load is determined, and the depth of girder approximately fixed, the strain on either flange in centre (in case the load is central) may be found by multiplying the weight by the span, and divide product by 4 times depth of beam. This will give strain in terms of the weight. As regards the web, the shearing strain will be one-half of the load. If the load is distributed divide product by 8. Having found these strains, the sectional area of the flanges and webs, allowing for rivets, must be determined, allowing 4 tons per sq. inch in tension and compression. Dividing the tons' strain by 4 we obtain the area of flanges at centre. As regards plate girders, a proportion of span to depth of 12 to 1 is considered economical. The size of the piers can soon be determined by finding the crushing strength of the material used. They should be of brick in cement or stone.—ARCHITECTUS.

[5106].—The Largest Station.—In reply to "Alpha" in THE BUILDING NEWS, the new station at York is the largest in the world. The length of platform is to be 1,500ft., the covered portion is 800ft. in length by 234ft. in breadth; area of platform at York is 171,951ft.; St. Paneras, London, 165,360ft.—R. Q. LANE.

[5108].—Strength of Materials.—If "C. J. E." consults the questions and replies with the remarks made in the summaries of the "Architectural Science Class," he will soon understand the principles upon which the strength of materials depend. He had better not study any formula till he has gained a tolerably correct idea of the forces called into play in the breaking of a beam. Let him take a model beam, say an inch square and a foot long, and load it in the centre, and ask himself what effect the weight produces. He will perceive that two opposite forces are called into play—one the resistance of the upper part of the beam to be crushed, and the lower half to extend or tear asunder. He will perceive that at some point the effects are neutralised, and he will begin to see that the effect of the load and the resistance of the beam are two distinct forces, and have to be studied apart, and that when the beam is on the point of breaking, these two forces are in equilibrium. In this manner he will find that the strength of a beam to resist cross strain depends on its sectional area, or that it is directly as the breadth and square of the depth. Let "C. J. E." put another question which no doubt some correspondent of the BUILDING NEWS will answer.—G.

[5109].—Illuminator.—If "Papyrus" gets Owen Jones' and Digby Wyatt's works on illumination, he will find all he wants. Messrs. Audsley, I believe, have published also a work on the subject.—A CORRESPONDENT.

[5109].—Illuminator.—The best book I know of on the art of illuminating is by Henry Shaw, F.S.A., with description of pigment, initials, and processes employed by the artist at different periods, with highly-finished plates. Batsford has a copy for 16s. 6d., published at £2 2s.—R. Q. LANE.

[5110].—Separating Fine Sand from Water.—If "X. Y. Z." will proceed as follows, he will be able to keep any sand from entering his filter-bed:—

Let A be the filter-bed; B, pipe to convey the water into the filter-bed; C C, a water-tight cistern with a strong partition in the centre; D, pipe or channel bringing the water from the spring; E E, branches to turn the water alternately to the right or left

Our Office Table.

A GENERAL meeting of the Northern Architectural Association was held at Newcastle-on-Tyne, when the President, Mr. Thomas Oliver, delivered an address on "Newcastle in the Future." Mr. Oliver was afterwards, in the name of the members of the association, presented with a handsome gold watch, suitably inscribed, in appreciation of the valuable services rendered by him as honorary secretary to the association during a period of 20 years.

A TUNNEL six and four-fifths miles long—36,510 feet—is being built underground in Baltimore, for over four-fifths of the distance through hard gneiss and granite. It will be the longest tunnel in the country, and there will be only two larger in the world—the Mont Cenis, which is eight miles in length, and the St. Gothard, now in progress of construction, and which is to be nine and one-quarter miles. The tunnel is a circle of 12 feet in diameter, and extends from the Gunpowder river, about eight miles from the city, to Lake Montebello—the distributing reservoir—near the Hartford turnpike, about one mile and a-half from the city, the direction being 26° west of south. This tunnel will conduct the water from the Gunpowder river to Lake Montebello. Thence a conduit, 4,120 feet long, known as the Clifton Tunnel, from the fact that it passes under a portion of Clifton Park, conducts the water to a point just south of the Hartford road, where it enters six mains, each 4 feet in diameter, which convey the water to the city, a distance of 1,900 feet. The country along the line of the works is hilly, and the tunnel varies in depth below the surface from 67 to 353 feet. There are 15 shafts in the main tunnel, the deepest extending 294 feet below the surface. The work of the tunneling is all done by hand, it being cheaper than the machine work in a drift of such narrow diameter.

A VERY extensive plan of street improvements is occupying the attention of the Liverpool Corporation, and it is also proposed to bring the tramway system into general use in all parts of the town. Tramways have been strongly opposed by a portion of the inhabitants, who complained that the lines laid down in the streets tended to wrench off carriage wheels. Improved lines have been laid down, however, which do not involve this difficulty, and it is probable that the proposition for the extension of the tramway scheme will be carried. The borough engineer has reported that the street improvements determined upon by the Corporation will involve a net cost of £1,073,845. The acquisition of land is set down at £1,196,278, and the cost of works £137,862; but a sum of £260,295 is deducted as the estimated value of surplus land. The principal improvement is the construction of a high level road from the plateau of the Public Library in William Brown-street to Dale-street, the cost of which is estimated at more than a quarter of a million sterling.

Two large schools erected for the Pudsey School Board were opened on Monday. Both schools are in the Gothic style. One is arranged to accommodate 600 children, and the other 400 children. The cost of the Richardshaw-lane school, exclusive of the site, is £4,535, and that of the Laisterdyke school £2,952.

The foundation stone of the new Church of the Holy Rood, Crofton, Hants, was laid on Thursday week. The style will be Early English. The church will consist of nave and two side aisles, with chancel and organ chamber and vestries. It will be built of flint, with Bath stone dressings, and will cost when completed about £6,000. The contractors are Messrs. Plummer and Gamblin, Fareham; architect, Mr. Goodchild, Adelphi.

SLATES — SLATES — SLATES. — Bangor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each; 28ft., 2d. per foot; 35ft., 2d. per foot.

DEALS—BATTENS—FLOORING. — Send for price list.—R. MAY & SON, Timber and Slate Merchants, Acorn Wharf, Old Kent-road, London, S.E.

Trade News.

WAGES MOVEMENT.

LONDON.—At a meeting of labourers employed in the building trade, held on Saturday night, it was stated that of the 1,200 men thrown out of employment by the masons' strike, only twenty-four were out of work, and it was resolved that it was unnecessary to make any further collections on their behalf. A resolution was also unanimously adopted, empowering the general secretary to request the Master Builders' Association to kindly take into their consideration the claims of the labourers for an increase of 1d. an hour. This increase, the resolution stated, "is urgently needed on account of the loss sustained by them by the operation of the Education Act, which deprived them of a few shillings earned weekly by the children, and which went to supplement their small and precarious wages—a fact which is as well known to the masters as it is to the labourers by bitter experience."

MANCHESTER.—At a crowded meeting of the carpenters and joiners on strike, held on Monday evening, after considerable discussion the following resolution was adopted unanimously:—"That this meeting considers it advisable to continue the strike until our requests be complied with, as it would be an injustice to the 180 employers who have already paid the advance to make any concession whatever."

NEWTON ABBOT.—The strike between the masons and master builders of Newton Abbot, after extending over three months, has resulted in a compromise, the masons receiving 6d. per hour, and all sub-contracts to be abolished.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's purifying, cooling, and strengthening Pills are admirably adapted for all irregularities of the human body, and should be at once resorted to when the stomach is disordered, the liver deranged, the kidneys inactive, the bowels torpid, or the brain clouded. All these and greater inconveniences will yield to this medicine.

TENDERS.

ANNOVER.—For two semi-detached cottages for Hy. Dowling, Esq. :—
Beale (accepted) £160

ATHERSTONE.—Warehouse for Messrs. Bourne and Sale. Mr. William B. Tomlinson, Coventry and Nuneaton, architect :—

Norton £1,995 0 0
Fox Bros. 1,973 0 0
Spencer (accepted) 1,888 10 0

BRISTOL.—For warehouse in Fairfax-street, Bristol. Mr. H. Williams, architect; quantities supplied :—

Kidner, Bristol	£5,696
Trout, London	4,525
Kraus, Bristol	4,486
Baker and Sons, Bristol	4,380
Thompson, Bristol	4,372
Howell, Bristol	4,215
Heal, Bristol	4,100
Brock and Bruce, Bristol	3,975
Stevens and Gardner, Bristol	3,950
Bevan and Sons, Bristol	3,944
Stamp, Phillips, and Jeffries, Bristol	3,899
Stephens and Bastow, Bristol	3,894
Veals, Bristol	3,845
Davies, Bristol	3,845
Crocker, Bristol	3,508
White, Swansea	3,500

CHESTERFIELD.—For the erection of a lodging house for workmen at Chesterfield. Mr. Geo. R. Isborn, architect; quantities supplied :—

	For the buildings having 4 floors.	For the buildings having 3 floors only.
Marriott	£5,223 19 10	£4,404 2 2
Bell and Son	5,100 0 0	4,500 0 0
Wood, Geo., & Son	5,000 0 0	4,265 0 0
Bakewell, Thos.	4,850 0 0	4,107 0 0
Hodson and Paeon	4,614 0 0	3,968 0 0
Dennett, R., & Co.	4,610 0 0	3,933 0 0
Wood, John	4,570 0 0	3,890 0 0
Hind, Enoch	4,437 0 0	3,817 0 0
Clubley & Shingfellow	4,352 0 0	3,702 0 0
Stevens, Robt.	4,344 0 0	3,656 0 0
Wood, E. (accepted)	4,300 0 0	3,650 0 0

DORRING.—For offices for the Dorking Gas Company. Messrs. Fredk. Bargman and H. S. Benison, architects :—

Putney	£677 15 0
Haselgrave	667 12 0
Goddard and Sons	667 10 0
Edser	619 10 0
English	561 3 3
Hamblin Bros.	554 0 0
Lynn and Dudley	498 0 0
Shearburn	486 5 0

FOREST HILL.—For new road and sewers at Forest Hill for G. T. Congreve, Esq. Mr. E. Witts, surveyor :—

Cuxths and Ross	£1,065
Rutty	950
Woodham Bros.	840
Pearce	820
Harris (accepted)	794

hand; at F let there be a valve or shuttle, as occasion may require. The cistern should be 12ft. long, and each cell 6ft. wide, and 3ft. or 4ft. deep, the water to be admitted at the top. The sand will settle to the bottom of the cistern, and when one side is full, all he will have to do is to alter the valve or shuttle at F, and turn the water to the other side of the cistern, and throw out the sand on the other side. Each chamber should have an outlet 6in. below the outlets, B, and when the sand reaches this bottom outlet the water should be turned to the other side. Use the corner outlet to let off the water that remains on the top of the sand. I have no doubt he will find this an effectual cure, and the cost small.—AQUA.

[5112.]—House Ventilation.—A correspondent ("R. M. D.") inquires in your last issue if any one who has had experience can advise him as to ventilating the rooms of a rectory house that he is about building. The question of ventilation is a vexed one—some persons advocating the admission of cold air from the floor line, and its emission from that of the ceiling; others *vice versa*. If your correspondent wishes for an effective and economical mode of accomplishing his purpose, I would simply refer him to Messrs. Limetre and Bennett, of 107, Cannon-street, E.C., and to see for himself their plan as carried out at some of the banks, insurance offices, clubs, and numerous private offices and buildings. As an architect who has written much on this question, and dealt rather largely in it, I can safely say that rooms thus dealt with possess all that sanitary laws require.—F.R.I.B.A.

[5112.]—House Ventilation.—I should recommend "R. M. D." to construct flues, say, 4½ in. square, in the walls, through which fresh air may be brought to every floor, the inlets being about 6ft. high, or lower if the air can be warmed by being made to pass round a stove or fireplace. A simple plan is to form flues to enter a warm air chamber at the back of a fireplace. Besides these inlet flues the chimney or smoke flues should have a ventilator or Arnott's valve at the ceiling level, so that the foul air may escape. If the walls are built with a hollow there would be no need for inlet flues, as the openings at any point could be made and fitted with valves or gratings. But no ventilation is complete unless provision is made for fresh air at or near the floor level, besides a foul-air outlet into the smoke-flue or otherwise.—ARCHITECTUS.

[5113.]—Contract Plans.—By a recent decision an architect is obliged to give up the contract drawings if called upon to do so, though the custom of the profession is in favour of the architect's retention of the plans, the idea being that they are simply his instruments in carrying out his design. An architect cannot refuse to show the drawings.—ARCHITECTUS.

CHIPS.

On Saturday afternoon Cardinal Manning blessed the corner stone of St. Bridget's new Roman Catholic Schools, Mill-street, Bradford, near Manchester. The cost of the buildings will be about £2,000. Mr. J. L. Ward, of Upper Brook-street, Manchester, is the architect and builder. The warming and ventilating throughout is by means of Shillito and Shorland's Patent Manchester School Grates.

A number of workmen are engaged in laying mains in the cloisters and near the north side of St. George's Chapel, Windsor Castle, in order to provide a sufficient supply of water in case of fire. The new system has been connected with the service on the Castle Hill, which is supplied with water from Cranbourne; the hydrants will, it is understood, be erected in the cloisters and about St. George's Chapel. The upper part of the Castle has an excellent water supply, which, on more than one occasion, has proved of great service in assisting to extinguish fires in Windsor near the palace boundaries.

A new golf club-house, at Elie, N.B., was opened on Wednesday week. Mr. Currie, of Elie, was the architect, and the building, which is on the Italian style, has cost £1,000.

A new Methodist chapel was opened last week at Gosforth. The building has cost £5,000, and will seat 750 people. Mr. Oswald, of Newcastle, is the architect.

A new theatre, at Leicester, was opened last night. Mr. C. J. Phipps is the architect, and Mr. Keelett the builder, the amount of the contract being £10,825. Mr. Frank Stripling is the clerk of the works. The building accommodates 2,550 people.

On Saturday the corner stones of a new chapel, belonging to the Methodist New Connexion, were laid at Newton Heath. The style will be Gothic, from designs by Mr. Gregory Gill, architect, Staly-bridge. The cost will be £3,300.

A new Methodist chapel is about to be erected at Mullion, Cornwall. Mr. J. Hicks, of Redruth, is the architect. The building will accommodate 350 people, at a cost of £900.

In the description of Shrewsbury in our last issue, in line 29 from foot of p. 197, mention is made of the "wooden" English Bridge; it should read "narrow."

HASTINGS.—For public-house, Whitefriars-road, West-hill. Messrs. Jeffrey and Skiller, architects:—

Table with 3 columns: Item, Price, Total. Includes Parks, Vidler, Hurman, Woodall.

HASTINGS.—For house and shop in Mann-street, for Mr. John Smith. Messrs. Jeffrey and Skiller, architects:—

Table with 3 columns: Item, Price, Total. Includes Hurman, Vidler, Picknell.

HASTINGS.—For converting warehouse into stables, &c., at Cornwallis-street. Mr. W. H. Murray, architect:—

Table with 3 columns: Item, Price, Total. Includes Vidler, Eldridge.

HASTINGS.—For parsonage at Kites-nest. Mr. H. Carpenter, architect:—

Table with 3 columns: Item, Price, Total. Includes Howell and Son, Vidler, Eldridge, Coussens, Womersley, Hurman.

HATHERDEN, ANDOVER.—For sundry repairs and warming Hatherden church:—

Table with 3 columns: Item, Price, Total. Includes Beale (accepted).

KINGSWOOD.—For water supply for the parish of Kingswood, for the Dursley Rural Sanitary Authority. Mr. James Payne Curtis, C.E.:—

Table with 3 columns: Item, Price, Total. Includes Bloodworth, C., Mark, Terret Bros., Fountain and Boyd, Simmonds, A., Williams, A. G., Munro, Wm. (accepted).

LONDON.—For building new offices at 118, Bishopsgate-street, for H. Page, Esq. Mr. H. H. Collins, 61, Old Broad-street, E.C., architect; quantities supplied by Messrs. Batstone Bros.:—

Table with 3 columns: Item, Price, Total. Includes Hayward, Mark, Kirk and Randall, Brown and Robinson, Ashby Bros., Abraham, Ashby and Horner, Waldram and Co., Scrivener and White, Nightingale, Bayes Bros. and Allen, Brass, Newman and Mann, Merritt and Ashby.

LONDON.—For alterations, additions, and decorative works for H. Burkin Young, Esq., at 85, Cornwall-gate, Queen's-gate. Mr. H. H. Collins, 61, Old Broad-street, E.C., architect:—

Table with 3 columns: Item, Price, Total. Includes McIntosh, J., New window, New attic.

Table with 3 columns: Item, Price, Total. Includes Battam and Heywood, New window, New story.

Table with 3 columns: Item, Price, Total. Includes Marolda, New window, New story.

Table with 3 columns: Item, Price, Total. Includes Vernal and Griffiths, New window, New roof.

Table with 3 columns: Item, Price, Total. Includes Poole (accepted), New window, New floor.

LONDON.—For rebuilding No. 64, High Holborn. Mr. C. Herbert Shoppee, architect:—

Table with 3 columns: Item, Price, Total. Includes Drew, Lawrence, Braid and Co., Pracher and Co., Bishop, Langmead and Way, Newman and Mann, Nightingale, Axford (accepted).

LONDON.—For fittings to Ship public-house, Hackney. Mr. G. T. Holt, architect:—

Table with 3 columns: Item, Price, Total. Includes Rogers, Cocks, Steel Bros. (accepted).

LONDON.—For alterations and repairs at Trinity schools, Bow. Messrs. Lamb and Church, architects:—

Table with 3 columns: Item, Price, Total. Includes Woods, Shurmer, Steel Bros. (accepted).

LONDON.—For alterations to White Hart public-house, Cambridge-road, E. Mr. G. T. Holt, architect:—

Table with 3 columns: Item, Price, Total. Includes Steel Bros., Andrews, Huntley (accepted).

LONDON.—For the erection of shops and offices corner of London-wall and Moorgate-street, E.C. Mr. Wm. Bradbear, 23, Finsbury-circus, architect; quantities by Messrs. Lamb and Church:—

Table with 3 columns: Item, Price, Total. Includes Saby and Son, Rider and Son, Sewell and Son, Higgs and Hill, Ashby Bros., Dove Bros., Downs, W., and Co., Perry and Co., Merritt and Ashby, Newman and Mann.

LIVERPOOL.—For Primitive Methodist church and schools, Princes-road. Mr. Owens, Breck-road, architect:—

Table with 3 columns: Item, Price, Total. Includes Webster, Thornton and Sons, Ray, Hall and Owen, Urmason, Chappell, Black and Soul, Nicholson and Ayre.

NOTTING-HILL.—For the erection of five cottages. Mr. J. Randall Vining, architect:—

Table with 3 columns: Item, Price, Total. Includes Beach Bros., Thompson and Jordan (accepted), Gooding, M., [N.B.—This list appeared incorrectly last week.]

SALISBURY.—For new bank at Salisbury. Mr. H. Hall, architect; quantities supplied:—

Table with 3 columns: Item, Price, Total. Includes Krauss, Bristol, Sanders, Young, Stephens and Bastov, Bristol, Crook, Hall and Sons, Sawkins.

SHOREHAM.—For the erection of Wesleyan chapel at Shoreham, Kent. Mr. Charles Bell, architect; quantities by Mr. Henry Lovegrove:—

Table with 3 columns: Item, Price, Total. Includes Wiltshire, Willis, Thompson.

TOTTENHAM.—For alterations at the Seven Sisters Tavern, Page Green, Tottenham, for Mr. Oddy. Mr. Edward Brown, architect:—

Table with 3 columns: Item, Price, Total. Includes Marr, R., Linzell and Son (accepted), Chapman, Simmons.

TUNBRIDGE WELLS.—The directors of the Tunbridge Wells Gas Company, at their meeting on Monday evening, the 27th of last month, opened the following tenders for the erection of a retort-house, coal store, clock tower, meter-proving room, station, meter-house, photometer and experiment rooms, and other buildings, exclusive of the ironwork of the roofs of the several buildings, as designed for the company by Mr. R. P. Spice, of Parliament-street, and accepted the lowest:—

Table with 3 columns: Item, Price, Total. Includes Willicombe and Oakley, Tunbridge Wells, Trimm, R. C., Hersham, Surrey, Perigoe, J., Tunbridge Wells, Punnett, J., and Sons, Tunbridge, Potter, Henry, Stepney.

UGBOROUGH.—Tenders for building coach-house and harness-room at Kingsbridge-road Hotel, Ugborough, Devon:—

Table with 3 columns: Item, Price, Total. Includes Lethbridge, A. R., Dacket, Steer, Pellow, Crespin, Laphorn and Goad, Veal (accepted), Consins, White, Onsworth.

LONDON.—Building dwelling-house on Woodford Hall Estate for Mr. F. Lovell. Mr. E. Baxter, architect:—

Table with 3 columns: Item, Price, Total. Includes Steel Bros. (accepted).

BATH STONE OF BEST QUALITY. WESTWOOD GROUND BOX, GROUND, CORSHAM DOWN, and COMBE DOWN.

RANDELL, SAUNDERS, & CO., LIMITED.

Quarrymen and Stone Merchant. Prices, delivered at any part of the United Kingdom, furnish on application to BATH STONE OFFICE CORSHAM, WILTS. [ADVT.]

Geometrical and Encaustic Tile Pavements

In every variety. Over sixty New Designs at 5s. 6d. per yard super. "The Tiles are excellent, both in quality and colour."—BUILDING NEWS. "They are of great excellence in design—the material is not surpassed by any found in this kingdom."—Art Journal. "For paving conservatories they are the best tiles we have seen; they can be no end to their wear."—Gardener's Magazine, &c. &c. Designs and samples. Tiles free on application to WEBB'S WORCESTER TILERIES COMPANY (Limited), Worcester.

Lamplough's Pyretic Saline is refreshing,

most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL-POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world and the water, 113, Holborn Hill. [ADVT.]

SOCIAL SCIENCE CONGRESS.

ABERDEEN, September 19th to 26th. President: The EARL of ABERDEEN.—In addition to the business of the Jurisprudence and Education Departments the following Special Questions will be discussed in the H. H. Economy, and Art Sections.—What is the best mode of providing suitable accommodation for the Labouring Classes, and of utilising Open Spaces in Towns? How can the Sanitary Condition of the population engaged in the Coast Fisheries of Scotland and other parts of the United Kingdom be improved? The present state of House Accommodation in Rural Districts. Can its evils be remedied? What are the causes of the present General Depression of Trade all over the world? What are the social effects of Trade Unions, Strikes, and Lock-outs? What are the results of the Administration of the Poor Laws in Scotland as compared with those in other parts of the United Kingdom? What principles should govern the Restoration of Ancient Buildings, or their Preservation as Memorials? Are Art Competitions favourable or unfavourable to Art Progress? How can Art be best introduced into the Houses of Persons of Limited Income? Papers volunteered on other subjects will be read and discussed.—For particulars apply to the SECRETARY, 1, Adam-ct., Adelphi; or City Buildings, Aberdeen.

BUILDERS' BENEVOLENT INSTITUTION.

The THIRTIETH ANNUAL DINNER IN AID OF THE FUNDS of this Charity will be held at WILLIS'S ROOMS, King-street, St. James's, on THURSDAY, the 28th November next, WILLIAM HIGGS, Esq., President, in the Chair. Gentlemen desirous of promoting the interests of the Institution by becoming Stewards, will be pleased to forward their names to the Treasurer, GEORGE PLUCKNETT, Esq., 233 Gray's-inn-road, W.C., or to the Secretary at the Office, 4, Vernon-place, Bloomsbury-square, W.C. R. A. BRUTTON, Major-Sec.

THE BIRKBECK BUILDING SOCIETY'S ANNUAL RECEIPTS EXCEED FOUR MILLIONS.

HOW TO PURCHASE A HOUSE FOR TWO GUINEAS PER MONTH,

With Immediate Possession and no Rent to pay.—Apply at the Office of the BIRKBECK BUILDING SOCIETY, 29 & 30, Southampton-buildings, Chancery-lane.

HOW TO PURCHASE A PLOT OF LAND FOR FIVE SHILLINGS PER MONTH,

With Immediate Possession, either for Building or Gardening purposes.—Apply at the Office of the BIRKBECK FREEHOLD LAND SOCIETY, 29 and 30, Southampton-buildings, Chancery-lane.

HOW TO INVEST YOUR MONEY WITH SAFETY.

Apply at the Office of the BIRKBECK BANK, 29 & 30, Southampton-buildings, Chancery-lane. All sums under £50 repayable upon demand.

Current Accounts opened, and Interest allowed on the minimum monthly balances. Cheque-books supplied. English and Foreign Stocks and Shares purchased and sold, and Advances made thereon.

Office hours from 10 to 4; except on Saturdays, when the Bank closes at 2 o'clock. On Monday the Bank is open until 9 o'clock in the Evening.

A Pamphlet with full particulars may be had on application FRANCIS RAVENSCROFT, Manager.

STAFFORDSHIRE BLUE TERRA-METALLIC PAVING & KERBING

SUITABLE FOR FOOTPATHS, &c., &c. Now largely used.

ALSO STABLE PAVING Made in same Material to any Patterns or Designs.

The Cheapest and Most Durable Paving now in use.

JOSEPH HAMBLET WEST BROMWICH, STAFFORDSHIRE.

COPINGS FOR WALLS, STRING COURSES, BUILDING BRICKS, For RESISTING DAMP, BEARING GREAT STRENGTH, &c., &c. Made from this Material.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPT. 14, 1877.

THE STUDY OF DETAIL IN ARCHITECTURE.

WE have in one or two previous articles referred to the want of method in our architecture, and have noticed the admirable remarks of Viollet-le-Duc under this head. In his tenth lecture that far-seeing critic asks how it is our architects are destitute of invention when their studios are loaded with details and their heads are surfeited with materials? As we have observed, the present age seems to be one of accumulation, investigation, and analysis; though we are afraid the latter faculty is poorly represented. Our artists and sketchers bring home with them from their holiday tours an abundance of artistic wealth in the form of scraps and details; but few of them ever attempt to classify, compare, and arrange their materials. The same may be said of our archæologists. They search and investigate, adding to their stores of past data, but seldom or never attempt to generalise and arrange. The present age is unquestionably one of individual research and collection, but there is a sad want of method. Even in scientific research the same spirit to investigate minutely and to experimentalise is manifest. The fact is, there are fewer generalisers than detailers; the broad sketch and general outline of the true artist is neglected in the multitudinous efforts at little things, which perplex and bewilder. When the landscapist takes a view he sweeps his eye over the prospect before him, or he partly closes it, with the object of discerning the general forms and colours, and of excluding the distracting details which crowd upon his foreground. In this way only the true value of each little thing is relatively determined and sketched. Perhaps a couple of lines may be sufficient to express the meaning, where a dozen would have been ill-spent, and have rendered after all a confused impression. It is this knack of catching at a glimpse any detail, and placing it in its proper relation to the rest, that makes the true artist, as it does the discerning critic or philosopher. But somehow the architect likes to pour his admiration over some little thing that gives him present interest. Details and mouldings are copied without reference to their height, situation, importance, or lights and shadow. We look in vain through huge folios of sketches, admirably depicted, and which cost their authors days of labour, for a *motif*, or any object in bringing together the *olla podrida* they have done. The modern architect, of average knowledge, takes them and combines the details or features of two buildings, perhaps separated a distance of a few hundred miles, and designed for two totally different climates and uses. The bases of design, the material, and everything the original architects had in view are lost; but by the whim of a modern designer they are juxtaposed. What can we expect from such an idiotic proceeding than a diseased art—one, as it has been aptly said, “dying in the midst of prosperity, dying of excesses and a debilitating régime.” Would not such a procedure in nature produce sterility and disease? and can we expect any vitality from a system which so confuses the aim of art? There is no wonder our architecture abounds with hybrids. It may be said, perhaps, the discriminative architect uses his materials more judiciously; but we ask, has he a method of use? Is he adopting a principle in his selection, for if he is not he is blundering.

The eye may be a skilled guide in select-

ing forms that harmonise together, and the educated architect may depend mainly on his visual detection of suitability and adaptation; but, unless each form has passed the crucial mental test, the result cannot have the freshness of a work thought out by the artist's mind. The value of applying a vigorous principle to those forms we accept at second-hand is becoming daily more evident. The Classicists of the last century selected forms, but troubled little to understand the principle—hence the decay of their system; but let it not be said in our infatuated revivals we are repeating the mistake a second time. It is but too clear that we are. We already discern this in the two schools of “Queen Anne,” now somewhat in vogue. One is essentially a reproduction of details; the other, the resuscitation of the forms which lend themselves readily to our ideas of domesticity and picturesqueness. Our ideas, it is true, may be far-fetched—a sentimental fondness for old things; but if we conscientiously endeavour to understand the principle of the details and features we adopt, we are, at least, honestly employing them. “The more abundant the stores of our knowledge,” says Le Duc, “the more strength and rectitude of judgment is needed to enable us to make a productive use of them, and the more necessary is it to recur to rigorous principles.” As that author says, we must be true in respect of the programme, and true in respect of the constructive processes. The meaning of the former is, that the conditions and requirements of the building must be satisfied; of the latter, that the properties of the materials and the mode of combining them must be consulted. The Greeks, the Romans, and the mediævalists, each displayed these principles of action in their structures. As Viollet-le-Duc shows, the moulded forms of Roman architecture, due to the use of concrete, with which the walls and piers were filled in, were boldly rejected by the mediæval builders for forms that arose out of appliances necessary to create the active resistances required in the new structures. But we in the 19th century reproduce. If we copy honestly—that is, with discretion, knowing why such and such a form was chosen, and reproduce it for the same reason—we do well; but if we were to originate our own forms, or improve on those bequeathed to us by experience we should do better still.

Now, the same writer suggests that the principles that Descartes laid down for his own investigations should be applied to our knowledge of old work. The first was, “never to receive anything as true which was not clearly seen to be so”—in fact, to avoid prepossession. Now, if our students were to bear in mind this golden maxim, a great deal of rubbish would be discarded as useless, and many a page of unnecessary detail would never be given to the world. At present we are literally surfeited with examples—with illustrations without a meaning or aim; we cannot rise above a tradition. It has been observed more than once that the architectural profession is not addicted to study or investigation; its members are negligent in matters concerning public interest, and they are certainly not versatile readers. If they were so they would probably take a very different view of architecture. The modern training of the young architect is one that puts before him pictures instead of problems, a sketch or scrap-book rather than the methods of building or the materials he is called upon to design in. The demand for pictorial literature has been consequently incommensurate, and the public has some pretext for the oft-repeated remark that the architect can “only draw pretty pictures,” and that if we want buildings we must employ

Government officials or matter-of-fact builders. The second maxim of Descartes is to “divide each problem investigated into as many portions as possible, or as required for a complete solution.” The value of this precept instructs us in a most fundamental principle—namely, the necessity of drawing clear distinctions between features and details destined for different purposes or of general and special meaning. Architects are constantly confusing themselves in applying to some portion of a building demanding a specific mode of treatment a general rule founded on immutable laws of proportion. Thus the laws of proportion depend on certain geometrical principles which it would be ridiculous to apply generally without gross error. A certain moulding may be suited as a cornice, but not as a base member—small materials may be well adapted for an interior wall, but not for a portico or external façade in which monolithic pieces are required. Indeed, it is on the clear distinction of different functions of a building, and their reasonable treatment and definition, that the success of any work depends. How very frequently we see this rule violated in ornamentation, where perhaps a principle admirably adapted for a piece of pure ornament in one position is applied to another, the *motif* and purpose of which may be very opposite. By following this division of each problem it will be perceived that the same principle may produce very different appearances under varying conditions and materials. The third rule “is to follow a certain order in one's thoughts, beginning with the simplest objects and ascending by degrees to the knowledge of the most composite.” The value of this precept we have very often expatiated upon in these pages; it leads to a classification and arrangement of our principles and materials. Thus Viollet-le-Duc reminds us of three classes of architecture—wooden, concrete, and the architecture of jointed stones carried to perfection by the Greeks, the two last of which led to the composite system of the middle ages. The last precept of Descartes is to make complete enumerations and inquiries in every field of study, or the value of collecting the greatest possible amount of data so that we may profit by what has been done. That we have already done this in some measure may be admitted, but without classification and method such nomenclature and data are more perplexing than useful. Again, the instruction of the artists of the middle ages, that the Gothicist so admires, was precisely that propounded by Roger Bacon in his observations directed against the Aristotelian school in his time, the sum and substance of which is the necessity of experimental verification before accepting any conclusion. Do those who follow mediæval art take these principles to guide them? After all, this should be the test of their allegiance to the past. If we were to apply the above rules the whole of our architecture would be revolutionised; we should, in truth, be better followers of our ancestors than we affect to be now, for we should be entering into the spirit of their thoughts and arts, whereas at present we are only repeating their utterances, without being influenced by their aims and necessities. It is to be feared the commercial spirit has operated to check the thorough study of art, and to fill the markets with products and imitations rather than with the products of skill.

“QUEEN ANNE” OUT WEST.

FEW parts of the metropolis have more interest to the student of the Hanoverian epoch of our history than that bounded by Piccadilly on the south. Admirers of seventeenth century art and manners are wont to recal the time when

this district was more or less open; when great mansions, such as those of Burlington, Clarendon, and Devonshire Houses became the haunt of men famous in politics, literature, and art; and when Lord Burlington revived a taste for classic architecture by publishing the designs of Inigo Jones and Palladio, and by building the celebrated entrance and colonnade to his house in Piccadilly, long the home of art and artists. Pope has even acknowledged the taste of this patron of the art of the period, in the well-known line—

Who paints like Bathurst, and who builds like Boyle.

Piccadilly itself is a thoroughfare full of historic reminiscences. In 1642 the west end was entrenched to stop the advance of Charles I. and his army, and its very course is marked by buildings associated with great names in past history. Devonshire House, built in 1737, was celebrated for its fashion and literary entertainments, and as the head-quarters of the Whig party, an honour it divided with Holland House; it was designed by Kent, in the heavy Classic of his day, with a centre and two wings, and is enriched by some of the choicest works of the great masters. Bath House contains a splendid collection of the works of the Dutch and Flemish painters, and was the seat of Pulteney, Earl of Bath. Grafton House, Egremont House, Coventry House (now St. James's Club), Gloucester House, are all noteworthy buildings that have stamped the neighbourhood by their associations. During the 18th century Piccadilly was mainly composed of these large mansions, with houses of one or two stories; and even after all the changes time has effected it still retains traces of its original character as the great "coaching" thoroughfare. But our main purpose now is to trace the tide of modern architecture, and especially to note the efforts to revive the style of the 17th century that have recently been made in the neighbourhood.

Commencing on the north side from Old Bond-street, through New Bond-street, taking a westerly direction down Oxford-street, and again returning southward down Audley-street, we make a circuit of a locality in which modern "Queen Anne" has been treated by some of the leading followers of that school. Let us casually jot down the impressions these works have made upon us. At the Piccadilly end of Old Bond-street we are first struck with a new deep-red brick building of exquisite cut brickwork on the left-hand side—Messrs. Agnew's premises, called the Old Bond-street Galleries. The style seems at least admirably suited to a street which dates from the latter end of the 17th century, and which was first inhabited by the nobility and gentry. Even now it is a region of fashion, and one of the chief emporia of goldsmiths and virtuosi. No wonder, then, the architects of Messrs. Agnew's new premises—Mr. E. Salomons and Mr. R. S. Wornum—have adopted a style associated in every respect with the artistic predilections of the locality. A departure from the straight frontage has been made, the line of front being broken by a flat bay of segmental plan on one side. This is set between two pilasters of cut red brick, the lower story being occupied by a segmental pedimented porch of slight projection. The bay is corbelled from the front above the porch, between them being two circular lights, which are rather out of place. The flat windows are pleasingly united with brick architraves, and have pedimental heads at the top, formed of brickwork, the front being surmounted over cornice by a rather weak and attenuated row of balusters of wood painted. The general impression is neat, the brickwork is executed with extreme care, and the moulded and rubbed and carved portions are exceedingly well

worked; but if the front had been double the size and height, the scale of the details would have been more in consonance with the design. The fact is, the front strikes us as being small-featured, or as if its authors had given us a finely-executed miniature copy of an old building. We shall give illustrations in an early number. Passing on we note a house with a compo front bearing a tablet with the record that Nelson lived here in 1797; and we are incidentally reminded that many illustrious names are connected with Old and New Bond streets, among them being Laurence Sterne, who, according to Mr. Cunningham, died at No. 41, on the west side; Boswell had lodgings here, and his literary and other acquaintances often visited him; Sir Thomas Lawrence lived here; the Clifford-street Club held its meetings in this street, and various incidents are mentioned by Cunningham and other writers in connection with it. At the corner of Brook-street, Mr. R. W. Edis, F.S.A., has erected a very picturesque building in a style verging on Queen Anne, for Mr. George Donaldson. The design, which we illustrated in our last volume (p. 88), has some points of merit. The shop front is arched, and is pleasingly divided into one wide and two narrow bays by pilasters of red brick and stone, between which is an oak frame, that has the merit of giving large sheets for the display of objects of art, with a filling-in of painted glass in the spandrels. These pilasters are carried up the front towards Bond-street, as brick piers and figure subjects in tiles have been introduced in the pilasters. The brick mouldings are simple and effective. The upper story is hung with ornamental tiles, and forms a quaint gabled structure with a tiled roof, the meaning and value of which architecturally must be disputed, and we might indeed imagine it to be a subsequent addition. There is, at least, a lack of agreement between it and the lower part of the building, but Mr. Edis has given us a little of the architectural nonchalance or Quixotism of the school, and we suppose we must not find fault. The bay front towards Brook-street is pleasing. No. 94, New Bond-street, presents us with a contrast in the shape of a plasterer's front in a thorough gimerack style of Classic. We must not omit to notice that Mr. T. H. Watson and Mr. F. H. Collins are here building a clever adaptation of Queen Anne in the new Clifford Chambers, exhibited at the Royal Academy and illustrated this week. The oriels (iron?), the pediments, and the chimneys indicate a marked refinement of the style that is pleasing to witness. Turning into Oxford-street we are struck with a palatial pile of buildings on the north side, the premises of Marshall and Snelgrove, now being extended along the Oxford-street frontage in a florid semi-rococo style of Renaissance, with the usual pavilion roofs. We note, in passing, the very awkward arrangement of the roofing and chimneys over the circular corner. The extension is, we understand, being carried out under Mr. Hansard, architect, of Argyll-place, and will complete the block to Vere-street.

Continuing our walk westward along Oxford-street, we notice that in Queen-street, behind Mr. Blomfield's clever octagon church, St. Saviour's, is a five-storied red brick building, in connection with the school, carried out in a sensible style, with a very nicely treated gabled summit and chimney-stack, and exhibiting some good moulded brickwork in the cornice. At the top of North Audley-street, at its junction with Oxford-street, is an extensive block of shops, also in the fashionable red-brick style, though with a decided mixture of Elizabethan features. We illustrated this corner block of premises in our number for

July 13th last (page 28), and gave some particulars. Mr. J. T. Wimperis, of Sackville-street, was the architect. The executed building is of red bricks and terracotta, with which Mansfield stone has been judiciously blended in the shop-fronts. The architect has succeeded in giving a modern stamp to his building, the upper portion of which is broken by brick piers, with bay-windows at the angles—perhaps a little too cut up—the roof being relieved by a series of hipped dormers, with three large gabled dormers at the corner; the roof is curved and tiled, and at the corner a pyramidal spirelet emphasises the return; the latter feature, however, is not so successful, and has a rather crowded effect. The sandstone piers of front do not harmonise with the superstructure, and the carving to the corner entrance pilasters, with their large corbels, is coarse. The whole shop-front, in fact, looks rather poor and hackneyed, and scarcely brings down the upper treatment. The work, nevertheless, is a step in the right direction, and we should like to see a few of the dingy and commonplace premises in Oxford-street give place to buildings of similar style. There is just the fault here we are continually seeing committed—namely, a trifle too much effort is apparent. North and South Audley-streets are still rich with the remains of several old houses, dating from a century and a half ago; and in Grosvenor-square may be found examples of the genuine brick structures which graced the West-end of that period. Heavy and gloomy-looking, they are still veritable instances of massive building and grand interior arrangements. Before some of the old mansions, attached to the iron standards of the entrances, are still to be seen a remarkable relic of the era before the introduction of gas-lighting—namely, the iron link-extinguishers, which were employed when oil-lamps were used. Some of them with their standards are very interesting specimens of wrought-iron work, and we believe Grosvenor and Berkeley-squares were the last neighbourhoods which resisted the introduction of gas in our streets. In Grosvenor-square, that focus of fashion and hospitality, lived Beckford, the author of "Vathek," and the builder of Fonthill Abbey; many of the Ministers of George III. and IV. resided in and frequented the square, and for a long time it was a rendezvous of politicians, men of letters, and artists. The Earl of Harrowby resided at No. 29, and the Cato-street conspirators formed the plot—prevented on the very eve of the event—of assassinating the Cabinet Ministers of George IV., who had arranged to dine at that mansion. At the corner of Grosvenor-street is to be seen one of those genuine old houses of the "Queen Anne" style of which London has few left. It is surmounted by a massive and enriched cornice, and the first-floor windows are crowned by the characteristic cushion-friezed pediments, curved and triangular, while one sees the old-fashioned bold architraves of the cyma-reversa sort round all the windows. On the north side is another mansion with Ionic pilasters. But let us resume our notes of modern work. In South Audley-street are the well-known art-façade galleries of T. Goode and Co., the new premises were illustrated by us Vol. XXX., p. 466—the architects being Messrs. Ernest George and Peto. The building of red brick is a corner block, and is marked by three bold gables, in a style having mixed features of Flemish and Queen Anne. The gables and fronts are boldly treated, being divided into vertical panels by pilasters of brick. The circular corbel balconies are novel features, and the carved brick tympana of gables and the frieze panels are boldly executed. The chimney treatment on the return front

is piquant, though we hardly admire the general ensemble or groning of the masses at the corner, and the corner gable and roofing do not please us. The earving is the work of Mr. Harry Hems, of Exeter. We published details of this building in our 30th Vol. One point in the work as executed is the light pointing to the brick-work, which is finished with a wide struck joint. Unlike the work in Bond-street there is no gauged work; the result is that the brickwork has a lighter and rather coarse look, which, however, will get toned down in a few months. We are not sure whether this plan is not the best. We certainly think, however, the ebonised woodwork and granite shafts of the ground-floor are not at all in keeping with the superstructure—they appear the work of another taste and age. In Audley-square may be noticed a corner house, its flank facing the square, in a red-brick semi-Elizabethan style, with florid embellishments in brick, as the festoons in the gable. The loggia over the side porch is a noticeable feature. We believe Mr. T. H. Wyatt is the architect. South Audley-street has still some old gloomy brick fronts, and we might pass them by, never thinking that in Curzon House, now being bedecked with Renaissance insertions, in the shape of window-architraves, Queen Caroline, when she arrived from the Continent, before her ill-starred marriage with George IV., took up her residence; nor that the Duke of York and Earl Howe lived here. Another heavy house, at the corner of South-street, is attributed to Inigo Jones, and displays all the characteristic features of Queen Anne—massive cornices and window-sashes, small panes, &c. The most interesting object is a large, square, dingy white-brick house, with stone quoins and pedimental windows, crowned by a massive stone block cornice of the veritable 17th-century type, standing between South Audley and Curzon-streets, in that fashionable, though somewhat undefined, quarter known as "Mayfair." It is Chesterfield House, designed by Isaac Ware, the author of the "Treatise on Vaults," for the fourth Earl of Chesterfield. This stately mansion is still seen, with its green-slated roof, as if toned by time, surrounded by walls and gates. Its interior contains a grand double marble staircase and hall of two orders, a spacious library and music salon, some sumptuous mantel-pieces, and was once filled with choice works of art. The colonnade and garden front were choice of the kind; the former it is said, and the marble staircase, came from Canons, near Edgware, the residence of the Duke of Chandos. We have here at least one of the few remaining princely mansions of the last century. On the garden side, leading out of Curzon-street, a row of mansions, stone-fronted in a Renaissance dress, has been built, Mr. Wimperis being the architect. The panelled porches are over-carved, the salient feature of the front is an octagon bay, with an open loggia over, crowned at the summit by a domed roof, with heavy zinc and metal crestings. Three reception-rooms are provided on the ground floor of each of these mansions. In Curzon-street are to be seen some authentic Queen Anne and one or two new buildings in the style, besides Curzon Chapel, celebrated in the days of the first Georges for clandestine marriages, in which Keith defied the authority of Church and State. It is a heavy classic structure, and somewhat betrays the secret character of its original use. Passing these reminiscences of the morals and fashion of "Mayfair," we glance at Berkeley-square, another illustrious locality, built in 1698. Here are to be seen the works of Robert Adam and some choice bits of Queen Anne, the old iron link-extinguishers, and other remnants of the Regency. The

residence of the Earl of Powis has a stone front, its old iron railing and extinguishers still flanking the doorway. Near Manchester-square new houses are being built in the fashionable styles of the day, and we see works of T. H. Wyatt, R. W. Edis, Mr. Hesketh, and Messrs. John Norton and Masey. In Mandeville-place the latter gentlemen have designed a whole row of red brick mansions, relieved by stone dressings in a Renaissance style. Looking at them as we pass we are constrained to confess the repetition, inseparable from rows built by the mile, has given a rather flimsy look to the detail—the porches, dormers, parapets, and pavilion roofs lacking solidity of character. We find the smallest contain four reception-rooms and fifteen bed and dressing-rooms, and that the rents range from £375 upwards. The range forms a conspicuous frontage to this street.

THE MECHANICS OF SHORING.

THE erection of raking shores against old buildings is one of the commonest operations which have to be performed in connection with the work of the builder in large towns, their use being necessary, in order to prevent the walls from bulging and ultimately overturning, during the execution of certain works either upon the walls themselves, or on those of an adjacent building. A shore must, therefore, be of such strength, and so firmly fixed as to be able to counteract any force that would tend to overturn the wall against which it is placed; although it may seldom happen that its full power of resistance is brought into requisition. The shoring-up of buildings is usually left to the discretion of an experienced carpenter, but it is advisable that the architect should be acquainted with the mechanical principles involved in the construction of shores, and the nature of the forces which are brought into play.

We will suppose CB (Fig. 1) to represent the section of a wall that requires to be supported by the raking shore, AB, resting on the ground at A; AC being the ground line. Let there be a horizontal force, T, near the top of the wall at d, tending to overturn it about its bottom edge, C; the moment of this force, which measures its tendency to overturn the wall is—

$$T \times C d.$$

This is resisted by the weight of the wall (W) acting vertically at its centre, and having a moment about C of

$$W \times C e,$$

where Ce is generally half the thickness (t) of the wall. When these forces just

balance, the wall will be about to fall over, and the two moments will be equal; therefore—

$$T \times C d = W \times C e.$$

Now, in order to restore the wall to its original condition before the force T acted upon it, we must find some means of completely balancing this force, and this can be done by placing the shore, AB, against the wall at B, where it is firmly fixed against a plank or *walling piece* by means of a *needle* driven through both the plank and the wall; then by wedging up the base, A, a horizontal pressure, Q, is produced against the wall, such that the moment of Q about C balances that of T, or

$$Q \times B C = T \times C d = W \times C e$$

$$\therefore Q = \frac{W \times t}{2 B c} \dots \dots \dots (I)$$

In this formula, BC and t should be expressed in feet, W and Q in cwts. If the shore presses against B with a horizontal force, Q, there must also be a reaction of the wall against the shore equal and opposite to Q, so that Q represents a horizontal pressure against the head of the shore.

In order that the raking shore may have its full effect in counteracting the outward thrust or reaction, Q, it is essential that it should be prevented from sliding upwards by having a sufficient weight of wall above B, so that when the pressure, Q, comes upon it, the head of the needle may be kept immovable by means of the superincumbent load. If, therefore, the top of the shore is put very high up against the wall, it will be of little service in preventing it from being overturned. Let P be the vertical pressure necessary to resist a horizontal thrust outwards, equal to Q at B, and w the weight of the shore itself, acting at its centre, g. Then the sum of the moments of P and w, about A, the base of the shore, must balance the moment of Q about that point; therefore, we have—

$$Q \times A q = P \times A C + w \frac{A C}{2}$$

Bq being a horizontal line meeting a vertical from A at q. This equation may be put into the form—

$$Q \sin. \theta = (P + \frac{w}{2}) \cos. \theta.$$

θ being the angle, BAC, which the shore makes with the horizontal; and from this we obtain—

$$P = Q \tan. \theta - \frac{w}{2} \dots \dots \dots (II.)$$

So that when Q and w are known, and also the angle of inclination of the shore, we can find from this equation what vertical pressure, P, must be brought to bear on the head of the shore, in order to keep it in its place when the force, Q, tends to thrust it out. If the value of P is known beforehand, we can also find what amount of horizontal force (Q) it will be able to counteract; for

$$Q = \frac{2 P + w}{2 \tan. \theta} \dots \dots \dots (III.)$$

The horizontal and vertical forces at B being thus determined, we can find the compression (F) down the shore by resolving P and Q, in the direction of AB, and adding their resolved parts together; therefore, we have—

$$F = P \sin. \theta + Q \cos. \theta \dots \dots \dots (IV.)$$

In order to find whether the shore is strong enough to resist this compression, we must use the formula for a long pillar—namely,

$$L = a \times \frac{d^4}{l^2}.$$

Where a = 15.5 for fir, d is the diameter or width in inches, and l the length in feet; L being the safe load in cwt. that may be put on the pillar. As, however, the depth of a shore is usually double its width, we shall get twice the resistance, as obtained by the above formula, or F should not exceed—

ECONOMY OF MATERIAL IN BRIDGES—METHOD OF DETERMINING HEIGHTS OF TRUSS GIRDERS.

A paper read at the annual American Convention of Civil Engineers by Mr. Charles E. Emery, M.E., on the "Relative Quantities of Material in Bridges," calls for notice by its suggestive character. The author has investigated the proportions for every kind of girder bridge, with the object of ascertaining the best examples of each type so as to compare them with each other. It is clear that if we increase the height of a girder we decrease the moments of strain and also the chord strains and sections; but on the other hand we lengthen the web members or diagonals. This being so, Mr. Emery found it necessary to arrive at a proportion, or proper height, for each type of girder, to secure the minimum amount of material. To secure economy of material the angle of 45° has been regarded as the best for a diagonal in all cases, but other writers have shown that some modification of the angle should take place when circumstances vary. In Professor De Volson Wood's work on "Bridges and Roofs" it is shown that the vertical angle of the diagonals should decrease with the number of panels. Mr. C. Bender, in a paper on the application of the theory of continuous girders in bridge-building, recognised the fact that continuous girders need not be as high as ordinary girders; that for an ordinary girder of 200ft. span 27ft. is the assumed height, while for a continuous one 25ft. would do. Mr. Emery has followed this line of reasoning apparently, and has developed a method in which the weight of any girder "is expressed by an equation of which the minimum value may be obtained by a simple original method, and thereby the proper height of the girder and angle of diagonals be determined to secure the minimum weight or cost of material." This method is applicable to any system of loading, and takes account of the increased sections necessary for material in compression. The difference in cost per lb. of compression and tension material, and the comparative costs of different materials which may be necessitated in certain parts may be found, "when the height will be ascertained at which the relative amounts of the several kinds of material used will be so proportioned as to secure the minimum cost." We may endeavour here to explain the process the author adopts without the help of diagrams. The general result, the author says, appears to be "that the height of all forms of bridge, except the continuous girder, may be materially increased—as compared with ordinary practice—with a saving of material, even when provision is made to secure the stability of the longer struts, and counteract the effect of wind pressure. In fact, the ordinary heights of some forms of girder may be nearly or quite doubled without loss." Now, the plan developed by the author has no novelty about it; it is founded on the properties of the triangle, or the graphical method of representing strains by lines at right-angles to the direction of the members—a system that has been found of service in considering fluid pressures, and one that has often been explained in these pages. If we conceive a system of strains in a diagonal framed girder to be represented by lines at right angles to the members, a polygon is formed, the sides of which become equal, and are normal to, the real forces. The advantage of the lines being normal to the several forces is that the strain diagram so formed does not confuse the drawing of the bridge or truss. Let us suppose a right-angled triangle, the hypotenuse representing the diagonal

member of a bridge with a horizontal projection equal to the base, and a vertical projection equal to the perpendicular of the said triangle. Then we may represent the load acting vertically at either end of the diagonal by a horizontal line equal to the base, and the strain parallel to the diagonal by a line drawn at right angles to the hypotenuse, and having the same horizontal projection. The shearing strain through a vertical member can be represented by the horizontal line just drawn, while the thrust or strain of a horizontal member can be expressed by a vertical line, and the three lines thus drawn form a triangle of strains. Thus the first triangle may be regarded as the diagram of lengths, and the last the strain diagram, and, by multiplying the length of any member in the first diagram by the corresponding length or line in the strain diagram, an expression is obtained proportioned to the volume of the member from which the volume, weight, or cost may be arrived at by the use of a proper coefficient. Doubling these diagrams, which make a large triangle, about the perpendicular forms a rectangle, the sides of which are respectively equal to the longest sides of the two triangles. Now, calling the coefficient s , we have volume of the diagonal, or D equal $s(Dd)$ (d representing the corresponding line in strain diagram) equal s times area of rectangle. As the triangle = half the rectangle, and is = to half the product of D by d , hence the volume of D = the product of the coefficient into the base or horizontal projection multiplied by the perpendiculars of the two triangles or the diagonal of rectangle. Again, the volume of a vertical member is represented by the coefficient (s) multiplied into the horizontal and vertical projections of the length diagram; and similarly the volume of a horizontal member is the horizontal projection multiplied into the vertical of the strain triangle and by coefficient. The joint volumes of the vertical and horizontal members are thus equal to the sum of these two products. Thus the volumes of any number of diagonals having the same angle may be combined by providing the different terms of the perpendiculars with the coefficients representing the strains on each in terms of the weight, and summing them together. Thus the diagonal, vertical, and horizontal, subjected to strains necessary to hold a load in equilibrio, may be summed with other members under different strains, and the expressions for diagonals of different inclinations and those for horizontal and vertical members may be summed together by varying the coefficients of the corresponding rectangles. The volumes of diagonals, again, at any angle, and of the vertical and horizontal members, may be expressed in terms of the segments of the diagonal of the rectangle multiplied by a constant. Hence, as all the members of a girder must partake of one line or other of a triangle, and as the strains are dependent on the angles, it is evident that the volume of all the members of any type of girder may be expressed in one general form of equation, or $V = sW(mH + mt)$, in which m = the sign of summation of the coefficients H and t , or the segments or factors of the rectangle. The author next proceeds to show how the value of the coefficient s , or strain unit, may be found. It is shown that s , for a wrought-iron member under a strain of 10,000lb. per square inch of section equals the weight of wrought iron 1ft. long, with a section of one ten-thousandth of an inch, or 0.000,337,44lb. The result of this system shows that the best angle of diagonals and height of girder to secure economy in material varies with the length of bridge, the number of panels, the horizontal stretch of diagonals, &c., and very materially with the relative strains

put upon horizontal and vertical members in compression. Thus, in long truss bridges the preponderance of weights in the chords requires for economy that the vertical angles be less than 45° .

Let us take a few of the results of this system given in a tabulated form in Mr. Emery's paper. The first example given is a rudimentary arch of two beams or rafters, loaded at apex, with feet supported by the earth. Here the height for economy—considering that the thrust is met without cost by the earth—is equal to the panel length, or 1.000, and the proper angle of diagonal is 45° . When an iron instead of the earth chord is considered the economical height is increased. The table gives the height as 1.225 times the panel length, and $39^\circ 14'$ for the vertical angles. If a king-post be added the vertical angle returns to 45° . When, as in the case of a partition with floor beams, the chord is not regarded the economical height may be reduced to .58 of the panel length, the vertical angle of diagonals being from 50° to 60° . If we take the examples of long girders with one-panel lengths, the triangular systems of bracing require less height and weight than the quadrangular girders of three panels, as a queen-post roof, upright or suspended, has an economical height of from 1.157 to 1.055, the vertical angle and diagonals being from 40° to 43° . In four-panel girders—as the king and queen post truss—the proper height is put at 1.885 times the panel length; the Fink, or suspended beam, 1.700; in the quadrangular four-panel the height is reduced to .878, and in the triangular four-panel it is 1.013, the vertical angle of diagonals being only $26^\circ 16'$. The weight of material in the triangular form is thus less than in the quadrangular form with inclined ends, and the latter is more economical than the Fink triangular type. We notice also that the quadrangular four-panel truss is far more economical in height than when the upright end-posts are omitted—in the former the angle of diagonals is $48^\circ 42'$, in the latter it is $41^\circ 23'$. These conclusions are based on strains in tension of 10,000lb. per square inch, and in compression for posts and diagonals 0.5, and for chords 0.8 the above. We consider Mr. Emery's method to be a very important one, as the value of scientific trussing resides in the saving of material and the reduced height of the truss, and not in the apportionment of the sectional members to meet a particular load.

NORMAN CASTLES AND NORMAN WORKMEN.

SO much and such earnest attention has now during so many years been devoted to the care and history of the churches of the Middle Ages, scattered here and everywhere over the country, that it would seem not a little strange that some more note has not been taken of the castles, the ruins of which are yet to be found over the face of England. We have no hesitation in affirming that they are not inferior in art-interest to the churches and even cathedrals themselves. And they have at this time a yet more enduring and special interest attached to them from the fact of many of them yet remaining, in part at least, in pretty much the same state as that in which they were left by their first founders and builders. Everything is now all about us so rapidly and entirely changing, and the old and antique is giving place so fast to the new and improved that it is hourly becoming more important to note the existence of that which is left to us of the work of those who have gone before, and who have, indeed, in no small degree taught us what to do. In mechanism, and in mechanical ways of doing work, we no doubt

leave our ancestors far enough behind us, but in art they are yet our teachers.

We have been more than struck with this by a hasty visit to Dover Castle, and by a somewhat close—as far as is, indeed, possible—study and examination of its design and mode of construction, and by the high-art faculty, not usually attributed to Norman work, displayed in it. The history and architecture of Dover Castle, and the fine-art capacities of its Norman builders, who once on a time held such potent sway in England, will be found significant of much. We need not, for our present purpose, say much of the history of this famous stronghold, from its first beginnings in the days of the antique British king who first laid its foundations, or, rather, built on its site. All this has probably long vanished, and the *pharos*, or watch-tower, or lighthouse—the actual ruined remains of which still stand by the chapel, and are to be seen so conspicuously from almost every point of view—is probably, and with little doubt, the oldest building yet remaining on the spot on which this Norman stronghold stands. It is supposed, so say the authorities, to have been erected during the lieutenantcy of Aulus Plantius and Ostorius Scapula, of Roman times and occupancy.

The next work—for we must needs give a short note of what was, in order of time, done, to make more clear to apprehension what is left and the state it is now in—was that of the Saxons, who are said to have extended the work of the Romans, and to have built more lengthened walls and many additional gates and towers—*e.g.*, Godwin's Tower, Cotton Gate and Tower, Clinton and Valance Towers, all on the exterior of the Roman fosse; Harcourt Tower, Well Tower and Gate, the Armourer's Tower, and King Arthur's, or the North Gate. All these (and it is necessary to note them) have been destroyed. There would also seem to have been other towers and gates, built before the Norman occupation of the place, and the authorities we have looked into differ not a little among themselves as to which and how many of these there were, and to have mixed them up a good deal with the genuine Norman work which yet remains, and about which—changed as so much of it is to suit present requirements—there can, as we take it, be no sort of doubt. We are looking now at the actual work itself. There is an interest in the mere names, so suggestive are they, of these gates and towers, whoever first laid their foundations and built up their ponderous walls. In the inner line of walling, next to the keep, square and massive, in the centre, there are the Duke of Suffolk's Tower and Palace Gate. This gate led to the citadel, or keep, and was portcullis-guarded. Other gates are here of quite modern names. The King's Gate was strongly defended, and was doubtless reserved for special occasions. Magminot's Tower and Gore's Tower, together with their halls or chambers, are used now as store-rooms for the most part. Peverill Tower and Gate, in this inner circle of towers, led directly under a covered way to the outer line of towers and gates, all making a vast oval extending from the very edge of the precipitous cliff on which the castle stands westward to the opposite edge of it eastward, thus encircling the whole platform of buildings, with the keep in the centre of all. All were moat-surrounded, the cliff itself forming an insurmountable barrier on the south side. No more complete idea of a Norman fortification can be imagined. All is complete, and a contrast indeed to the additions to it which have been made to meet the requirements of modern warfare.

We might thus go on, and give not a few details that might be a little new to some

readers on these many and individual towers and gates, for no two of them are alike; but without a good and correct plan of the place we could hardly expect to be well understood, for the plan is most irregular and complicated. It may, however, be specially noted by those who can get access to a good plan that *Allbrensis*, or *Averanche's*, Tower, standing in an angle of the wall, is, with others near it, a specially fine example of Norman art and architecture. It was well furnished with platforms, galleries, and loopholes for the archers defending it, and had machines for pouring down hot water, burning sand, and melted lead on to the assailants beneath, so that fiery engines of destruction are not new after all.

Next comes the undoubted Norman occupation, and, we may add, the really artistic interest of the work, both as art and architecture, for all the interest here lies almost solely in the work of the Norman builders, and it is to their work, and to the state which it is now in, and to its artistic merits, that we would call a moment's attention. After the battle of Hastings William the Norman besieged and took this very castle, as it then was, whatever that might precisely have been. He put the then governor, Bertram de Ashburnham, to death, and appointed his half-brother Odo, Bishop of Bayeux, to succeed him, and thus commenced, in fact, the "Wardenship" of the Cinque Ports. The Constable of Dover, thus installed with his knights, went to work with a will, and without any doubt made of this castle what it now is—of course excepting the purely modern and to-day's barrack building, and excavating, and surroundings, and which incongruities all go to make up the immense difficulty of fully comprehending the plan and details of the original work. Indeed, it will be found that these Norman architect engineers did the whole of the work, or nearly so, as we now see it. The old materials they doubtless made liberal use of, but the designing and actual building, as much as you can get to see of it, is without a doubt theirs. And here it is that the real interest of the work, as artistic and expressional work, really lies. It is impossible, in looking, with the help of the mind's eye, and eliminating the frightful modern additions that have been made to it, at such work as this, not to see in no long time the high-art skill and faculty of the Norman builders. We write this on the spot, and feel quite convinced that, rude as the work is, and rough and rude as the stone blocks are which compose it, there was a skill and refinement of mind and art-power at work, which can hardly be excelled, and, indeed, has not been anywhere excelled. This is, of course, saying a great deal, but the proof lies visibly, if patiently looked for, before you. We can only point to a few things and items in proof of this, but the very first glance will show how artistically, instinctively, these Norman workmen went to work, and wrote on that lesson to be read even now.

We hardly know what best to note first, but no small skill was shown in the very placing of the parts of this castle and surrounding walls and towers. They are as firmly placed as a whole, and as skilfully built up out of the ground on which they stand, as the world-famous Parthenon itself, on the Athenian Acropolis, where, as is known to those who have looked closely into it, the very beauty of the building itself is to the full doubled by the position it occupies, and the consequent happy points of sight afforded from which to see it. Nothing can well be better or more artistic than the way in which this has been accomplished. The building seems to grow naturally out of the ground on which it all stands, and to meet the eye

without effort, irregular as all is. Approach this Acropolis from what point you will it is the same. We are here, of course, putting out of sight the modern barrack buildings and elevations, and, as far as may be, the lamentable distortions of the ground itself on which the castle stands, nearly the whole of which has been cut into awkward terraces and artificial slopes, and with formal cuttings every here and there for the requirements of heavy artillery. Much has, therefore, in the mind's eye, to be eliminated, and an effort made to look at the work as it originally was. When this is done, as far, indeed, as may be, we see the work of the Norman castle architect and builder, and can form some true estimate of his high-art power over the materials he found about him, and which he knew so well how to make use of.

But what most, perhaps, of all will strike the architectural student in the work here—and bearing in mind that the architecture he is looking at is Norman and quite plain and unornamented—is the fact of its refinement—refinement of line and detail, and predominating feeling. We here would refer him more especially to the workmanship in the towers in the outer line of walling, and to those specially more or less untouched, and now, as would seem, utilised as storehouses. Any one, we are at times told, can build a common upright wall, with a narrow window. Here may be seen the way to do this, but, as will be seen, it takes artistic power to do it, simple as it would seem. Like, as in the work in the Athenian Acropolis, we are a little at a loss to see which to wonder at most—the art-power of the superintending architect of the works or the executive skill and taste—for he must have had it—of the workman. It is thought in these days that the artist-workman is needful only where ornamentation begins, but here, as in the Greek work, it will be found that he is always needed, and that but little can really be done without such power in the workman, whatever the superintendence may be under which he works. A great art-lesson is most surely here to be learnt.

We had hoped, but our space fails us, to point specially to the work of the keep or citadel, remarkable in very many ways, but must wait another opportunity. It is, all ways looked at, both outside and inside, well worth attentive and lengthened examination. It is right full of poetic feeling, and might be made easily much more so.

C. B. A.

THE YORKSHIRE ARCHÆOLOGICAL ASSOCIATION.

THE eleventh annual excursion of the above society took place on the 29th ult., under the direction of Mr. Fairless Barber. Bolton Abbey and Skipton were the places visited. The party drove from Skipton to Bolton where they arrived about 1 o'clock, and were received by the rector. Mr. J. T. Micklethwaite, F.S.A., read a paper on the abbey. He said that the church of a house of canons had peculiarities which differed from those found in the churches of any of the monastic orders. One of the commonest, and at first sight most unaccountable, of these, was that the nave has only one aisle, as they found in Bolton Abbey, at Easby, at Kirkham, at Briekbourn, and at many other places. Most of these churches were buildings of considerable architectural pretensions, in which the absence of the south aisle—for it was generally the south aisle that was wanting—appeared as a great defect. But this one-aisled plan, in his opinion, came perfectly naturally, and was the legitimate consequence of the conditions under which the work was executed. If they examined the present ruins of the abbey they would find that as usual the work was begun with the choir, and worked gradually westward. The earliest part, in the lower part of the side walls of the choir—

though it was afterwards lengthened and almost wholly rebuilt—kept its aisleless form to the last. The early work there must date from about the time of the foundation. The church had not been long finished before the alterations began, as they did in nearly every other church of the same sort. The canons felt that their churches were inferior to those of the monks, and notwithstanding their length they were cramped for want of breadth. They craved for the addition of aisles, which were becoming common even in parish churches. But here they were met with a difficulty. Along one wall of the nave ran the cloister and important buildings abutted against it towards its west end. To add an aisle on that side would have been expensive and very inconvenient, and so they were content with one on the other side only, where the ground was free. Where there was no cloister, as at Ripon, two aisles were added. The aisle at Bolton was added, as the west part showed, early in the thirteenth century, a very few years after the church was finished. It had been somewhat altered in parts since, but in plan it remained the same. To compensate for the want of an aisle on the south side, the wall was taken down as far as the roof of the cloister, and the existing range of five fine windows set up in its place. In the fourteenth century the choir and transepts were magnificently rebuilt almost from the foundations, and somewhat extended. The choir, even in its present condition, is one of the most beautiful architectural compositions in England. The latest work at this church was especially interesting, because it showed, arrested half way, a process which had been applied to half the parish churches in England, and which had entirely altered their external character. When a church had a tower at its first building it was always in the centre. Whence came it then that in nine churches out of ten, as we now see them, the towers are at the west end? The greater number of parish churches were without towers at first—the little church at Adel was a typical, because unaltered, example of what most others had grown from. But in later times, and chiefly in the fourteenth and fifteenth centuries, towers became fashionable, and it was a very poor parish which was without one in the seventeenth century. These towers were built very slowly, sometimes going on for the greater part of a century. As it was important to avoid disturbing the church, as would have been done by breaking into it, especially in the middle, the new towers were built on fresh ground outside, generally at the west end. Then when the work was done the west end of the nave was taken down and the building joined on to the tower. What became of the original central tower at Bolton Abbey was not known. Perhaps its fall had caused the general rebuilding of the choir and transepts in the fourteenth century. Perhaps it was taken down at that time and not rebuilt. However that may have been, it was thought fit in the sixteenth century to build a tower at the west end, which, according to the inscription on it, was begun in 1520. At the suppression, twenty years later, it had only reached the height of the nave, and in that state it has come down to us. The thirteenth century west part is still standing, and close to it is the large arch of the tower, which, if the work had been allowed to go on a few years longer, would have opened into the nave. Of the ancient furniture of the abbey scarcely anything remains. Though the canons took the general form of their church from that of a parish church, they arranged it entirely in their own way. A parish church is all one, the nave and chancel being only different divisions of the same apartment. But the canons made it two. They wanted the choir for their own services, and so they fenced it off in a way which takes from it all ritual resemblance to the parish chancel. The choir was cut off from the nave by two solid screens, one in the eastern and one in the western arch of the central towers. The screen at the west end contains some old fragments, which no doubt at one time formed part of the inclosure of some of the chapels. There was a story that the screen at Skipton came from here, but that he thought unlikely. In the south transept were the remains of two altars, and

there is the slab of another lying in the tower. This last has a rectangular sinking in the middle, and has been taken for the "sepulchre," a place for the reception of relics which were inclosed there under the small stone, called the seal of the altar. But it was much too shallow for that use, and was probably no more than the matrix of a brass plate which had been let into the stone. Scaled altar stones were exceedingly rare. He only knew of six in England. The three panels over the Early English west door had been painted. The subject appeared to have been Our Lord seated, and with angels on either side. These are the only external mediæval pictures he had seen in England; but there are traces of painting outside the Lady Chapel at Ely. Mr. Micklethwaite then went on to refer to the domestic buildings of the Priory, of which little remains except the foundations.

Returning to Skipton the excursionists lunched at the Town Hall, and afterwards visited the castle of which Mr. Morant gave an interesting sketch. He said that at the time of the Norman Conquest Skipton was in possession of Earl Edwin, son of Leofwine, Earl of Mercia, but his lands were seized by the King and given to William de Romillé, whose descendant, Robert de Romillé, built the first castle here in the time of William II. Of this no remains can be seen except the inside of the entrance, with its groove for the portcullis, hooks for gate hinges and channel for bar, the dungeon and tower on the north side, which retains the original circular-headed openings with some remarkable grooves, the use of which it was difficult to explain. There was no doubt a keep, but of this no trace remains, unless the chamber under the large kitchen is a portion of it. The dungeon he considered very perfect. The old road leading to the original entrance is plainly to be seen winding round to the left of the present path. After tracing the line of descent from the original builder of the castle, Mr. Morant went on to say that it was probably Robert, Lord Clifford, who was born in 1305, was Sheriff of Westmoreland and Warden of the Marches of Cumberland and Westmoreland, who enlarged the castle and built the large towers or rounders, the southernmost of which is a story higher than the others. Probably these, with some apartments on the north side next the cliff, comprised the whole castle. The masonry is very massive, the outer walls being 10ft. in thickness. Lord Clifford would also have built the barbican and outer entrance, and some other buildings, remains of which still are to be seen. One of his sons, Roger, Lord Clifford, obtained a license from King Edward III. to make a park at Skipton, and to inclose there 500 acres of land. With regard to the buildings in what is known as the "Conduit Court," Mr. Morant believed that either during the time of "Black-faced Clifford," who held the castle between 1455 and 1461, or more probably in that of "The Shepherd Lord," who possessed it between 1485 and 1523, the buildings on the north and east sides were erected, and that the whole masonry now seen within the courtyard was built at that time. The "Conduit Court" is so called from the conduit which conveyed water from the Skipton Rocks, about three-fourths of a mile from the castle, terminating in this court. In 1537, the castle received another important addition, for the great hall and octagonal tower at its east end were erected. The hall remained in its original state until about 100 years ago, when it was divided into various rooms. In the winter of 1648 the castle was still further dismantled. In 1655 Anne, Countess Dowager, of Pembroke, commenced to restore the castle, and to make it habitable. As the castle was not allowed to be made capable of being fortified again, the walls were pulled down to a level line and then rebuilt. The old flat roofs were replaced with sloping ones, which would not admit of cannon being placed upon them. She also diverted the roadway, and built the new entrance in a civil style of architecture, with a chamber over it, and a bold flight of steps leading up to the gateway. She also restored the upper part of the outer entrance. The castle was then in the same state in which it now stands, except that the great gallery had

not been divided, and that the building was all in a habitable state. He believed that the roofs had been renewed since then. The party was afterwards conducted through the castle. Thence they proceeded to examine the church of Holy Trinity which adjoins it. With this the day's proceedings concluded.

PROPOSED NEW PUBLIC OFFICES, SOUTHAMPTON.

IT is proposed to erect new public offices at Southampton, and we hear there has been a strong division of opinion as to the site. The public works committee it appears have proposed the site of the old audit-house or fish-market—a position near the bottom of the High-street, and considerably out of the centre of the town; but the majority of the inhabitants, we are informed, object to spend from £12,000 to £15,000 on such an unsuitable site. A much more available and central site is to be had in the Above Bar-street, once the property of Miss Ogle, and is large enough to enable the building to be set back; but from some opposition of a self-interested kind, known only to provincial towns, the advocates of the lower site have actually had plans prepared by the borough surveyor for the accomplishment of their idea. We are told the surveyor has made plans showing the conversion of the audit-house and fish-market for the new offices. Whatever is done, let not the town council commit the absurdity of repeating the blunder they made some years ago in placing their greatest public building, the Hartley Institute, at the very bottom of the town, when far better and more desirable situations presented themselves. The Ogle property, we are told, is still in the market, and would give a site worthy of the civic offices and of the expenditure. We may just mention that Southampton, though three times the size of Winchester, and nearly double that of Wakefield, does not yet possess public offices nor a public hall worthy of the name; while the old county town has had a town hall some ten years, and Wakefield has just commenced the erection of one that will entail an expenditure of nearly £40,000. There are some towns fated to remain behind.

RAPID PLASTERING.

MR. HITCHINS, of Stoke Newington, has introduced to our notice a new method of forming ceilings and other plaster work which, for durability, saving of time, and cleanliness, is unrivalled. By means of this system the plaster is prepared beforehand in slabs, which are fixed expeditiously to the joists, forming the ceiling at once as it would be when lathed and plastered with the two coats of lime and hair in the old process. The slabs or sheets are made in the following manner:—A layer of plaster of Paris in a moist or plastic state is spread evenly on a flat surface surrounded by raised edges of the form to produce the desired bevel of the edges of the slab or sheet, and upon this first layer of plaster is laid a sheet of canvas or other woven fabric of proper size, or a thin layer of loose fibres, which is made to embed itself into and adhere to the plaster. Two laths are then laid along two opposite edges of the canvas, upon which another layer of plaster is spread evenly, and before it sets a rough broom is passed over the surface of this second layer of plaster to form a key for the finishing coat. When the plaster is set the slabs are nailed to the joists, as before mentioned, and the joints are made good with plaster of Paris. The third or finishing layer of lime and plaster is then applied to the ceiling in the ordinary way. Besides the advantages derived from rapid fixing, with the minimum of dirt and inconvenience, the new ceiling is practically uninflamable, and very economical to put up. Moreover, unlike the old plaster ceilings, it can never become detached from the joists; in fact, besides being self-supporting, it braces and strengthens all partitions and slight timbers.

St. Andrew's Church, Feniton, Devon, is being restored by Mr. Harry Hems, of Exeter, from the designs of Mr. R. Medley Fulford, architect.

SHOOTING-BOX AT BARNACRE FOR THE EARL OF BECTIVE—
TOWER OF ST. ROMAIN, ROUEN CATHEDRAL—NEW VILLA
AT BURTON-ON-TRENT—CLIFFORD CHAMBERS, BOND-
STREET—ST. MARGARET'S CHURCH, HOLLINWOOD.

OUR LITHOGRAPHIC ILLUSTRATIONS.

CLIFFORD CHAMBERS, BOND-STREET.

THIS building replaces an old and unsightly structure hitherto projecting into Bond-street. The main portion of the new building has been set back to the general line of the adjoining properties. The bay windows, shown in our illustration, have been obtained, with the consent of the Metropolitan Board of Works, in place of the old projection. The interior is arranged on the ground floor for shops, with storage in the basement. The centre doorway gives access to three sets of chambers on the upper floors, each consisting of a sitting-room, bedroom, bath-room, w.c., &c. They are entered through a separate lobby from the common staircase. These chambers are divided from the lower part of the building by fireproof structures. Accommodation for the house-keeper is provided on the top story. Messrs. T. H. Watson and F. H. Collins are joint architects; Messrs. Manley and Rogers are the builders.

ST. MARGARET'S, HOLLINWOOD.

THIS church, the designs for which were selected in open competition, will be built upon the site of an old and ugly brick building which has done duty for some 120 years, and in which accommodation was provided for about 400 worshippers. The new church will be built of stone with Yorkshire stone parpoints, tiled roofs, and yellow deal fittings, with the exception of those in the chancel, which will be of English oak. The general character of the building is plain, and any effect which it may have is due more to careful grouping than to unnecessary ornamentation. It will seat 600, and the estimated cost is about £6,000. The work in the foundations, which are now in hand, has been entrusted to Mr. Robert Wild, of Hollinwood. Mr. Freeman, of Bolton and Derby, is the architect.

BARNACRE SHOOTING-BOX, THE PROPERTY OF THE RIGHT HON. EARL BECTIVE.

THE site chosen for this building is at Brigg's Gill, in the township of Barnacre-with-Bonds, and is situate about 2½ miles from Garstang Station, on the London and North-Western Railway, and about half-way between Preston and Lancaster. The site is 300ft. above the level of the sea, and commands an extensive view of Morecambe Bay and the Fylde district of Lancashire. It is well wooded, and situated in a district abounding in game; large tracts of moorland are also near. The building is entered by a vestibule, to which is attached lavatory, &c.; from the vestibule is a passage leading to the large staircase hall, the front part of which is used as a billiard-room; the main body of staircase hall is 29ft. x 26ft. 6in., the part used for billiards being 18ft. 9in. x 15ft. additional. Adjoining the hall is Lord Bective's room, 16ft. 3in. x 15ft. 2in., with lavatory attached, and connected with this room is Lady Bective's boudoir, 17ft. x 16ft., with lavatory attached. A passage from the vestibule

to the north side communicates with the garden; a door in this passage leads into the dining-room, 22ft. 3in. x 17ft. 9in., exclusive of bay window. Another passage at right angles to the main passage leads to the kitchen, &c.; doors in this passage open into the smoke-room, 17ft. 6in. x 17ft. 6in. The east portion of the building contains the servants' rooms, consisting of a kitchen, 17ft. x 15ft. 8in., exclusive of bay window; scullery, 11ft. 9in. x 9ft. 2in.; larder, 9ft. 2in. x 6ft.; butler's pantry, 10ft. 9in. x 8ft. 9in.; pantry, 10ft. x 9ft.; housekeeper's room, 15ft. 6in. x 10ft.; servants' hall, 15ft. 6in. x 10ft. A passage leads to the outbuildings at the east end. Two pairs of back stairs are provided. The outbuildings consist of a gun-room, 14ft. 6in. x 12ft.; wash-house, 14ft. 6in. x 12ft., with boiler, &c., complete; also rooms for wood, coal, tools, lamps, and two water-closets. Large cellars are provided under dining-room, kitchen, scullery, and larder. The first floor contains ten bedrooms of large size, together with bath-room, lavatory, housemaid's closet, and two water-closets. The attic contains ten bedrooms of an average size of 14ft. x 9ft. The building is erected in the half-timbered style, with cement panels between framework, ornamented with incised floral decoration. Projecting eaves and barge boards are provided, the situation being exposed. The roofs are covered with red tiles. The upper portions of windows are glazed with ornamental lead lights of various designs. The timber for the internal fittings of hall and best rooms is of selected pitch pine. The hall is surrounded with a dado with ornamental panels; this dado runs up the staircase and around landing. The roof of hall is open-timbered, with elaborate principals panelled between. The staircase is in the Elizabethan style, with grotesque figures on the newels, each supporting a cluster of lights. It may here be mentioned that the whole of the building is illuminated by oil lamps, and is heated by steam coils throughout, together with open fireplaces, the fireplace in the hall being massive stone, with ornamental panels, and fitted with dog-grate. A lantern is fixed on the roof for observations. The works have been carried out, at a cost of £9,900, by Mr. R. Saul, of Moor-lane, Preston. Stabling, consisting of four stalls, loose-box, coach-house, and harness-room, are about completion in close proximity to the main block. The whole has been designed and superintended by Mr. T. Harrison Myres, A.R.I.B.A., of the firm of Myres, Veevers, and Myres, architects and land agents, of Preston.

ROUEN CATHEDRAL.

THE north-western tower of Rouen Cathedral, called the Tower of St. Romain, of which we give an illustration, was built during the second half of the twelfth century; it and the two side chapels of the apse, and the two magnificent side doors of the west front, form the only existing relics of the cathedral of that date. These works are of special interest to us, as having been built while Normandy and England were under the same rule. The remainder of the church was rebuilt early in the thirteenth century, under the rule of Philip Augustus, and it is curious to remark on the spot the differences in detail between the two periods—differences not at all to the advantage of the later work. St. Romain's Tower is one of the noblest remaining to us, and though the original completing portion of the design, if ever it existed, has given place to the charming flamboyant composition so well known to us, the dignity and simplicity of the earlier work are beyond all praise. It is specially remarkable for the extreme delicacy of all its projections, and the refinement of its profiles. In some instances there is all the effect of a set-off without any actual projection of the wall surface below a string, beyond that above it; and the powerful and graceful outline resulting from this careful study render this tower a subject of the highest value for those who have to design objects whose outline is thrown against the sky. Again, in the treatment of the angles, we find great ingenuity, the two diagonally opposed to each other being generally alike but different from the other two, so that, whichever way you look at the tower, there is a charming variety. The stair turret shown on

the drawing is a very happy composition, and it is quite possible that the original design for the completion of the fabric may, in some degree, have followed that which we now see as the termination of the staircase. The opening for admitting the bells is remarkable. M. Viollet-le-Duc compares this steeple with the grand contemporary example at Chartres, and thinks both may be the work of architects of the Ile de France. It is, however, very interesting to look at home, and to find such steeples as the south-western one at Chichester, where the work in many ways so much resembles that of St. Romain's Tower. The early work in the remainder of the church, excepting that contemporary with St. Romain's Tower, is not particularly good, but there is a magnificent late work in the south-western tower. The west front of Rouen Cathedral by moonlight, or with the sunset light catching the tops of the towers, and with the picturesque market-place below, is a sight not to be forgotten. There is a delightful etching of it in Cotman's "Normandy," showing the picturesque Renaissance timber spire of the central tower, which, on its destruction by fire, was replaced by the hideous cast-iron birdcage now so offensive in all views of the cathedral.—R. J. J.

NEW VILLA, BURTON-ON-TRENT.

THIS bijou residence, which we illustrate today, is about to be erected at Burton-on-Trent. Our illustrations comprise two perspective views, the same that were exhibited at the Royal Academy this year—two elevations and plans of all the floors of the house, which, being thus fully shown, seems to require but little description. The materials are red brick for the walling, with tiles for the roofs and upper walls, while half-timberwork is sparingly used in parts. Advantage has been taken, in planning the house, of the fall which exists from the frontage to the rear of the site. The sitting-rooms command a south-easterly aspect, and the dining-room has a commanding balcony facing the south, and communicating with the garden. Mr. Robert W. Edis, F.S.A., of Fitzroy-square, is the architect.

COMPETITIONS.

BUXTON.—The governors of Buxton Endowed School met on August 29 last, to decide the merits of the various sets of competitive drawings sent in for their proposed new school buildings and master's residence, when the designs of Messrs. Pollard and Showell, architects, of Manchester and Buxton, were adopted, and we understand that these gentlemen are entrusted to carry out the works, which will be commenced forthwith.

NORTHAMPTON CHURCH EXTENSION SOCIETY.—The design of Mr. G. Vials, of Doughty-street, has been selected in a limited competition for the Church of St. Michael and All Angels, Northampton; and a premium of £50 has been awarded to Mr. W. Smith, of the Adelphi, for the design placed second in merit. There were eleven sets of drawings by the following nine architects—viz., Messrs. Burder and Baker (the architects of St. Lawrence's Church, now being erected); R. H. Carpenter, T. Garratt, W. Smith, T. T. Smith, and G. Vials, of London; H. Holding, W. Scott, of Northampton; and E. S. Harris, of Stoney Stratford.

THE TURNERS' COMPANY.—The Turners' Company, according to custom, have offered their freedom, with other rewards, to the exhibitors of the best specimen of hand-turning in any of the subjects of competition, which this year include ivory, pottery, stone, and jet, and steel, brass, and gold for horological purposes. Pottery will comprise terra cotta, stoneware, earthenware, and porcelain, and stone and jet will include any natural substance of a mineral character, except those which require baking or burning. Lady Burdett-Coutts has offered a sum of £25 for money prizes to the competitors, and the court of the company has voted £50 for the same purpose. Among the judges are Sir Gilbert Scott, Sir Joseph Whitworth, Dr. Pole, Mr. Hutton Gregory, Mr. Doulton, and others. The articles will be on view some time in October at the Mansion House, and the Lord Mayor will distribute the prizes to the winners.

BASINGWERK ABBEY.*

THE site of this Abbey, on high ground overlooking the broad and extensive panorama of the estuary of the Dee, showed that it was not founded for the use of the Cistercian monks; and a confirmation of this suggestion presented itself in the traces yet to be seen close by of Basingwerk Castle, and the terminating point of Wat's Dyke. While, therefore, it might be regarded as determined that the Cistercians were not the first monks to settle at Basingwerk, there was no record of their arrival, and the dedication to St. Mary—universal in Cistercian abbeys—was shared by other bodies. Undoubted evidence proved, however, a religious settlement existed here prior to 1199, since, in that year, Hugh Lupus, Earl of Chester, being on his way to the well of St. Winifred, was attacked by the Welsh and sought refuge "in an abbey in the neighbourhood"—without doubt on this site. It might be safely concluded that the original foundation was by one of the early Princes of Wales, since the charter of Llewellyn ap Iowerth, and David, his son, mentioned donations given by their predecessors. These charters were of later date than Henry II. King Henry's (? III.) confirmation was but a grant of gifts to the monastery, and therefore no previous charters were referred to. The chapel at Basingwerk was given by the king, and described as being that in which the monks first dwelt, from which it might be inferred that new buildings were either just erected or in progress. However, the meagre documentary history had better be left till it could be better traced by probable future discoveries, although just two other points might be glanced at. The building, whose ruins the members saw before them, could not have existed (except some small part) in 1188, since Giraldus Cambrensis in that year stayed here for one night, and speaks of the monastery simply as a "small cell" ("cellula de Basingwerk"). Again, Henry II. founded somewhere in this locality a house for Knights Templars, for the Waverley Chronicle, under date 1157, speaks of King Henry having concluded works at Rhudlan Castle and Basingwerk Castle, and between the two a house for Knights Templars. Thus the title of Templars' Chapel, actually given the refectory here by Pennant, might be dismissed, for that house—of which no remains have yet been found—was miles away. The extract is also valuable evidence that Henry II., although he had masons at work repairing the adjacent castle (perhaps after the battle fought with the Welsh in 1156), did nothing to the existing abbey. Turning to the ruins themselves we find a perfect arrangement of a Cistercian house, remarkable not only for its completeness as far as traces remain, but for the purity of its design and the harmony among all its parts. The abbey church has a stype or sacristy adjoining its south transept; next in order, going south, the chapter-house, then probably the parlour, and lastly the day-room or calefactory. These form one side (the eastern) of the cloister space. The south side of the latter has in its south-eastern angle the kitchen, and next to it the refectory, which is built, as is so frequently the case, north and south. The buildings on the west side are gone. The dormitory extended over the whole of the eastern buildings. A large low range of buildings of brick and stone, with a superstructure of heavy oak timbers filled in with wattle and plaster, extends eastward from the kitchen, and formerly contained the cellars and store-houses. The church had its east end close to the bold cliff-like bank, which comes more or less to the whole northern side as well; and below the cliff, dividing it from the public road, is an extensive fish-pond, now divided in two by a high modern bank, which once carried a tramway. The church was cruciform, but at present all that is visible are the south gable of the south transept, with a triplet of lancets above the roof-pine of the abutting dormitory, the west wall of this transept, with the arch into the south aisle of the nave and one of the responds (the south-west) of the usual central tower with an attached column of the nave arcade in it; the cloister door, a small height

of the south aisle wall, and just enough of the west wall to enable us to make out the ground plan. The church was built of the brown sandstone of the district, not a very durable material, and the surfaces have crumbled away. The mouldings and other ornamental works have therefore suffered considerably, but can readily be made out. The aisle arch is of plainly chamfered orders springing from an abacus, and the same is observable above the engaged half round column of the nave. The face next the nave once had a third chamfered order, carrying the thickness of wall greater than the width of the pier. The capital is all but gone. The tower pier has a bold corbel to carry the additional thickness next the nave column, and space was thus obtained beneath it for the choir stalls. The bearing arches of the tower spring from very handsome corbels close under the springing, and not from shafts. The arches were of plainly chamfered orders only. The corbels and traces of the arches over are only visible to the south and west arches in the one solid pier, the only relic of the central tower. There is a trace of a clerestory window, and we may conclude that they were single lancets. There was no triforium. The cloister door, which is circular-headed, has been carefully moulded with clustered beads, hollows, and bowtells in several recessed orders, and the west (central) doorway into the nave has probably had a door somewhat similar, but only traces are visible for a recessed order or two to the south jamb. In the south wall of the transept is a portled doorway, to afford access to the night stairs from the monks' dormitory; the stairs were of wood, and have quite disappeared. There are two lines of roof of the north aisle of the nave visible, showing a reconstruction at a later date. The style of the church is Early English of a good type, and when perfect of excellent effect. The base of the south wall of the south transept is earlier, and may be a portion of the "small cell" which existed in the time of Giraldus Cambrensis. The main body of the chapter-house has disappeared, and the two conspicuous round-headed arches, often taken for the entrance, in reality only lead into an eastern projection of the house. This is also of Early English type, and has been vaulted with quadripartite vaulting, but with additional ribs to meet the piers of the three eastern lancets. It was, probably, covered originally with a lean-to roof, but in 15th century times a chamber was constructed over it, probably the monument-room. The chapter-house proper had a flat ceiling, and the dormitory a boarded floor, since the holes for the beams remain. The day-room must have been a spacious apartment, lighted by an eastern range of broadly-splayed lancets, which have no rebates for glass; they may, however, have been glazed with moveable frames secured to the iron stanchion bars. The dormitory over has also a range of eastern unglazed windows. The walls are too much broken by gaps to show any fireplace. A small doorway has opened from the south-east angle, probably for the passage of the sacristan, to watch the sanctuary light, as at Valle Crucis. The kitchen adjoined the day-room; of it enough remains to show that it was of late 15th century work. The refectory is a remarkable building, which has been of much beauty. Buck's view shows it with a roof, a perfect gable cross, and with four lancet windows. It is now roofless, and the gable is broken down to the ground level, leaving thus but the three external walls, and two jambs only of the gable windows. Internally the building is filled with a series of varying splayed niches, some of which have been pierced with windows now blocked; these are adorned with beautifully moulded shafts, banded and with caps and bases, and arched heads above. The whole of the eastern wall has a perfectly plain surface, in curious contrast to the opposite one; it is probably of later date. The cloister space has been occupied by an ambulatory around its four sides of wood, covered with a sloping roof. The long range of offices to the eastward of the kitchen are of interest on account of their almost unaltered condition, but they are in a terrible state of neglect, the eastern part being partially unroofed. The upper floor, approached by probably the original rough

stone steps, is used in part for a storage of tanned hides, while in others various savoury stages of a tanner's business were being pursued. The history, as told by the ruins, agrees in the main with recorded history. We have traces of an early building, and we have a later and perfect Cistercian plan. History is doubtful on the date of the latter, but Architecture tells us that this must have been carried out early in the thirteenth century, and by English rather than by Welsh hands. The usual traditions with respect to the removal of portions of the building to other places are as numerous here as elsewhere in Wales. A part of the roof is said to be at Cilcain Church; this is perhaps as true as that of the glass of Gresford Church, so far away, being also from Basingwerk. In conclusion Mr. Loftus Brock called attention to the neglected condition of the abbey ruins, and expressed a hope that that meeting would be the means of effecting some improvement. Since, said the lecturer, the foundations of the entire ground plan are most probably perfect beneath all the signs of neglect which surround us, it is greatly to be desired that a little care and attention should be bestowed, not only for the preservation of what is left, but also for the uncovering of what is buried. A small outlay and a little loving care only are needed to render these remains as interesting in proportion to their extent as those of Valle Crucis, and the accumulated earth might cheaply be formed into a barrier to preserve them from further havoc.

TIMBER OF NEW SOUTH WALES AND HONDURAS, AND ITS PROPERTIES.

BESIDES the wood produced by the forests of Europe and India, the most useful of which have already been mentioned, there is an abundance of varieties even in our own colonies to render us hopeful as to the sources of our timber supply holding out for as long as there is a demand for it. In New South Wales we find as follows:—Flooded gum, which is remarkable for durability as a ship timber, and has been known to be in use for that purpose thirty years without showing any symptoms of decay. Ships' knees are supplied in any quantity and in any size by the branches. Beef wood, or silky oak, is of extreme beauty, and has a pale red-brown mottled colour, with an undulating figure, perfectly uniform, hard texture, and easily worked. Cork tree supplies good wood for turning and carving, and is much of the nature of good poplar, so that it could be made use of for building purposes. Iron bark, of Illawarra, is a most durable wood of indestructible properties. Posts of this have stood exposed in the ground for thirty or forty years without being even corroded in any part on the surface. Turpentine tree is a heavy good wood, procurable of any size, the tree being of the largest dimensions. It is so full of resinous matter that it wholly resists both damp and white ant. It is the best wood for railway sleepers, and posts of it have stood for twenty years. Red mahogany is a capital wood, of fair colour and appearance, and is useful for most ordinary purposes. Stringy bark makes such excellent tree-nails that large quantities are annually exported to England. Water gum is a close grained tough wood, extensively used for all machinery purposes, and apparently well adapted for the same. White pine is a close-grained, but easily worked, cabinet wood, of considerable value. Cypress, or Moreton Bay pine, is a well-known and superb tree that requires no detailed notice. It yields spars 80 to 100ft. long, and one tree has been known to yield 10,000ft. of timber. Some of the wood is remarkable for the peculiar figure set up, which resembles drops of rain in general effect, and is not easily described. The sapwood appears to be peculiarly liable to rot. *Ficus macrophylla* is a most delicately coloured and beautiful wood of a uniform pale brown, with a beautiful wavy figure of a darker brown. It occurs of immense size; the trunks lengthen to 15ft. in diameter, with immense buttresses. *Flindersia Greavesii* is the monarch of the northern forests, and an invaluable wood for general purposes. Rosewood is of extraordinary beauty at the heart, clouding off into the rich yellow sapwood in the

* Abstract of a paper by E. P. LOFTUS BROCK, F.S.A., hon. secretary, British Archaeological Institute. (See p. 226 in last issue.)

most delicate wreaths. The heartwood is not broad, but nothing can be more beautiful. *Castanospermum Australis* is much praised as a useful furniture wood and for general purposes, of immense size, and when well cut yields a very good figure of pale brown colour. Besides these there are other trees, all useful for furniture and general purposes, some of them being of great beauty.

We will now turn to Honduras, and here we shall find many useful woods not generally known here, but which may some time be sought after, such as acacia, a very durable, hard, brown wood, used for house-posts, piles, &c. Alligator pear, a very durable brown wood, but not abundant. Wild hazel tree, used with success for building purposes. Balsam tree, measuring from 12 to 16in. in diameter, with a red, close, hard wood, suitable for building, and used for rollers in sugar mills. Bullet tree, large, with hazel brown wood, close and hard, used for building purposes, and very durable. Cabbage or partridge tree, close and hard, and of a brown colour. It is very durable, withstands the action of water, and is of much value for sleepers and bridge timber, also shipbuilding and cabinet work. Camphor wood, used for house posts, bridge timber, and sleepers. It is a large tree, which grows to about 24in. diameter, with a coarse, soft, stringy wood. When newly cut it has a pleasant odour, is very durable, and stands the wet like few other woods. Cedar grows to a large size, and in Honduras is used for house-building. Four to six feet in diameter is frequent. Cotton tree grows to a diameter of 8 to 12ft. The wood is whitish-yellow, light, not very durable, but easily worked. For inside work it would probably be found a good building wood. Billyweb is a tree growing from 12 to 16in. diameter, with a brown-coloured wood, very elastic, and one of the most valuable woods where durability, toughness, and in fact any of the qualities of the *lignum vitæ* are required. It is used for bridge timbers, house-posts, trenails, machine frames, &c. Dogwood, a hard, dense, brown, durable wood, much esteemed for shipbuilding, knees of this timber being very durable. Live oak does not acquire a large size here, growing seldom to more than 16in. diameter. Used for sleepers, house-posts, &c. Fustic is best known in this country as a dyewood, but is used in Honduras for building purposes and also in shipbuilding; and rosewood is too well known to need notice here. Redwood is used for house-building, and for any work in the ground. It is a middling-sized tree, growing to about 16in. diameter, with a dense hard red wood, and very durable. Black mangrove, dark, hard, and tough; is very durable, dense, and heavy, and is used for such purposes as piles, sleepers, and house-posts. Red mangrove is a red, hard, elastic, straight-grained wood. It is used for house-building and is very durable in the ground and water. White mangrove is a tree with a white wood, and though not very durable is used for dry works in house-building, and answers for such purposes very well. Mahogany, though needing no description, is used in Honduras for house-building, bridge timber, and shipbuilding. Sapodilla is a tall tree, with dense hard red wood, and is very durable on land or water. It is used for building purposes, rollers for sugar mills, and for eccentric turning. Pine, yellow or pitch pine, is very abundant. The wood contains a great quantity of turpentine, and is very durable in and above ground, as well as in the water. It is used for building purposes, piles, and shipbuilding. Oak resembles that of England, and grows on high ground, above the lines where pines grow. San Juan is a tall tree, growing to above 2ft. in diameter, with a light yellow wood, very durable for dry works, and used extensively for building purposes. Santa Maria is a tall tree resembling mahogany, of whose character it partakes. It is, however, of more density, of a dark brown colour, and very durable. It is considered a very valuable wood for shipbuilding, and is one of the best woods known in Honduras for wet works—as piles and foundations—as well as for machinery, frames, rollers, &c., as it contains no acid, is cross grained, not brittle, and very resisting. It is abundant at a short distance from the coast. Savicer is a large tree, with a heavy

red durable wood, of the dark mahogany character. This wood is highly esteemed in shipbuilding purposes, bridge timber, and sleepers. Sea-side grape is used for building, sleepers, knees, and also for eccentric turning. It always grows in the vicinity of the sea, with a dark red, fine grained, hard wood, which is very durable. Lancewood is principally used for cart shafts. It grows from 3 to 6in. in diameter, is of a pale yellow colour, and very elastic. Yellow wood is a middling-sized tree, up to 16in. diameter, with very little sap, the wood light yellow and close grained, somewhat resembling boxwood. It contains a yellow dye, but in a smaller proportion than fustic. It is used for building, and might be employed for engraving.

LIVERPOOL ENGINEERING SOCIETY.

THIS society held its usual fortnightly meeting on Wednesday, Sept. 12th, at the Royal Institution, Colquett-street; Mr. C. Graham Smith, A.I.C.E., President, in the chair. Mr. Squire, the honorary secretary, exhibited some interesting samples of mortar. A sample of mortar from Sandown Castle, Kent, built in the 16th century by Henry VIII., stood as high a tensile strain as 263lb. per square inch, notwithstanding that the section was rough and not calculated to give a high breaking strain. Mr. Alfred Holt, member, lately brought a piece of mortar from Nicopolis, a city built to commemorate the victory of Actium, B.C. 40, and a place of no little interest in the present war. This mortar, although rough and honey-combed, appears as hard as stone, and the president on this account cited it as another proof of the correctness of his theory that the ancient mortars owe their strength more to the high quality of the materials than to any special qualifications or particular care bestowed upon their mixing. A paper by Mr. R. F. Pitt, member, was then read, the subject being "Piecework v. Daywork." Although a strong advocate for "piecework," under most circumstances, he endeavoured to take an impartial view of the question. He considered that the labour question was entirely governed by the laws of supply and demand. He stated that piecework enables the men to earn higher wages than by daywork, and the employer gets a larger amount of work done. He is also in a position to make larger sales and turn his capital over more quickly than otherwise. On the whole he thought it decidedly advisable to adopt piecework, when dealing with navvies, masons, quarrymen, and other similar descriptions of labour.

ARCHÆOLOGICAL.

EXCAVATIONS INTO MOUNT CABURN.—During the past week, by permission of the Speaker of the House of Commons, Col. Lane Fox has been engaged with workmen in making excavations into Mount Caburn, Sussex, on behalf of the combined committees of the British Association and Anthropological Institute. A number of pits, square, oval, and round, were found in the interior of the camp, and some have been opened. They are of different sizes, and between 6 and 7ft. deep. They appear to have been human habitations, and would contain two persons crouched together, but there is not room for them to lie extended. The pits contained a large quantity of bones of animals used for food, chiefly of the ox, pig, and goat. These remains have been sent to Professor Rolleston for identification. At the bottom of the pits were found some pottery and several implements of late Celtic type, including a knife, battle-axe, iron spud, and a bone comb. A large basin-shaped shaft, 16ft. deep, had been cleared on the south side of Mount Caburn. It is difficult to ascertain for what object unless it might be for obtaining flints similar to those of Cissbury. A vein of flints runs near the bottom of the hollow, but there are no galleries as at Cissbury. On Saturday a section was cut through the rampart, and large quantities of pottery were found of a character anterior to that in the pits. During Monday's excavations nothing was unearched beyond remains of burnt stakes, showing that the fort was defended by a palisade.

Building Intelligence.

ADDINGTON, BUCKS.—A school, with house, has been built here for the Right Hon. J. G. Hubbard, M.P., of Thornborough bricks, with dressings of Corsham stone. The whole has been well carried out by the workmen on the estate, from the designs and under the superintendence of Mr. E. Swinfen Harris, jun., of London and Stony Stratford. The chimneys are all made of handwrought bricks, and there is much detail throughout.

APPLEDRAM.—The parish church of Appledram, near Chichester, was re-opened after restoration, on Thursday, September 6th. The work of restoration has been carried out by Mr. Lacy W. Ridge, the diocesan surveyor. The church consists of nave, chancel, and side aisle, all of the purest Early English type, and is remarkable for three triplets of lancet windows, the lights separated by Purbeck shafts—viz., one triplet at the east end and one on each side of the chancel. The mouldings to these are unusually rich and in perfect preservation. A squint affords a view of the altar to the occupants of the aisle; it is surmounted by an elegant ogee arch. The original marble font, for many years partly imbedded in one of the pillars, and supported on a mass of brickwork, has been removed to the original site, the central shaft supporting it having been discovered among the bricks, and supplemented by four Purbeck dwarf pillars with carved stone caps and bases. The pews have been replaced by convenient open pitch-pine benches, and those in the chancel by solid carved oak seats. The porch has been partly rebuilt, being much decayed, the Perpendicular character being reproduced. The total cost has been nearly 1,000l.

ADSTOCK, BUCKS.—A school has just been built here for the Adstock School Board. The materials are the local red brick, with tile roofs, capped with Cooper's ridges and finials; oak bell-turret, covered with shingles; half-timber porches for boys and girls. The work has been carried out by Messrs. Marshall and Boyse, of Buckingham; and the architect was Mr. E. Swinfen Harris, jun., of London and Stony Stratford.

BRISTOL.—Scaffolding is now being erected in order to take down the church of St. Werburgh, Bristol. Mr. J. Bevan, architect, of St. Leonard's Chambers, Nicholas-street, Bristol, has been entrusted with the task of superintending the removal of the church and re-erecting it in Mina-road, Baptist Mills, and under his supervision it is intended at first to take down the tower as far as the roof of the body of the edifice. In the re-erection of the church the old materials will be used as far as practicable, and the style be maintained intact, with one or two slight exceptions, Chief among these is an important addition to the ornamental pinnacle on the old tower, which is referred to the fourteenth century, whereas the body of the church was rebuilt in 1761. The architect has also taken the liberty of introducing a slight alteration in the upper parts of the windows by adding additional mullions—thus bringing them into accord with the period in which the church was built. The existing windows are copies of some poor fifteenth-century work. An extra bay will be added to the nave, which at present consists of four bays. An additional length of about 13ft. will thus be secured to the church. The new building will be 106ft. in length by 59ft. in width, and will accommodate about 600 worshippers. A chancel is to be added, with a vestry for meetings, and an organ chamber. Underneath the north aisle will be a muniment chamber and crypt. Messrs. Wilkins and Sons are contractors for removing the old church and re-erecting it at Baptist Mills.

CHURCH RESTORATION IN NORTH YORKSHIRE.—Quite an impetus is being given to church restoration in the North Riding just now. A new chancel, 25ft. in length, has been added to the fine old church of St. Mary's, Rokeley, as a memorial of the late Mrs. Marritt; it contains a stained-glass window representing the dedication of Solomon's Temple. At Pickering, the old church of St. Peter is in the builder's hands; the work is

estimated to cost from £7,000 to £8,000. The fine Norman tower (of about the period of 1130) is being restored, the north transept rebuilt, and that on the south side repaired, the chancel re-roofed, and for unsightly pews oaken stalls are being substituted. At Old Malton the church of St. Mary—a remnant of the priory founded by Eustace FitzJohn in 1150—is being restored under the direction of Mr. Fowler Jones, architect, of York. The magnificent Norman tower, which is in very ruinous condition, is being rendered safe, and when this operation is accomplished the repairing the exterior of the building will be gradually taken in hand. The estimated cost of the works contemplated here is over £6,000; it will be borne by Earl Fitzwilliam.

DUNLEWY.—On the 29th of August the new Roman Catholic church of the Sacred Heart, at Dunlewy, Co. Donegal, was dedicated. The church, built in Romanesque style, with a round tower for a belfry, is from the designs of Mr. T. Hevy, of Belfast, who studied many years with the late Mr. Pugin. The altar is carved in Caen stone, with pillars of dark green marble, and flanked by statues of Our Lady and St. Joseph, from the works of Mr. Harrison, of Dublin. The windows are narrow, filled with stained glass from the manufactories of Messrs. Early and Powell, in Dublin.

DUNFERMLINE.—A new public hall at Dunfermline is approaching completion. The building, which has been designed by Mr. John Starforth, architect, York-place, Edinburgh, is in the Early English style. The principal frontage measures 92 feet in length, and 40 feet in height. The interior embraces an area which nearly forms a square. The large hall is 80 feet in length, 60 feet in breadth, and 43 feet in height. It will afford accommodation for an audience of 1,320 people—770 on the ground floor, and 550 in the gallery. The orchestra and gallery occupy a space of 42 feet by 21 feet. The lesser hall is on the second floor of the southern front, and measures 56 feet in length, 28 feet in breadth, and 26 feet 6 inches in height. On the ground floor there is a suite of committee and retiring rooms, lavatories, &c.; and in the upper parts of the building there are capacious reading and billiard rooms. The building will cost upwards of £9,000.

EDINBURGH.—On Friday last, at a meeting of a sub-committee of the Lord Provost's committee, estimates were accepted for the carrying through of the work in connection with the proposed extension and alteration of the Corn Exchange, as formerly agreed upon by the Town Council. The lowest tenders amounted in all to £5,067, and consisted of the following: Masonry, £3,183, Messrs. Bishop and Sou; joiner work, £1,160, Mr. David Pullar; and plumber, plasterer, slater, and ironwork, £724. Under the Edinburgh Markets Act of 1875, power was obtained by the Corporation to acquire properties in proximity to the Exchange, with the view to carrying out the improvements contemplated. Mr. Morham, city superintendent, thereafter prepared plans showing how it was intended to utilise the ground in question on the demolition of the existing tenements, which are to the south and west of the market. The new buildings have been designed in the old Scotch style of architecture. The additions to the Exchange will include an implement hall, a bag store, and a large general store-room to the back, with ample access for carts along the west side of the building. A tenement to the west of the Exchange, which is in a dilapidated condition, is to make way for a large four-story building, the ground floor of which is to be used as settling-rooms, weighing-rooms, &c.

ETON COLLEGE.—During the long vacation in the new mathematical schools, which have been erected on the west side of the Slough-road, some of the class-rooms have been re-arranged to meet the requirements of the masters and boys. The structure is of red brick and white stone, built in the Gothic style by Mr. Wheeler, of Reading. There are 16 class-rooms, 10 of which will accommodate a master and 25 students each, the other six being each large enough for a master and 39 pupils. There is, therefore, sufficient school-room for 16 masters and 484 students. The façade of the building accords with the other architecture of the

college. The battlemented roof is here and there ornamented with lofty pinnacles, and in the centre of the front, carved in white stone, are the Eton arms and the date.

GORSLEY, GLOUCESTERSHIRE.—An apse has been built to the school church here of the local stone, with Bath stone dressings and open timber roof. There is also a new stone bell turret over the chancel arch. The apse was opened by the Bishop of Gloucester and Bristol on the 4th August last. The cost has been defrayed by subscriptions collected by the incumbent, the Rev. E. H. Sankey. The parsonage-house, forming a group with the little church, has been built some months, of the local stone, with brick dressings and tile roofs. The cost, inclusive of roads, fences, &c., was less than £800. Both the works have been carried out by Messrs. H. and R. James, builders, of Newent, from the designs and under the superintendence of Mr. E. Swinfen Harris, jun., of 32, Craven-street, Strand, London, and Stony Stratford.

NORTHAMPTON.—On Thursday week the new Wesleyan chapel in Regent-square, Northampton, was opened. The total cost has been about £4,500, and the chapel, which has been built by Mr. Watkin, in accordance with plans prepared by Mr. Newman, is Italian in style. Red pressed bricks have been used, the front being relieved with moulded Bath stone dressings. The building has a coved, panelled, decorated roof, and from it are suspended two brass chandeliers. Iron columns, slightly ornamented, support the gallery, and appear to be continued to the roof. Underneath the chapel is a commodious infants' school-room, furnished with a gallery. Around it are five class-rooms, with heating apparatus, &c., and above these are the two vestries which are at the rear of the chapel.—On Monday the memorial stones of a new Primitive Methodist school were laid at St. James's-end. The cost of the building will be about £345, the contractor being Mr. Branley, of St. James's-end, and the architect Mr. E. H. Lovett, of Duston, who gives his services voluntarily.

SIMONBURN.—The ancient church of St. Mungo, at Simonburn, which has been restored, was re-opened on Tuesday week. The architecture is Early English, of the type peculiar to the great church-building era of Northumberland, a long chancel of 48ft. being joined to a late Norman nave, and aisles of 6ft. in length. The idea has been carried out during the restoration of replacing, as far as possible, each part in accordance with the architecture of the period of its erection. The arches and walls have been re-dressed and pointed, throughout the church. An Early English porch, designed from the priest's door of the chancel, has been added. A timber roof of stained pitch pine has replaced the ceiling. Mr. R. J. Johnson, of Newcastle, was the architect, and the work has cost about 2,700l.

SNEINTON, NEAR NOTTINGHAM.—A large and handsome set of Board schools, accommodating 637 children, were opened on the 10th inst. A caretaker's house, with board-room attached, is provided. The accommodation is for 210 boys, 210 girls, and 217 infants. Each department has a large school-room and two class-rooms. The walls are of pressed red brick, with Bath stone dressings. The roofs are covered with blue and red tiles, with red ridge. The playgrounds have covered playsheds. The schools have a frontage of 232ft., and are broken up by projecting gables and traceried dormer windows. A lofty and handsome bell turret covered with lead forms a pleasing feature in the depth. The schools are very lofty, with open-timbered roofs, stained and varnished. A dado of red deal, stained and varnished, extends round all the schools and class-rooms. Windows are obtained on each side of schools and class-rooms. The schools and class-rooms are heated with hot water. The playgrounds are asphalted. The buildings were erected by Mr. Henry Vickers, of Wilford-road, Nottingham, at a cost of a little over £6,100. They are erected from the designs and under the superintendence of Robert Clarke and Son, architects, Nottingham.

ST. MARGARET'S, WESTMINSTER.—The old church of St. Margaret's is now undergoing restoration. It has been affirmed that King

Edward the Confessor caused this church to be erected close to the Abbey, which he was then building, dedicating it to St. Margaret, the virgin martyr of Antioch. About 200 years afterwards the church was destroyed by accident, and rebuilt by the parishioners and merchants of the Staple. Some other parts are said to have been rebuilt in the reign of Edward IV., and particularly the south aisle by Lady Mary Billing, and her husband, Sir Thomas Billing, Chief Justice of England in that reign. In 1735 the tower was rebuilt, and the church finally ceiled with money granted by Parliament. The stained-glass window in St. Margaret's Church has a long history. The magistrates of Dort, in Holland, being desirous of presenting King Henry VII. with something worthy to adorn his magnificent chapel then building at Westminster, directed this window to be made, which was five years in finishing. King Henry and his Queen sending their pictures to Dort, whence their portraits in the window are taken. King Henry died before the window was completed, and it fell into the hands of an Abbot of Waltham, who placed it in his abbey church, where it remained till the dissolution of that abbey by Henry VIII. (A.D. 1540). To preserve it from being destroyed it was removed by Robert Fuller, Abbot of Waltham, to a private chapel at New-hall, in Wiltshire, an ancient seat belonging to the Earls of Ormound. In Queen Elizabeth's reign New-hall was the seat of Thomas Ratcliff, Earl of Sussex, and afterwards his family sold the window to George Villars, Duke of Buckingham. His son sold it to General Monk, who, to preserve it, caused it to be buried underground during the Civil Wars. After the Restoration General Monk caused the window to be replaced in the chapel of New-hall. That chapel was suffered to become ruinous by his successors, but the window was still preserved. It lay for some time cased up in boxes, until Mr. Conyers purchased it for his chapel at Cophthall, near Epping, and paid an artist named Mr. Price a large sum of money for repairing it. There the window remained until his son, John Conyers, building a new house at some distance from the old seat, had no further use for it, and sold it for the sum of 400 guineas to the committee appointed in 1758 for the repairing and beautifying of St. Margaret's Church.

ROATH.—A new Baptist chapel (Zion) was opened in Longcross-street, Roath, on Wednesday. The building is Gothic in style, and includes, besides a chapel for 300 persons, school-room, vestry, and underground boiler-house and offices. Dark blue grey Newbridge stone and Bath dressings have been used in construction, and the internal wood fittings are chiefly of pitch pine, the pulpit having oak panels. The seats are varnished, but not stained. The pulpit is placed on a slightly raised platform, with baptistry beneath. The walls and windows of the chapel have been so planned as to admit of the addition of galleries, so they be needed. Mr. Peter Price, of Cardiff, was the architect, and Mr. Trotman the builder, the stonework having been done by Mr. Roberts. The cost has been £1,600.

WEST DULWICH.—The consecration of Emanuel Church, West Dulwich, took place on the 8th inst., by the new Bishop of Rochester. Nearly four years have elapsed since this church was projected, and now only so much has been erected as could be completed for the sum of £6,000, thus necessitating the omission for the present of two bays of the nave and the upper portion of the tower and spire. That which is done has, however, been well done, and consists of the shortened nave and aisles, the transepts, the chancel, the major part of the tower, and the clergy and choir vestries. The church is in the style of the thirteenth-century French Gothic, and is faced externally with Kentish rag and Bath stone dressings, and internally it is lined with white bricks and stone. The nave arcade, with its carved caps and clustered pier-shafts of Doulton stone, sustains a clerestory pierced with plate-traceried windows. The polygonally-ended chancel has five similar windows within an internal arcade. The reredos of Caen stone, inlaid with mosaics, is raised in front of the deep-coloured tile dado surrounding the east end. The whole of the chancel, 33ft. by 20ft.

wide, is paved with Maw's tiles. The pulpit is of Caen stone and alabaster; the eagle lectern is of brass; the choir stalls are of pitch pine. The organ, by Hill and Sons, is situated in the upper stage of the tower, below which is the chief entrance. The church is heated by warm water, and fitted with cushions throughout, and accommodates 550 adults, which will hereafter be raised to 900. The architect is Mr. E. C. Robins, of 14, John-street, Adelphi, and Messrs. Adamson and Sons the builders; Mr. Woodley the clerk of works; Messrs. W. B. Simpson and Co. executed the tiling and mosaics.

CHIPS.

Mr. Layard, the British Ambassador, has received a firman from the Sultan, authorising excavations at Nineveh.

The War Department has been asked to sanction the removal from the river front of the Tower of London of a very unsightly three-storied warehouse of wood and brick, which stands between two of the ancient portions of the building. There are hopes that the efforts which are being made for its removal will be successful.

The erection of two new Board Schools for Thornbury, by the Calverley-with-Farsley School Board, is now being carried out. The schools—mixed and infants—will together accommodate 500 children. The style is Gothic. The buildings are being erected under the superintendence of Mr. J. P. Kay, architect, Leeds, and are estimated to cost £4,405 10s.

A new redos is about to be provided for the parish church of Torrington. The work will be executed, under the supervision of Mr. R. Medley Fulford, architect, of Exeter, by Mr. Harry Hems. The redos will extend right across the chancel, and will rise at its highest point to the height of 12ft. Constructed in the main of Beer stone, its principal feature will be a large sculptured panel of Caen stone, representing the Last Supper, carved in high relief.

The foundation stone of a new church was laid on Wednesday at Parracombe, Devon. The old church will be so far renovated as to answer the purpose of a mortuary chapel. The cost of the new building will be about £3,000. The plans of the new church have been prepared by Mr. W. C. Oliver, of Barnstaple; the contract has been entered into by Messrs Bevan and Sons.

The Local Board of Health of Southend-on-Sea have decided to lay out at once a sum of £15,000 in alterations to the pier and the foundation of a new tramway pier on the west side of the existing structure.

Plans have been prepared by Mr. C. Pertwee, of Chelmsford, engineer to the Witham Rural Sanitary Authority, for works of water supply and drainage for Great and Little Coggeshall. These are expected to involve an outlay of about £8,000, if adopted.

The Duke of Devonshire has offered the Eastbourne Local Board of Health, free of charge, a piece of ground near the Union-house at Old Town, containing 5 or 6 acres, as a public recreation ground. The gift has been accepted with thanks.

Eckington parish church, Derbyshire, is being restored. The old pews are being replaced by benches, and the west gallery is to be removed.

A water supply has been provided and given to the village of Middleton-by-Youlgrave, near Bake-well, by the liberality of Mr. J. M. Bateman, the owner of the hall, from his own designs, at a cost of about £1,100. Mr. Bateman has forced water by means of a 27 horse-power engine, from the Bradford brook in the dale into tanks on high ground above the village.

Sixty-two persons applied to the Burton-on-Trent Rural Sanitary Authority last week for the appointment of inspector of nuisances, to which is attached a salary of £200 per annum. It was bestowed upon Mr. Barry, who at present holds a similar situation under the Sheffield Town Council.

Mr. E. F. Hall has been appointed inspector of nuisances to the Clay Cross Local Board of Health. The same body accepted, on Wednesday, three separate tenders for the execution of drainage works in the district. These amounted in the aggregate to £713, whereas a contractor from Clowne asked £1,850 for carrying out the entire scheme.

The Derby Town Council has requested the Sanitary Committee to consider and report as to the disposal and utilisation of sewage preparatory to taking action as to a scheme for the enlarged borough.

Chapels and a lodge are in course of erection for the Burial Board of Pentre (Rhondda), South Wales, from designs and plans by Mr. Lovegrove, of London. Messrs. Charles Jenkins and Co., of Treherbert, are the contractors.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published September 14 contains articles on Vaccination, Hospital Mortality, On the Incongruity of Milk Analysis, The Causes of Disease in Country Homes, House Drains in Relation to Health, The River—(a long way) after Tennyson, The Social Science Congress, Public Health Reports, Legal Intelligence, Water Supply and Sanitary Matters, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c. Price 2s. Annual Subscription post-free, eleven shillings. J. Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces. Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) for any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding hack numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—M. G.—T. H. M.—M. J. D.—J. A. M.—C. of R.—J. M. G.—T. L. B.—F. W. A.—E. H.—D. C.—C. H.—C. of P.—G. B.—G. H. S.—G. S.—J. J. M.—L. and N.—T. H. S.—A. N. P.—M. V. and M. "BUILDING NEWS" DESIGNING CLUB.—W. Herring. (If you refer to the BUILDING NEWS, p. 219, you will find, in answer to "Perplexed Student," the same question answered. From 8ft. to 10ft. superficial is generally allowed for each child.)—J. Harris. (Your suggestion will be considered.)—H. (There are many architects members.)

ARCHITECTURAL SCIENCE CLASS.—In reply to "A. E." and several others we contemplate commencing another series of questions.

PUPIL. (To give a list of the best books for studying architecture would be to fill a column of our space rather unprofitably.)—C. J. E. (There are several books published to explain algebraic formulae, such as Tate's "Elements of Algebra;" but if you send the formula we dare say we can tell you how to work it out in plain figures.)—We have a drawing of an old oak chest signed "M. R." Will the author oblige with his name and address, so that the drawing may be returned to him?—Drawings received: H. C. Harris, F. W. Hagen, C. C. Hodges.

Correspondence.

MASONS v. BUILDERS.

To the Editor of the BUILDING NEWS.

SIR.—Referring to the masons' strike in the building trade, and looking at it from an outside point of view, it seems there is but one way to decide it fairly—viz.: Let the employers concede and the masons accept the principle of piece-work; then let the committees of the Employers' Association and the Masons' Union meet, and each committee choose, say, five men of their own body to settle the dispute once and for ever, by agreeing upon a scale of prices to work by piecework on the basis of 9d., 10d., or any other price per hour, arranging the scale of prices according to the work performed by a fairly competent and industrious workman.

I have spoken to many on both sides of the question, and they agree that the standard should be the average workman. I may also say I have not met with a single instance of opposition to a carefully-arranged list of prices, to which both parties could agree. Many have expressed a wish that prices could be so arranged and agreed. Surely, as before-named, the committees might easily settle this. As an argument, by way of illustration, take any

stone—say Portland, as a typical one; then go to Portland, look at a grass field, and watch its breaking up to make a stone quarry, the breaking up or uncover, getting, cutting, and scrapping, the loading on the ploughs,* the carriage by local railway, the loading from same into other railway trucks or ships, the carriage by ship or railway, the cartage to builder's or master mason's yard, nay, the sawing into scantling, all the several labours are performed by piecework. But, as soon as the Portland stone, thus quarried, carted, and sawn, comes to the mason's banker, the world of fact is left. After that no one can tell with anything like precision what the cost of labour will be on any stone before it is sent out to be placed as a goodly stone in the intended building.

This ought not so to be, and many good men and true (although Union men) would, if permitted by their fellows, be as ready to render as good account of their labour as any other trade, be it bricklayer, joiner, plasterer, plumber, slater, tinker, tailor, or candlestick-maker, and to sum it up at the end of the week, sometimes astonishing the employer or pay clerk by the amount.

Let the two committees settle the prices to be paid for each kind of labour, and it will then be seen if there is any truth in the hackneyed argument—viz., that the best workmen pay for the inferior or less skilled workmen, as a good opportunity will be afforded these good workmen to exhibit their philanthropic ideas by dividing the excess moneys they earn amongst those who are not actually or physically up to the average. For instance, A is a fair average workman, earning, say, 50s. per week; B is more than an average workman, earning easily at the same rates, say, 60s. per week; while C, although industrious, working closely, and losing no time, yet somehow the fact is he cannot, do what he will, earn at said rates more than 40s. per week, or 10s. below the fair average workman. Here the good workman's philanthropy should come into play; but instead of the good workman, who earns 60s. weekly, giving his extra 10s. to the less skilful or 40s. workman, thus making each of them equal, he (the good workman), or, rather, perhaps, his society, wants the employer to make them equal, and pay the acknowledged inferior workman 10s. more than he can fairly earn; or, in effect, asking the employer to make the inferior workman a present of 10s. weekly. No wonder, to use a common phrase, that the employer "does not see it." He would see it, and appreciate it too, if all his best workmen, after receiving their money at the pay table, immediately called together their fellow workmen, and said to them, "Look here, you have worked as hard and as many hours as we have; you require as much food as we do; come in here and we will divide with you, so that all shall be equal." One such instance would be worth a thousand theories.

The good workman says, or his Union says for him, "I make up for the shortcomings of the inferior workman." Does he? Again I say "the employer does not see it." The honest inference is, if all men are paid equally, they are all reduced to the level of the inferior workman. Moreover, it is a well-known fact that the more than average workman is frequently cautioned not to push his work, but rather to nurse it, so that the inferior workman may keep pace. The effect of this is to lower the standard. Nevertheless, if a fellow-workman branches out, and takes a job, either as a master or as a sub-contractor, he does not, will not, pay all his men equally, showing that, as soon as his pocket is touched, he practically believes all men are not equal, the Union principle notwithstanding. I therefore repeat, let the committees make a fair and honest arrangement for piecework between employer and employed, and we shall hear no more of strikes, with all the evils which follow in their train.

To this simple arrangement I am aware many on both sides are not disposed to agree. The one because he would have to employ additional clerks, which he can ill afford; the other, because he has an ill-defined idea that

* A long team of horses, attached to a stone truck in single file is locally called a "plough."

if he works piecework he loses his dignity and self-importance, and becomes a slave to be driven by whomsoever may be the overseer. Still, I think the only panacea for strikes is healthy piecework, and if men and masters (or, I suppose I ought to say, "employers and employes,") would only set to work and agree to try it, we should hear no more of strikes.

The employer is bound to give, as per bills of quantities furnished him, a price for the several kinds of masonry, plain work, sunk work, moulded work, &c.; and why should there be any difficulty in the workman doing the same?

I am quite free to admit that the Union, or men's advisers, should have a large say as to what the price for the different kinds of labour should be, but once the same is fixed it should not be disturbed lightly by either party.—I am, &c.,

STONE.

THE NORTH LONDON CONSUMPTION HOSPITAL.

SIR,—While thanking your critic for his very favourable remarks on my design for the above, in an article in your paper of the 7th inst., may I be allowed to point out a slight inaccuracy in its description of its features? He says: "The corridor of communication is placed in front, and forms an arcaded balcony of timber externally, resting upon a stone arcade of Gothic design—a very desirable and pleasing feature. This open arcade stops against the extreme wings and the two central day-room octagons," &c. Now he has here mixed up the "corridor of communication" and the verandah, which are distinct things. The former is in front towards the road, but the latter is towards the garden, and forms the "arcaded balcony on the stone arcade" your critic is kind enough to consider so pleasing. The corridor in front is the general means of communication between the wards, day-rooms, &c., while the verandah, or arcaded balcony, towards the garden, comes between the extreme wings and the central staircase, having the windows of the wards opening out upon it. Thus you will observe the functions of the two are very different.

Your critic strikes the key-note of the question in his concluding remarks when he points out the difference between this building and a general hospital. The pavilion principle with windows on each side, is not so applicable to the requirements of consumptive cases, where cross draughts and too much light in the wards are considered disadvantages. Hence the difference in construction between the wards in this instance and those for a general hospital.—I am, &c.,

THE AUTHOR OF THE DESIGN
SIGNED "HAMPSTEAD."

London, 12th September, 1877.

FORCE OF WIND.

SIR,—A correspondent who signs the initials "J.S." alludes to the investigations on the force of the wind made by Hutton, whose empirical formula is worked out in Unwin's lectures on "Bridges and Roofs." This formula of Hutton's was deduced by him from experiments on the motion of a small plane through the air, the plane being inclined at various angles to the direction of motion, and it is assumed that the pressure on the plane will be the same if the air itself is in motion and the plane at rest, as when the plane is in motion and the air is at rest. Whether this assumption is correct or not remains to be proved. The formula, however, as worked out by Mr. Unwin, contradicts itself, for on the supposition that the wind blows horizontally against a roof, it gives the normal pressure per foot on a roof of 60° pitch as the same as that on a perpendicular wall, against which, of course, the wind would have its maximum effect. (By working out the formula the angle will be found to be more nearly 57°, instead of 60°.) And what is still more extraordinary, when the pitch is 70° the normal pressure per foot is actually greater than that on a vertical wall—that is, greater than the maximum. These anomalies destroy all confidence in the formula, and it is surprising that so good a mathematician as Mr. Unwin should have adopted it without noticing the failure.—I am, &c.,

THE AUTHOR OF THE ARTICLE.

THE CHAPEL ROYAL, SAVOY.

SIR,—During the last week remarks have been made by most of the daily and weekly papers in reference to the alterations about to be carried out in the above building, and as some fears have been expressed lest the ancient character of the edifice should be injured, we have thought it right, as architects to her Majesty for the works, to inform you explicitly what their nature is.

The existing vestry, which dates back only some five and twenty years, and which besides being too confined for the necessities of the choir is defective in its sanitary arrangements, will be removed. In place of it, and on the same site, will be erected a new vestry more in accordance with the character of the chapel, and in no way interfering with the view of the east elevation. A new small door-way is to be cut through the east wall by the pulpit, not, as stated by one paper, to be an entrance solely for the Chancellor's use, but chiefly to form what is so much needed at the north end—a vomitorium for the congregation in case of fire. Before this door will be a porch which will also give access to the new vestry.

These are the only works now definitely arranged for, as the scheme for raising the organ into a loft at the south end, and forming doors in the south wall towards the Embankment, in place of the present modern east door, is postponed for further consideration.—We are, &c.,

PERRY AND REED,
9, John-st., Adelphi, Architects to her Majesty's
Sept. 11, 1877. Chapel Royal in the Savoy.

A CORRECTION.

SIR,—May I request that in your next issue you will make a little correction? The paper on "Corwen Church," read at the British Archaeological Congress, was not the production of the Rev. William Richardson (who kindly read it in my absence), but was written by yours faithfully,

EDMUND B. FERREY,
15, Spring-gardeau, S.W., Sept. 8th, 1877.

CHIPS

The parish church of Bolton-upon-Swale has been improved by the erection of a new organ chamber and the re-flooring of the chancel. Mr. W. E. Nessfield, of London, was the architect. A stained glass window has also been inserted from the studio of Messrs. Heaton, Butler, and Bogue. The subject is the three Maries.

The pile of buildings in course of erection by the Bradford Corporation, in connection with the covered market, is approaching completion. The architects are Messrs. Lockwood and Mawson. At the meeting of the Town Council, on Tuesday, it was recommended that tenders amounting in the aggregate to £3,554 15s. be accepted for the execution of the works required to be done to complete the interior of the market.

The Handsworth Local Board of Health have appointed Mr. E. Kenworthy, late borough surveyor of Barnsley, as their engineer and surveyor.

The Ashton-in-Makerfield Local Board of Health have been discussing the present condition of the streets, and who ought to contribute towards their improvement. In some parts of the district the roads have fallen in 15 or 16ft. through the subsidence of the mine roofs beneath, and it was suggested that the colliery owners ought to be called upon to pay for the repairs and makings good. Ultimately this proposal was defeated.

The apse of the parish church of Wiveliscombe has been decorated by Mr. W. Berryman and Messrs. T. and S. Richards.

A large block of business premises is being erected in the main street of Briton Ferry, from plans by Mr. H. F. Clarke, by Mr. Isaac George, builder.

Pyle Church, near Bridgend, was re-opened yesterday (Thursday) after restoration.

A curious accident is reported from Horwich, near Bolton. Some drainage operations were being carried out at the rear of a new chapel, and on the night of Wednesday week the end wall "caved" in upon the pulpit and communion table, destroying a stained glass window, as well as much of the internal fittings of the chapel.

New water supply works are being carried out at Lilanely. Mr. E. H. Douglas is the engineer.

At Bournemouth cemetery, on Thursday week, the foundation stones of two chapels were laid. Mr. C. C. Creeke is the architect, and Mr. S. Clarke the builder. The cost will be about £3,000. The contract for laying out the cemetery grounds has been taken by Mr. Charles Strickland.

Mr. J. C. Rees, contractor, of Neath and Swansea, gave an outing to his employes last week, Resolven being the place visited by the party, who numbered over 400.

The tender of Mr. Carruthers, of Reigate, amounting to £9,218, has been accepted for the erection of the new Church of All Saints, Eastbourne, and the building committee have made arrangements to proceed at once with a first contract of £6,935 for the fabric.

Intercommunication.

QUESTIONS.

[5119].—Saw Mills, &c.—Will some reader inform me if any good works are published which treat upon the general arrangement of machinery suitable for a saw-mill and builders' works?—X. F.

[5120].—Joiner Work.—Will any of your readers, with a practical knowledge of joiner work, kindly inform me if the following idea is practicable, and if not, point out its defects:—To take a panel, say, of yellow pine, or other light wood, and cover it with a dark veneering, such as mahogany or rosewood, with an ornamental figure cut out, as on a stencil plate. In a case where the ornament was of a simple form the veneer could be sunk flush with the face of the lighter wood. This would give the effect of inlaid work without the extra labour, trouble, and, consequently, expense which inlaying involves. Would the pressing out of the glue, or any other obstacle I have overlooked, render this idea practicable?—VENEERING.

[5121].—Purification of Sewage.—Will any of your engineering subscribers inform me if the Local Government Board have recently approved of any drainage scheme which proposes to deal with the sewage by precipitation only, and if so, what process was proposed, or do they only sanction precipitation when combined with irrigation or intermittent downward filtration?—S.I.C.E.

[5122].—Plaster Casts.—Will some one kindly describe the best method of taking casts from living models (say, a hand and forearm)? How is the model released from the mould? Is there anything better than plaster for the purpose? Are there any descriptions of the process published? Any information on the subject will greatly oblige.—W.

[5123].—Plate Glass.—Would any of your readers kindly inform me the best method of fixing plate glass into stone mullions? Should there be a metal or wooden groove inserted in the stone?—SMOCK.

[5124].—Strength of Arch.—I have two walls forming a passage with a barrelled arch over, formed with three courses of plain tiles in cement, filled in with Portland cement concrete up to the crown level; distance between walls, 7ft.; rise of arch, 4in. I wish to build a furnace on this arch. One side will be against the wall, perpendicular above, the wall below extending about 4ft. out from the wall, and 5ft. parallel to the wall. What is the weight I can safely put on this space?—C. E. E.

[5125].—Fitch Girder.—I want to make two large rooms into one, and for convenience I want to insert a fitch girder with a piece of timber on each side; distance between supports, 22ft.; distributed weight, over 15 tons. What sized fitch and timbers shall I require?—C. E. E.

REPLIES.

[5110].—Separating Fine Sand from Water.—The attempt to separate the sand by subsidence, as suggested by "Aqua," on p. 245, entirely fails; the least movement in the water carries the sand with the water. The following is in operation, but does not answer. [Our correspondent here sends a sketch showing the pipe from spring entering a kind of salmon-ladder, with partitions alternately placed so as to screen the sand before entering reservoir.] The attempt to further separate by means of charcoal and felt in the compartments of filter is soon rendered inoperative by the sand clogging up the filtering medium. Further aid in the matter is solicited by—X. Y. Z.

[5111].—Turkish Baths.—Floor of warm rooms may be laid with encaustic tiles or concrete bed, which I have laid on pugging between ordinary joists. The floor of hot rooms, as a rule, is too hot for bare feet, and has to be covered with a drugget, or other carpet. In these rooms it is sufficient to lay the same concrete bed as before, and finish off with coat of cement. For ceilings I used large ceiling lights on the flat, filled in with double sheets of glass, one of which is hand-pointed, the ceilings round the lights being three-coat plaster on laths, rather stronger than usual. Ventilators in ceilings let out surplus hot air into cock loft over, roof over which is one-half rough plate glass. For heating I prefer Constantine's stove, fed by fresh air from outside, and admitted into rooms through movable gratings, or air-brick let into dwarf-glazed brick walls, supporting stone seats round warm and hot rooms. In some cases it is found sufficient to allow the hot air to enter direct into the hot room by a grating, say, 3ft. by 2ft., immediately over the stove. In that case the warm rooms are heated by the hot air escaping through the doorways, and other openings, into the warm rooms; but the former method is preferable, as equalising the temperature better.—HOWARD EVANS.

[5116].—Measuring and Sketching.—In the BUILDING NEWS of May 30, June 10, and 13, 1862, was published a paper of mine on a visit to Normandy, which will supply the information asked for.—R. PHENE SPIERS.

[5117].—Mortar.—I believe that hydraulic lime should be slaked as soon as possible after being brought from the kiln, and the admixture, with the sand made as quickly as circumstances will admit.

To slake the lime, and then leave it to the action of the atmosphere, must, in my opinion, impair the cementing property of the mortar when mixed, simply because the lime is, during the interval, re-absorbing the carbonic acid from the atmosphere, and losing thereby its essential qualities. It is a workman's idea, but a correct one, that lime is killed by time. I should for the same reason prefer to use the mortar as soon as mixed. I may here say "Vicat" recommends slow-slaking limes to be reduced to a powder before they are worked into mortar—that an imperfect slaking be commenced, but other authorities—Treußart, for example—show that the absorption of carbonic acid gas thus induced destroys the concreting action of the lime, and he asserts that all hydraulic limes should be used fresh from the kiln.—G. H. G.

CHIPS.

A new south aisle is in course of erection at St. Mary-le-Wigford church, Lincoln. Mr. R. Young, of Lincoln, is the builder, and his contract is £610, exclusive of gas and heating apparatus. The church was only recently thoroughly restored at a cost of £1,500. Messrs. Clarke and Son, of Nottingham, are architects for both the restoration and south aisle, now in course of erection.

A reredos of Bath stone has been recently completed for the St. John's Church, Carlisle. It has three central gables crocketed and finialed with the passion flower, vine, and wheat carved in medallions. The sides are arcaded with detached columns, carved caps, and bases. The work was executed by Mr. Nelson, Carlisle, from the designs of Messrs. Clarke and Son, architects, Nottingham, who also designed the church, which is a large and handsome structure, in the Early English style.

Messrs. Robert Clarke and Son, architects, of Nottingham, were appointed architects to the Carlton School Board at a meeting held on the 19th of July.

The foundation stone of a new Wesleyan chapel was laid at Thornley, near Darlington, on Saturday. The building is a Gothic one of freestone, with faced dressings, measuring 36ft. by 25ft. It is to have an internal gallery, and will cost £240. Mr. John Hutchinson is the mason, and Messrs. Rowe and Jones are the joiners.

Mr. and Mrs. P. C. D. Boswell, of Auchinleck, N.B., were presented last week with their portraits. The paintings had been executed in oil by a native of the parish, Mr. W. H. Johnstone, of Manchester.

Mr. Orden, engineering inspector to the London and North-Western Railway Company, died on Sunday week in consequence of a fracture of the skull, caused by a fall from the girder of a new bridge at Roade, the erection of which he was superintending.

The Priory Pro-Cathedral of Belmont, near Hereford, is about to be enlarged according to the original design of the late Edward Welby Pugin. The dwarf lantern tower will be replaced by a lofty spire, and a mortuary chapel is to be erected as the family sepulchre of Mr. F. Wegg-Prosser, by whom the lavish expenditure already incurred has been laid out.

The Bridgend Board of Health on Friday decided to call in "some eminent engineer" to advise them as to the best means of preventing future floods.

The Brussels Museum has acquired an important painting by Gallait—"The Taking of Antioch." It has been bought by the Government for 20,000f.

Among the uses of a cemetery that of a grape-pressing establishment is one of the latest. At a meeting of the Luton Cemetery Company on Friday, it was reported that as the viney in the grounds had considerably increased the finances, Mr. J. R. Brown had been requested to prepare plans and invite tenders for a second building of the kind. The architect's tender was £295, and the tenders ranged from £297 to £400. The lowest tender was accepted.

The fifth annual exhibition of pictures by living artists, in connection with the Brighton Public Museum, Library, and Picture Gallery, was opened last week. The collection is a larger one than in former years, including between 800 and 900 pictures, in which oil paintings and water colours are about equally represented.

The foundation stone of the new Church of the Holy Rood was laid at Crofton, Hants, on the 30th ult. The church will be Early English in style, will be built of flint, with Bath dressings, and will cost when completed about £6,000.

The church of St. Thomas-à-Becket, Lewes, has just been lighted with gas, with the exception of the chancel, for the reseating and refitting of which plans are being prepared by Mr. Philip E. Currey.

The Town Council of Brighton are about to expend £12,000 on street improvements in the neighbourhood of the Marine-parade, to be effected by the purchase of the East Lodge Estate.

At Sheffield, on Tuesday, a quarryman, named Henry Bevor, was fined 40s. and 21s. 6d. costs, or in default ordered to be imprisoned for two months, for a violent and unprovoked assault on William Fortescue, foreman mason. Fortescue came with a number of masons from the East Riding to build a new church at Deepcar on contract terms, and much unpleasantness arose with the resident workmen, who accused them of being "blacklegs."

LEGAL INTELLIGENCE.

THE EMPLOYERS AND WORKMEN'S ACT.—Alfred Taylor, builder, of 265, Cambridge-road, Bethnal-green, appeared on Saturday at the Woolwich Police-court in answer to 22 summonses for arrears of wages taken out against him by bricklayers, carpenters, and labourers lately in his employ on the works of a new factory in course of erection at Charlton.—Mr. Douhle, the foreman of the works, was called, and said that his employer, the defendant, had a contract from the principal, Mr. Chambers. The workmen were all paid their wages up to Saturday, the 11th of August, and they worked the following week as usual. On Tuesday, the 14th, Mr. Chambers gave Mr. Taylor written notice to give up possession of the works; but Mr. Taylor said he should take no heed of it, and told witness to keep the men at work, as he had sufficient to pay them. On the Thursday afternoon he sent a telegram, which said, "Tell the men they must look to Chambers for the money; he has taken everything."—In cross-examination he said he was not aware of the arrangements between Mr. Chambers and Mr. Taylor, but the latter always engaged the men. Witness was now in the service of Mr. Chambers.—Mr. Safford contended that Mr. Taylor was simply the agent of Mr. Chambers, and therefore not liable, and that, at all events, if he had any liability, it ceased on the Tuesday, when Mr. Chambers took formal possession.—Mr. Slade, after a lengthened inquiry, gave judgment in favour of the plaintiffs, with costs.

NEGLECTING TO DEPOSIT PLANS.—John Child Meredith, Bordesley Green, Birmingham, was summoned last week for that he, being a person intending to make and lay out a certain new street, did not give notice to the Town Council, and did not submit to the surveyor of the borough a plan and section of the street. It was stated that the defendant had laid out a street known as Walter-street, situated between Long Acre and Thimble Mill-lane, and that no plan had been submitted so that the authorities might be made acquainted with the extent and level of the thoroughfare, as required by bye-law 71. The defendant was therefore liable to a penalty of £5. Mr. Norrington, the surveyor of buildings to the borough, had approved the plans of several buildings erected in the street, being unaware at the time that the street itself was not duly authorised.—Defendant urged that he had nothing to do with the submitting of a plan, he not being the freeholder of the land. The street was surveyed and allotted 20 years ago. He thought the authorities were persecuting him, and that "it was all a high-handed piece of humbuggery."—The magistrates reprimanded the defendant for his injudicious remarks, and Mr. Osborne said defendant was bound to prepare a plan and submit it to the Corporation.—Defendant urged that he had done the borough hundreds of pounds' worth of good, and he ought not to be afflicted in that manner.—The case was ultimately adjourned for a month, defendant, who was very excited, agreeing to submit a plan in the meantime.

STATUES, MEMORIALS, &c.

KILMARNOCK.—The subscribers to the proposed Burns memorial at Kilmarnock, have agreed to erect an ornamental building in the proposed public park, with one or two rooms for a museum of Burns relics, &c., and a marble statue of the poet in the niche inside. The estimated cost of the building—for which a design by Mr. R. S. Ingram, architect, has been accepted—is £1,500, and the cost of the statue is estimated at £300. Open competition by model for the statue is agreed to, and two premiums are offered—one for £50 and one for £25—to be awarded for the models next in order of merit to that selected.

On the occasion of the opening of the new hall at Blair Castle, N.B., the other day, the Duke of Atholl was presented with a portrait of himself, painted by Mr. Barclay, of Edinburgh.

Mr. W. H. Taylor, builder, of Ilminster, entertained his workpeople at supper on Saturday evening, in celebration of the opening of new workshops.

The Hull Dock Company have determined to construct a graving dock on the east foreshore of the river Hummer, of sufficient dimensions to accommodate the largest class of ships, and provided with every modern appliance for speedy accomplishment of repairs, docking, &c.

Under date of 8th August, Messrs. J. C. Thompson and Co. write from Buenos Ayres:—"Chubb's safe, No. 1,670, No. 20 size, belonging to E. M. Powell and Co., was attempted to be opened a few days since. The burglars succeeded in boring a centre hole to work the bit upon, and almost cut through the outer plate. Not being able to complete this, they seem to have attempted to force the piece out, about 6in. in diameter, but in this they also failed. The safe is a very old one, and the plate about half the thickness of those at present supplied."

Our Office Table.

THE Sheffield Corporation has this week taken a commendable step in the direction of reducing, to a very small extent, it is true, the unsightliness of that smoke-begrimed centre of industry. An agreement has just been concluded between the Vicar of Sheffield and the Corporation whereby two strips of land off the old parish churchyard, containing 657 and 312 square yards respectively, will be thrown into Church-street and Campo-lane, for the widening of those thoroughfares; and, in recompense, the Corporation will construct a dwarf wall and ornamental iron railing round the whole churchyard, and erect entrances, and lay out and maintain the area as an ornamental garden, with free access to the public during hours to be prescribed by the corporate authority. The churchyards recently laid out in London, together with Leicester and Parliament squares, are specified as models of the kind of laying-out and improvement to be adopted.

WE see in the list of tenders in our present impression the highest tender for sewers for the vestry of St. Leonard, Shoreditch, was £7,621. This was submitted by Mr. Coker; and the lowest, which was submitted by Mr. Josh. Rendall, £3,166, was accepted. There must be loose calculation somewhere. Judging from the bulk of the other tenders sent in, we should say that both Mr. Coker and Mr. Rendall were somewhat mistaken.

WATER SUPPLY AND SANITARY MATTERS.

RUTHERGLEN.—The town council of this burgh are dissatisfied with the water supply which they now receive from the Glasgow Water Commissioners, deeming it inadequate. Their remonstrances have hitherto been met with promises of a better supply as soon as the commissioners have completed certain works in progress. On Monday evening the Rutherglen Council received reports from Dr. Wallace, the burgh analyst, upon samples submitted to him from the Earn, Thriepland, Calder and White Cart waters respectively, in which he pronounced very decidedly in favour of the first-named, which, after filtration, would, he considered, be quite suitable for domestic use. A committee reported on the feasibility of getting water from the Earn river, and it was also stated that the supply is sufficient to furnish 10,000,000 gallons, daily, equal to an ample supply for fifteen or sixteen times the present population of Rutherglen. A motion was thereupon proposed, appointing Professor James Thomson, of Glasgow University, to report on the probable cost of bringing a supply of the Earn water to Rutherglen, but the majority of the board decided, before taking this step, that the clerk to the Glasgow Water Commissioners be again communicated with and asked whether the commissioners are able to promise an adequate supply, how they propose doing so, and when it will be put into operation.

WINCHESTER.—The town council is about to carry out an extensive sewerage scheme from the plans of Mr. James G. Lemon, C.E. The provisional order has been duly confirmed by Parliament; permission to borrow from the Public Works Loan Commissioners the sum of £32,500 has been obtained, and tenders for cast-iron pumping-mains, socket-pipes, &c. The works will be commenced within the next fortnight.

A new purifying chamber is being added to Messrs. Vivian and Son's acid works at Taibach, near Cardiff. On Wednesday some workmen tried to hoist a roll of lead weighing 21cwt. to the roof, when the scaffolding broke under the strain, and four of the men were seriously injured.

The foundation stone of a new United Presbyterian church at Wick was laid on Tuesday. The church, which is being erected from designs by Mr. W. Macintosh, architect, Inverness, will accommodate 700 sitters. It is to cost £4,000.

On Saturday the corner stone of a new chapel and school, belonging to the United Methodist Free Church, were laid at Lumbutts, near Todmorden. The style will be Gothic, from designs by J. Horsfall, architect, Todmorden. The cost will be about £1,200.

Some premises, consisting of 18, The Crescent, Birmingham, have been adapted for the Birmingham Secular Club and Institute, under the superintendence of Messrs. Foulkes and Ryland, architects, of that town.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPT. 21, 1877.

TWO GREAT BUILDINGS—A CONTRAST.

TWO great buildings, in representative styles, have been opened to the public during the last few days. Manchester, the great cotton metropolis, has just completed a Town Hall worthy alike of its industry, and of its municipal importance, in a style of architecture that may be fairly characterised as the most modern adaptation of Gothic we yet possess; while Liverpool, the great seaport of Lancashire, has recently opened a building, to be devoted to the fine arts, in a style true to her traditions. Both these buildings have been fully illustrated and described in our pages—the former in our last volume, and the latter in our issue of the 7th inst.; and we therefore need not describe them here, though we may somewhat profitably take the two buildings as the text of some reflections on the duality of our architectural taste. In two of the greatest towns of Lancashire—we may say of the provinces—we are thus brought face to face with extreme schools of architecture, though each the work of representative men in their profession. The Gothic Town Hall, opened last week, is the greatest work, probably, of its well-known architect, as it may certainly be considered one of the most typical structures of the present age. It stands to the present generation much in the same relation as the Liverpool Town Hall did at the time of its erection. In Mr. Waterhouse's building, as in that of Mr. Lonsdale Elmes', we are impressed by the adaptation of the two opposite modes of building to essentially modern requirements; each is the work of a master in planning and design, and each the development of the commercial spirit of the age as manifested in one of our largest manufacturing districts. In the work of Mr. Waterhouse we see a traditional style worked out with an independence unknown in any previous attempt. It is thoroughly Gothic, but it has a stamp of modernism upon it that we cannot mistake for the obsolete mediævalism of another school. Though somewhat hard, and rather mechanical in its lines and details, its Gothic or rather its style is *thorough*; there is no flimsy superficiality of feature, as we see in a dozen other town halls in the Gothic style. Whatever character we may attribute to Mr. Waterhouse's Gothic, it has certainly the genuineness of a *worked-out expression*, and we fail to detect the *disjuncta membra* of an indiscriminate eclecticism. But the greatest of the merits for which posterity will admire the Manchester Town Hall, and upon which it must be judged, is, that the design is the development of a plan. It unquestionably ranks as one of the most masterly examples of modern planning. The irregular triangle of ground the architect had to deal with has been most skilfully disposed of in the mode of internal communication adopted; the positions of the entrances are those dictated by a consideration of the business quarters and localities of particular departments of a vast municipal organisation; the centre and angle staircases have been planned with consummate skill for the due communication between separate portions of the building, connected by a continuous groined corridor; the oriels and courtyards have been disposed with the greatest foresight to give light, and contribute at the same time to the interior piquancy of the architecture: while in many instances the architect has created quite a *coup d'œil*. In short, the plan may be regarded as the structural crystallisation

of the complex municipality of one of our largest cities. A method appears conspicuous in the arrangement of the various departments of corporation business. The police, water, gas, legal and surveying departments, &c., have been made separate functions, yet subordinated to the whole. As the author of "Faust" has said, "every living being is not a unity but a plurality." So, in such a complex structure as a town hall, we have a plurality of offices combined in one organic whole. The same great author, when he said in his celebrated treatise on biological laws that "subordination of parts indicates high grade of organisation," while the more imperfect the organism the more its individual parts resemble each other, declared a doctrine that has not only been accepted by every zoologist, but which admirably suggests itself to the inventor of a great and complex building. The division of labour in the animal organism hinted by Goethe has always seemed to us to be the principle the architect should keep in view in designing a complex structure. The more perfect the structure the more its parts should be subordinated. In the lowest type of animals we find on division each part will live and manifest the same functions which the whole does, but as we advance in the scale of organism the parts have dissimilar functions. Now, in every great building designed to meet various conditions, we meet the same law. Its type is necessarily different from that of such a building as a heathen temple; its parts are necessarily dissimilar and subordinated. It is rather flattering to the architect of the Manchester Town Hall to say that his great work conforms to this law. There is rhythm and balance in the external features of the main fronts, but the parts are duly subordinated. Thus, in the main façade towards Albert-square, which is 328ft. long, we have the central tower balancing the whole, but performing an important office in the structure—it is the main public entrance. Examining the wings, we observe that there are differences, though in a general glance they appear symmetrical. The projecting ends are dissimilar, both in the general features and detail, while the other fronts show diversity in fenestration. Again, vertically, we note a subordination of parts which express the internal functions. The lofty first-floor windows are wider spaced in the front than the tiers of ground floor and second floor. The longer frontages indicate in like manner the difference of use. We, in fact, could hardly conceive a building in a Classical style that would so admirably suit the site as the one erected. A triangular Classic structure would have been out of place, if not out of character, and we can only point to Sir W. Tite's Royal Exchange as a building that has shown the possibility in, at least, an unoffending degree. The architect of the Manchester Town Hall has worked on the true method of the Gothic and Renaissance architects. Symmetry and balance have not been recklessly disregarded by a collocation of a jumble of forms, but there is that diversity which the complexity of internal arrangement demanded. As an instance, at least, of the principle followed by the ancients and Gothicists—namely, that of making the dissimilar portions of a building crystallise, so to speak, into external forms, exhibiting the attributes of unity and variety—we have few modern instances that can equal it.

Turning to the Liverpool Art Gallery, the plan of which we have illustrated, it is evident another principle actuated the architect. Mr. Sherlock had certain picture galleries to arrange on a site not so restricted as to form. They could have been arranged various ways—in a row, in a quadrangular, or hollow rectangular form; and we find the architect has accordingly

availed himself of an axial distribution of his apartments. He makes a central hall and stairs the grand entrance and feature, flanking which, and slightly receding from it, are extended the picture galleries as similar units. There was no apparent reason to make one gallery larger than the other. There was no special entrance required to each. Accordingly one centre portico entrance becomes the proper and most economical arrangement, and the galleries are made subordinate and contributory to it externally. We look upon the Walker Art Gallery as much of a success architecturally as the Manchester Town Hall. Each, we consider, illustrates a grand principle of architectural design. The Liverpool Art Gallery was as essentially a simple as the Town Hall was a complex structure. Each demanded a different method of arrangement. The parts of the former are few, perform like functions, and are similar; and it would have been as useless a waste of money to have given it a Gothic form, as it would have been absurd to place the varied departments of the Manchester Corporation into a homologous case. Externally, we find the architect has adopted, for this reason, primarily, a Greek style; the wings are treated as plain pierced walls, relieved by a deep frieze panel—the only consistent treatment that could have been adopted, and resembling much the Glyptothek at Munich; they harmonise well with the centre portico, while the rusticated basement and horizontal mouldings connect the parts. There is a classic simplicity evident—no straining after effect, and the result may fairly compare with St. George's Hall itself. The outline is severe, the parts few, and the detail pure. Mr. Fergusson compares Mr. Elmes' great work indeed to a mediæval cathedral. This structure is composed of one great hall and two end courts arranged on a central axis, and flanked on both sides by porticoes of one order. We have nothing equal to it as a modern adaptation of the Classical style. The grand hall is marked externally, and pronounced by the great portico of sixteen columns. There is a gloomy heaviness about the building, but we know of no other modern classical Greek structure that is so appropriate to its use. But the secret of the grandeur of this great hall is the fact that its architect foresaw the principle, and applied the method we have just considered, and the result is a composition universally admired for its very femness of parts, its purity of detail, and grandeur of effect. It is satisfactory to find that the architect of the new Art Gallery has not lost sight of the principle, but has successfully applied it in a structure in the immediate neighbourhood of the great hall. The importance, architecturally, of the two buildings is a sufficient apology for our thus calling attention to them as illustrating in a remarkable manner the two opposite rules of architectural composition. English architecture has at least been fortunate in being represented by two buildings by masters of opposing schools of design, who have had the skill in both cases to apply the methods most adapted to their peculiar purposes. It is more remarkable to notice that the fashionable styles of the day have been set aside in these two typical structures.

SHAM FRONTS AND COMBUSTIBLE INTERIORS.

IN spite of the Metropolitan Building Act, and the precautionary legislation introduced to insure the safety of buildings against fire, it is somewhat remarkable that we should be threatened with a class of structure that may be fairly called "combustible shells." These buildings generally take the form of warehouses, though not

unfrequently they go under the somewhat ambiguous term of "business premises," or offices. In all but their names they are nothing more nor less than huge cases of brick walls, containing from five to six floors of timber joists, and divided into compartments of various areas by flimsy match-boarded partitions that readily admit of being shifted or varied to meet the exigencies of precarious lettings. The often purposeless character of these metropolitan buildings renders it almost necessary to construct them in the manner described, as they can thus be let in portions or floors, let out as warehouses or show-rooms, or turned into sets of chambers or private offices, to the best advantage. These huge structures or cases of brick frequently usurp the position of several houses in narrow streets, obstruct the light and air of opposite and neighbouring houses, and, worse than all, inflict upon them the risk of fire inseparable from their proximity to such structures. Referring to the Building Act, certain rules are to be observed as regards the separation of buildings and the limitation of their areas; but it certainly seems that the very complexity of the conditions of building in London, and the rival and conflicting rules of the Metropolitan Board, have nullified some of these most necessary regulations for safety. Let us briefly refer to the rules as given in the Act. We have it laid down that every building shall be "separated by external or party walls from any adjoining building;" secondly, that "separate sets of chambers or rooms tenanted by different persons shall, if contained in a building exceeding 3,600 square feet in area, be deemed to be separate buildings, and be divided accordingly, so far as they adjoin vertically, by party-walls, and so far as they adjoin horizontally by party arches or fireproof floors." Again, Rule 4 says:—"Every warehouse or other building, used either wholly or in part for the purpose of trade or manufacture, containing more than 216,000 cubic feet, shall be divided by party walls in such manner that the contents of each division thereof shall not exceed the above-mentioned number of cubic feet." Now, we can point to several instances where these conditions have either been frustrated or openly ignored. We contend that the second rule quoted above is contravened in every essential point in buildings of the kind we have named, and there cannot be a doubt that the Building Act is seriously defective in this matter. What is there to prevent the owner of any large warehouse from letting his floors as "separate sets of chambers," divided by inflammable match boardings? and is it not equally dangerous for a building containing a less superficial area than the 3,600ft.—say 1ft. less, to evade the letter of the Act—to be divided into separate compartments by thin boarded partitions? Why should an arbitrary area determine whether a warehouse shall be divided by party-walls or not? But there is a double danger in these large brick enclosures of inflammable interiors. If a fire were to break out, the whole interior in a few minutes would be in a blaze; in fact we should have a roaring furnace of combustible materials. Not only the vertical partitions are of wood, but the floors are constructed of the same material, without the slightest provision against fire. We have as we write a building in Tavistock-street before us. It presents an extensive red brick frontage five stories in height, towering considerably above the adjoining houses, and perforated by large three-light windows. This, with the side party-walls and the exterior back wall, encloses an area of about 3,000ft., and to all appearances from the outside one would imagine that a very substantial, if we cannot call it architectural, structure

has been erected. But if the observer had taken the trouble to watch the progress of this building, he would have seen as the walls gradually rose huge timber joist floors inserted at intervals covering the entire area. Story after story the outer walls are raised, and the floors constructed, but there is no sign of any cross walls, except a perforated centre wall; the eye can see through the whole like a great empty cage, and the ordinary observer would come to the conclusion that the purpose of the building was that of a warehouse, though he would certainly never imagine that such a large wooden interior could be designed within the jurisdiction of the Metropolitan Act. In a few weeks this timber scaffolding—if we may so call it—is covered up by thin boarding; no concrete, cement, or plaster is used to fill in the spaces or to form the ceilings; and in a short time we are surprised to find that an inner house of wooden partitions is created, regardless of the front wall, with its large gaping and unmeaning windows, and without the slightest reference to them. The observer, who before in all faith, believed his eyes, and saw great warehouse floors, may now be surprised and unable to realise the intentions of the building which imposes a front of such sham magnificence on the public. Such is an ordinary instance of the constructive hypocrisy found to exist under the Building Act. Here the tenants of a residential street have a large wooden structure thrust close to their doors, concealed from view by four brick walls, two of which are perforated with openings and erected of a prescribed thickness. Inside of them are two (?) wooden structures, five stories in height, with timber floors, and partitions covered with thin boarding, but their areas happen to be within the arbitrary limit of the Act, and they are pronounced safe. To such an absurdity does our present Building Act lead us. In the "Model Bye Laws," issued by the Local Government Board, it is prescribed that every cross wall shall be of "good bricks or suitable stone, or other blocks of hard and incombustible substance," but we fail to find any general rule bearing upon the question of inside partitions, in respect of the division of the building, or the purpose it is intended for. It seems unreasonable that warehouses of whatever area should have partitions of wood; such a risk ought to be impossible, and especially in a crowded residential neighbourhood. One of the new "model bye-laws" provides that every person who erects a new building shall cause the "open space inside any partition wall of such building, or between the joists in any wall of such building, to be stopped with brick-work, concrete, pugging, or other incombustible material at every floor and ceiling." Now in the building we have referred to, the spaces between the joists are left open, while every ceiling is match-boarded with thin stuff that could not resist a gas-light for a minute, but would instantly ignite, like so much tinder, and extend the destruction through every floor. Plaster ceilings are more resistant, and every timber floor, of a warehouse especially, should be filled in with pugging or concrete, as solid floors and partitions are much less inflammable than hollow ones, though builders are a long time in becoming acquainted with the fact. If we were to select the most combustible of all floors or partitions it would certainly be one constructed with wooden joists, covered on both sides with boards, such as we see them in some of these warehouses, or sham dwelling-houses incased in brick walls. It is time, indeed, some corrective was applied to this deceptive kind of building, if only in the interests of tenants and leaseholders. Why should a whole street—aye, neighbourhood—be endangered by the existence in its midst of a structure that,

professedly ranking as a warehouse, is infinitely more dangerous than any of the other houses, and can contravene the aim of the Act by the violation of those very rules that have been framed to give security against fire? We consider this question to be one which an amended Building Act must deal with. It is an anomaly that seriously impairs the security of buildings in the metropolis. We have considered only a typical case; there are hundreds of such buildings being erected in London at the present time. Ornamental fronts of brick and stone are run up, and the interiors are filled up afterwards, and one sees rarely anything but joists and quarters. If we could imagine the fronts of some of our main thoroughfares removed, or the front walls taken away, it is to be feared there would be little to choose between London and New York; we could scarcely hold the candle to either as regards solidity and incombustibility.

The various and conflicting interpretations of metropolitan magistrates, upon questions of party-walls, chimneys, and other details of the Building Act, have been prolific in creating a doubtful construction of many clauses, and there can be but one opinion, that an entire reconstruction of the rules are required. Who would have ever thought that the London building regulations, as they exist, say nothing about the necessity of a healthy and unpolluted site; nothing about concrete, or a "damp-proof" course; do not touch the sanitary requirements that are now universally admitted as necessities—such, for example, as that no drains are to pass underneath any building, and that they should be disconnected from the sewers. Such omissions are sufficiently condemnatory of themselves; and it is satisfactory to find the model bye-laws of the Local Government Board have done something towards supplying the deficiencies. By the way, we find that the bye-laws make a two-fold distinction in the definition of "party-wall" for the purpose of getting over the difficulties that have been experienced by the profession, and builders generally, in London. Under the new definitions a "party-wall" is considered either as a separating wall between two adjoining buildings, or a wall "forming part of a building, and standing in any part of the length of such wall to a greater extent than the projection of the footings on one side, on grounds of different owners." This definition, to our minds, is scarcely so clear as it should be, though the aim is to make the party-wall a structure entirely independent of any tampering on the part of either owner, and quite distinct from an "external wall." We think we can discern, moreover, future disagreements as to what constitutes a party or an external wall, as long as adjoining owners exist.

A FEW WORDS ON ROOF TRUSSES.

ARCHITECTS are constantly employing roof trusses, but few ever take the trouble to test the fitness and strength of forms that are now traditional, and whose mechanical capabilities are beyond doubt. Though Tredgold has written ably on these structures, he has not gone beyond the ordinary king and queen-post roofs of his day, omitting all reference to the numerous kinds of roofs that are without tie-beams, such as the old Gothic forms of collar and hammer-beam constructions, so continually used in our own time. Other writers, as Rankine, and Bow in his "Economics of Construction," have alluded to them, and shown the principle of finding the strains in the different members; but they have given very few examples adapted for architects' purposes. In Mr. Hatfield's work on "Transverse Strains," recently reviewed by us, a considerable chapter is devoted to the

subject, and examples illustrating various principles are given. Mr. Hatfield gives some useful advice to designers of roofs; and one or two recommendations strike us as sufficiently important to refer to them. One of these is the location of the trusses upon the solid portions of the walls. As a rule, architects know that the best position is centrally over the piers or wall spaces, between the windows, when this position can be insured without much trouble or inconvenience. The windows in this case generally determine the number of the trusses and their distances apart. From 10ft. to 15ft. seems to be the recognised rule for distance in buildings of ordinary kind, and greater distances require heavier timbers to carry the increased roofing in purlins and rafters. In planning buildings the architect has, therefore, to keep an eye to the piers for his trusses; but in many cases we have found the subject of roofing has been totally absent from his mind, and that he has only paid attention to his windows and doorways. No doubt those immediate wants of the building require primary thought, and in some cases the necessities of the plan may even be allowed to become the paramount consideration. In designs for churches and schools we have constantly observed the difficulty the author has experienced in spacing his solids and voids, particularly when a porch or organ-chamber has disturbed the symmetry of the arrangement. In these cases it is almost unavoidable that one or more of the trusses should be placed over windows—a condition never satisfactory in either a structural or architectural sense. In the Gothic style the pointed shape of the inner arches lessens this incongruity to a minimum, as the very shape of the arch offers itself for any weight that may be put upon its apex; it suggests resistance, as it really is the only arched form that is stable under a weight. But over square-headed windows the case is different. Here a truss should always be avoided if possible, even if it be desirable to shift the windows or the truss that comes in the way. Nothing looks weaker than to see a heavy timber truss standing directly upon the head of and over the window opening. A little skill is sufficient to solve the difficulty in most cases. Another essential point is the selection of a truss to meet the requirements of the roof. The variety of forms is large, and the architect generally adopts either a direct tie-roof or one without, as a single-framed, collar-braced, or hammer-beam truss. For small buildings a single-framed roof—that is, one in which each pair of rafters forms a truss—is largely employed. The only tie consists either in a collar or cross braces; the ceiling being open or boarded in the shape of a barrel vault. At the springing uprights or studs are framed into the rafters, and thereby give a foothold to the roof on the wall, where they have a double plate framed; the inner plate taking a considerable portion of the strain if the walls are thick in proportion to the span. Now, in this form of roof, as each pair of opposite rafters forms a truss, a separate truss is not needed; in fact the roof forms a continuous shell or cylinder. This form of roof, therefore, seems admirably fitted for halls or apartments where equal spaced piers cannot be had, or for a continuous wall below. When we have a wall pierced by several large windows, as a Perpendicular hall would be, the idea of supporting the roof at regular intervals naturally occurs to us as the best. We have the narrow buttressed pier between lofty windows, suggesting that the roof trusses should be separate, or that the support of roof should be collected at intervals. By this means the "bay" is made a feature in the architecture, and economy of roofing is ensured.

The acme of scientific economy, as well as architectural beauty, is observed, unquestionably, in the intersection of a barrel vault by cross vaults, as in the groined roof of the middle ages.

But, in determining upon the kind of truss, the architect must consider the number of points of support he has to give to his purlins, and arrange his struts or pieces accordingly. This is seldom done; and we have seen church roofs designed on no principle whatever beyond that of conforming to a certain type. It is absurd to see an ordinary braced truss, or one without any intermediate support to the rafters carrying a central or two purlins on each side; it is certainly unarchitectural. These points of rafter support should generally be from 7ft. to 12ft. apart, according to the extent and pitch of the roof. To work out this condition properly, the amount of load the truss will have to carry must be calculated. The total weight of the timbers, planking, and slating must be added to any accidental force, such as that of wind or the weight of snow. Mr. Hatfield gives the following as the ordinary load on roof per foot inclined:—

Slate	about 7lb.	per foot.
Roof-plank	" 2·7	"
Roof-beams or jack-rafters	" 2·3	"
Total	12lb.	"

This load will be increased upon the horizontal foot, in proportion to the steepness of roof. In ordinary cases—for flat roofs—the author makes it 15lb. for roofing; 5lb. for roof-truss; 20lb. for snow; and 10lb. for wind; or a total of 50lb. on roof per foot, measured horizontally. Steeper roofs would have less vertical snow weight, but the force of wind would be increased proportionately, and this question has recently been discussed in our pages (p. 215). The wind in the United States is reckoned at 30lb. per foot on a vertical surface, and in very elevated places at 50lb. Having found the load per foot of roofing, and the points of support on the truss—say three spaces with two points of support on each half of the truss—the apportionment of the load must be made. This is arrived at by taking the superficial area between the points of support, measured horizontally, and the width of one bay. Let us take an example worked out, 60ft. span of truss. Thus, if the points of support in truss measure 10ft. horizontally, and the width of bay is 12ft., the weight at 50lb. per foot = 6,000lb. These preliminary loads having been found, the strains on the rafters may be determined by graphical means, as follows:—Draw a vertical line, and lay off, in five equal parts (to a scale of, say, 10 parts to the inch, each part representing 100lb.) the above load. Each half of this line represents the half weight on rafters, or half weight of truss which will equal the load upon one point of support. Next, from this vertical scale of loads, draw the horizontal and inclined lines parallel to the members of truss, thus forming a closed polygon which will give the amount of force in each. It is necessary, to save confusion, that, in a diagram of forces, no line representing one force shall be repeated; and that a point of convergence in a truss should be lettered to correspond with the line of the diagram. Thus, a line drawn parallel to any member of such convergence may be designated by the letters A and B placed at each end, and the same letters should indicate the corresponding member in the axial diagram of truss, by being placed on each side of it. If we consider a common cross-braced roof, loaded at the ridge, and, at the top of each brace, dividing each rafter into two parts, we draw a vertical line, and divide it into three parts representing equal loads, then the half of

these is sustained by one of the supports, and the other half by the other. A letter is placed on each side of a member which is designated by the two letters it separates, and then letters are used to indicate the corresponding line in the force diagram. By these means the force diagram is formed, and the forces or strains can be measured by the same scale of parts. For example, reverting to our first illustration with the load of 6,000lb., we take the strains on either rafter by measuring the line in diagram corresponding to its lower part, or that resting on the wall; an ordinary pitch of roof shows this to be 47,800lb. The next, or middle section of rafter between the purlins gives 42,000lb., and the upper third of rafter, near ridge, indicates a strain of 5,800lb. Having found the strains in the braces, verticals, horizontal members, &c., similarly, the next thing is to apportion the dimensions to the several parts, according to the ordinary rules for compression and tension. Referring to the strain diagrams given by Mr. Hatfield it is to be noted that the form of truss, with two inclined braces at a lower angle joining a vertical, and, in fact, forming two triangles joined in the centre, is far more economical than a truss with cross-braces and collar as ordinarily constructed. It is also shown that it is necessary to consider whether the small additional height gained to an interior by raising the middle point of the tie-rod, will adequately compensate for the increased strains thereby induced, and the enhanced cost of material necessary to resist the strains, or whether it is not more advisable to raise the walls of a building rather than the ties. The examples illustrated are more adapted for roofs of ordinary structures than for buildings of architectural pretensions; but if the same process of illustrating the strains in our roofs were used, architects would soon discover the most economical types to deal with. There are few grander forms of trusses than the old hammer-beam truss of the Westminster Hall type, but it is uneconomical in these days of scanty timber. What the architect is now called upon to design is a roof-truss of reduced material, in which the true principles of the truss are manifested rather than the idea of a constructed arch. The single-framed ceiled roof is admirably adapted for our modern churches and halls; but it is extraordinary that the use of iron has not been put to a more architectural use than that of making it perform the visible office of tie-rods in churches. If used thus, surely it can be employed more economically and artistically, not by making it look pretty by plastering all kinds of ornament upon it, as suggested by one Nestor, but by consistently making it perform the duties it is so eminently calculated to afford.

GALLO-ROMAN REMAINS AT CARNÆ.*

MR. MILN'S book is a worthy epitome of a very valuable series of explorations carried out at his own cost during 1874, 1875, and 1876, in a region which has a special interest for archaeologists. The title of the book is, however, rather too general—the excavations undertaken having been confined, with but slight exceptions, to the district of the Bosseno and the Mont St. Michel. The details and evidence collected by the author of Gallo-Roman civilisation, and the admirably arranged and illustrated record of them he has prepared, lead us to hope that Mr. Miln may continue his investigations into the age and character of the menhirs and dolmens which abound in the Breton country.

* Excavations at Carnæ, Brittany. By JAMES MILN, Edinburgh; David Douglas.

Mr. Miln's attention was drawn to the Bosseno mounds by a French archæologist who had been compelled to abandon the exploration of them. Mr. Miln determined to take up the work, and, with that object in view, attempted to purchase the site, but in this, to his regret, his efforts were frustrated; and thus, many difficulties, which otherwise would have been removed, remained to hinder his work. The mounds explored—eight in number—lie immediately to the south of the long undulating line of menhirs which passes north of Carnæ, towards the river Crach, and occupy an area of 6,578 yards. The mounds, of course, have their popular legendary history, which has, as the author remarks, a certain analogy with facts brought to light by the excavations. The tradition of the country is that the Bosseno were inhabited by the red monks (Templars), who, having exasperated the surrounding inhabitants by their crimes, were set upon by their neighbours and killed, and their habitations burned, in one night. The mounds have an evil reputation to this day, many of the peasants declaring that they are illuminated by night, and that animated conversations in Latin may be heard in their vicinity. The first mound opened in 1874 was a low circular barrow, about three feet high, and having a circumference at the base of about 130ft. A building of quadrilateral form was exposed, each of its sides measuring nearly 34ft., except that on the south, which was less than the others—an irregularity not uncommon in Gallo-Roman buildings. The walls, which were two feet in breadth, were carefully constructed of small cubic stones, laid in lime mortar. In plan the dwelling consisted of four chambers—three smaller ones, each about 9ft. square, on the western side being flanked by one large one, measuring 28ft. by 18ft., and occupying all the eastern side. The remains of two smaller constructions were detected on the inner northern side of the large chamber, which "might have been furnaces." The refuse covering the floors of the four rooms consisted of cinders, charcoal, and ashes, mingled with pieces of iron, scoræ, and even granite vitrified, and conveyed the impression that the building had been destroyed by fire, while the quantity of broken pottery found seemed to render it probable that it had been previously pillaged. The pottery found seem to have been made by hand, by the aid of the potter's wheel, and formed of earth consisting of the *débris* of primitive rocks, and badly worked. The firing must have been bad and unequal, and in this respect a strong resemblance was noticed to the funeral vases found in the dolmens. Mr. Miln includes the kistvaens, but we are not aware that the small stone chests known as kistvaens have been found to abound in fictile remains. Mr. Miln is careful to add that he does not feel himself justified in assigning the pottery found at the Bosseno to the remote epoch of the dolmens, and he appends a narrative of his own experience in the Hebrides, which sufficiently shows the caution necessary when such remains are made the subjects of a chronological classification.

Under the second mound excavated was found a house of eleven rooms, carefully constructed, and having its walls plastered and decorated. The building was of rectangular form, measuring 64ft. by 47ft., and contained three large chambers flanked by a corridor on one side with some smaller rooms on the other. The outer walls were 24in. thick, solidly built of small square blocks, with tile layers at intervals. A hypocaust was discovered under what appeared to be the principal room, covered with layers of cement, six inches thick, forming the flooring of the chamber above. The fragments of painted stucco found, together with the pottery and other remains,

are undoubtedly Roman or Gallo-Roman. Under the third mound was found a *balneum* or private bath, having a communication with the building discovered under the second mound, and under the fourth mound the remains of what Mr. Miln believes to have been a private temple or *lararium* (a sort of shrine or small apartment where the *lares* or guardian spirits of the household were worshipped). The *lararium* consisted of a square wall measuring 32½ft. on each side, and about 2ft. high, enclosing another square wall 14ft. on each side, about 2ft. high, and 3lin. thick, and without any entrance opening. On the floor of this inner enclosure, about 2ft. from the north wall, was found a stone slab which appeared to have been the base of a pedestal on which had been placed the statue of the Divinity to whom the temple had been dedicated. The access to the inner enclosure was probably by wooden steps, which have long since disappeared. The masonry of the walls of the *lararium* was much less finished than those of the other buildings, and had a much older appearance. The numerous fragments found of statuettes of the Goddess of Maternity and Venus Anadyomene were, Mr. Miln thinks, the remains of votive offerings to the shrine of Venus Genetrix, the divinity to whom the temple was raised. Under the fifth mound was found a building considered by Mr. Miln to be a *villa agraria*, its construction inferior to that of the *villa urbana* found under the second mound, and with little evidence of decoration or luxury. Some of the rooms seem to have been inhabited by labourers, and others to have been used as stables or store-houses. A bronze statuette of an ox, found in one of the rooms, seems to have an interest of its own in connection with a great *fête* still held yearly at Carnæ on the anniversary of St. Carneby or St. Cornelius, who is the patron saint of the parish, and is supposed to have been Pope in the third century. This saint is regarded as the protector of the beasts, and when the statuette referred to was discovered the workmen all crowded round it in a state of excitement, exclaiming, "Here is a discovery; we have found the ox of St. Carneby!" Mr. Miln asks whether we are to attribute this statuette to Egyptian or Celtic mythology, or to the Mithraic worship. We know that the worship of Mithras was introduced at Rome about the time of the Emperors, and thence spread throughout the Empire; and the presence of the ox in Celtic mythology is familiar to antiquaries. Whether the statuette has any connection with the fact or not, the festival indicates that the Gaul of the Bosseno, in adopting the religion of his Roman conquerors, and subsequently of Christianity, had not altogether abandoned his own deities and customs.

The buildings found under the other mounds could not be traced or determined with certainty. One may have been a smith's shop, and another a military post or station for the defence of the inhabitants of the Bosseno, which was exposed to attack not only from the land, but from the sea as well. The coins found among the *débris* in the various buildings excavated range over a period of two centuries, between the reigns of Marcus Aurelius and the death of Magentius (A.D. 353). The immense quantity of oyster-shells and other *débris* of edible fish exhibit a decided taste on the part of the inhabitants for this kind of food, and show that the Breton coast was then as now celebrated for its oysters.

Altogether Mr. Miln seems justified in the conclusions to which his researches have led him. We know that the deplorable condition of Gaul during the latter part of the fourth century is recorded by all historians. Overrun by barbarians against whom the Romans afforded no means of protection, the people strove in vain to en-

dure their misfortunes, until in the fifth century came the general rising which took place in Armorica against the Roman Government; and this period, in Mr. Miln's opinion, is the epoch to which may be assigned the violent destruction of the Bosseno. It is true that Christianity had at this time made some progress in Armorica, but no vestiges of its existence in the Bosseno were discovered; it may therefore be surmised that for some misdeeds its pagan inhabitants had been driven away, and their houses burned by their Christian neighbours, and so far that the current legend is the echo of a forgotten event.

We should not omit to say a word in conclusion in praise of the manner in which the illustrations of Mr. Miln's book are executed. They are the work of French artists, and their faithfulness and delicacy of execution are qualities too little familiar to us in this country to be overlooked.

ENGLISH CLASSIC.

THE revival of seventeenth century architecture has led to a return, in London at least, to the use of red brick as a building material. The change is grateful after the wearisome monotony of the common yellow "stocks" which one meets everywhere. Several new buildings have recently been erected in which this material has been judiciously combined with stone in the dressings, and we are glad to see the revival of a Classic style, of which Hampton Court may be taken as a type, which suits this combination. At the corner of South-ampton-street and Covent-garden a large hotel is erected, in which the two materials have been pleasingly blended. The rusticated basement is wholly of Portland stone, and this has been carried to a bold height, including a mezzanine. Above this the red brickwork commences in piers between vertical lines of boldly architraved stone windows, of a treatment more thoroughly seventeenth century Classic than Queen Anne of the baroque school. The detail is thoroughly English, vigorous, and far more Classical in feeling than we have lately been accustomed to see. The vertical lines of fenestration are broken by curvilinear-shaped balconettes and cornices between the windows, and the old-fashioned triglyph and block cornices are introduced, as we see them in the earlier classical works of the seventeenth century.

Another successful attempt is seen in King-street, Covent-garden, in a large, lofty, and wide-fronted building near Evans' Hotel. The architect has been successful in overcoming the inert and commonplace shop-front, by arching over his glass front, and placing it centrally between the side doorways, which are boldly treated, and have fan-lights and pediments over them. The effect is that of giving an apparent basement to the structure, and to make the openings appear as perforations in the rusticated substructure, thus avoiding the unpleasant appearance of the usual yawning plate-glass front below, upon which the building appears to rest. The centre front has an elliptical arch, which abuts against the side rusticated piers in which the doorways are formed. Above, the structure consists of three vertical bays of stone fenestration, with red brick piers between. The architraves are boldly treated; and made to project from a stone set-off, which has the effect of recessing the brick piers. Between the windows we see the cornices made to project, and form a kind of curvilinear balconette, with deep triglyphs below the architrave moulding. There is no flippant carving or ornament, and the whole effect is obtained by the bold mouldings and architectural lines. These vertical bays of

windows are carried up above a block cornice, breaking the balustrade which stops against them, and terminate as bold consoled dormers, crowned by curved pediments. The points we remark as improvements upon the customary and flimsy Renaissance of the day are, that the windows are carried up as continuous and projecting bays, the brick-work being recessed; that the balustrade, instead of running through, with dormers set back, is stopped against the latter, which are carried up flush, and form a prominent and pleasing sky-line; and that there is little carving introduced, the architectural members being bold, and the mouldings simple cyma-reversas or ovolos. As a rule, the revived Classic of twenty years ago with which we were deluged displayed nothing of a national character. It was a flimsy and capricious Renaissance devoid of its true spirit, and destined to submit to the more thorough spirit of Gothic. Hence it was that Gothic soon supplanted it. This Renaissance was extremely plastic, and lent itself to composition. Many of our City offices and hotels display the style; we may note the Cannon-street and Charing-cross railway hotels as works considered equal to the time. Brick and compositum or brick and stone were used, but the faults of the style were superficial treatment, terminals, balustrades, carved work, and a superfluity of decorative adjuncts that gave a stamp of pretentiousness unworthy of the real spirit of the style. These works had nothing in common with the great works of the seventeenth and eighteenth centuries, such as Hampton Court and Holkham Hall, such structures as those of the Tuileries and Louvre, or those portions of them which exhibit the earliest and purest phase of Renaissance. Another structure in a similar spirit is being erected in Tottenham-court-road for Messrs. Moeder; the piers are entirely of red brick, and the openings are more varied, but all have characteristic stone heads, and pediments triangular and curved. We point to this taste as significant of a revival of the features of a purer Classic than that we have lately been accustomed to see. The baroque and rococo mixtures have been tried, but they are found less satisfying than the truer developments of an architecture fitted for the materials at our hand.

THE ROMAN WALL.

ON Tuesday, a number of the members of the Iron and Steel Institute, which is at present holding its annual meeting at Newcastle, paid a visit to the remains of the Roman wall. Arriving at Chollerford, the visitors were met by Dr. Bruce, who first directed their attention to the abutment of the bridge, with the ruins and castellum adjacent. This forms the termination of the wall of Hadrian, on the eastern side of the North Tyne, and at this point the abutment of the bridge joins it. It is evident that the river has, during the years that have rolled by since the Roman occupation swerved to the west and left the eastern abutment high and dry, whilst in its turn the western abutment has been covered with water, as the stones which formed it may still be seen at low water when the river is clear. The learned Doctor pointed out the various positions which research has brought to light, and explained their connection with the history of Roman occupation. In the bed of the river two or three piers have been traced, and these are identified as those which supported the bridge. This structure is undoubtedly horizontal, as no stones showing the foundation of an arch have been found, whereas blocks have been recovered which contain slots, in which the beams of wood evidently rested. The abutment which remains on the eastern side, and which was inspected, has evidently been repaired or altered at different periods. The end of the wall, which terminates in a square building or castellum, is surrounded in front by

a bow-shaped mass of masonry, bevelled off on each side, to resist the action of the stream or the rush of backwater. In the centre of this masonry is the form of a small pier, which is not in a line with the sunken piers in the river. It is, therefore, conjectured that this internal pier was originally part of Agricola's rude bridge, built in the year 80, when that commander endeavoured to secure his advance by a line of fortress across the country. When Hadrian built his wall, in 120, he would probably take advantage of this pier of Agricola's line of works to build the abutment for throwing across his own bridge, and surrounded it with improved masonry to resist the action of the water. At a later stage it appears to have been repaired, probably by Severus, in 208, who, finding the wall and bridges in a dilapidated state, repaired them and put new facings on the abutments. The tooling of the stones is peculiar, and resembles that of other bridges built by the same person, the same kind of work, for instance, being found in a bridge over the Tyne at Corbridge. The party were then conveyed across the river in a boat, in the direction of the Chesters, to examine the remains of the old Roman station there, attention being directed on the way to the old road which ran down from the city to the bridge across the river. A short distance up the line of the wall may be seen the eastern gates of the old station of Cilurnum, or Walwick Chesters. The south-western gate of the camp was first inspected. This is a single gateway, and is peculiar in that respect, as they are generally found to be double. It was not supposed by antiquaries that a gateway would be found on the north side of the wall on the eastern front, but such a gateway was discovered by a chance circumstance. A rampart existed on the north side of the wall, and in searching to find how this was joined to the wall, the excavators came across a double gateway in a very perfect state of preservation, with a guard chamber on each side. The presence of a double gateway in this position was at first difficult to explain. It is conjectured, however, that this was one of Agricola's stations, built in the year 80, whilst the wall was not erected until the year 120. It is known that Hadrian took advantage of several of the positions built by Agricola, and it is supposed that this was one of them. There is evidence that the gateway and guard chambers were filled up with rubbish, and it is probable that the position was turned into a rampart upon which to erect catapults and other engines of destruction. The interior of the station was next inspected. Here Dr. Bruce pointed out the old streets. With the exception of the main intersecting streets, the thoroughfares of these old stations were generally very narrow, and one, little more than 3ft. wide, may still be seen in a very perfect state of preservation. The whole town which has been excavated is, in fact, very perfect, and a most interesting half-hour was passed in examining the remains. The foundations of the houses, with the arrangements for heating them, and the drainage system, are both very clearly defined. The Prætorium was pointed out, and attention was called to the door-step, which distinctly bears the marks of wear. It is not difficult to observe that this was the place of public assemblage, as the old Romans have left their footmarks on the flagging as they passed in and out from time to time during their stay in the place. The flagging of this building is considerably broken, but that is accounted for by the presumption that when the Northern barbarians gained possession of the place they did their best to destroy everything by hurling down walls and razing the place to the ground. Perhaps the most interesting features of this ancient Prætorium are the arrangements made for heating the place. The furnaces still remain, and the stones surrounding them show traces of having been acted upon by heat, and when exposed to the air they break up. The floor under which the heat was carried, was supported upon pillars. Many of these pillars, with the flooring upon them, still remain intact. The pillars are chiefly made of tiles. The floor which they carry is very curiously constructed. At the bottom is a layer of flags covered with concrete. Upon this again were placed more flags, and

upon them a layer of concrete, worked in ornamental patterns. In the south, where the Romans had a more peaceful population to deal with, they placed tessellated tiles upon this last layer of concrete, but in the north the Scots gave them little leisure for that sort of thing. The Forum, or market-place, was next pointed out, and its different positions traced. This square was open to the sky, and was surrounded by a colonnade and wall; and, judging from the capital of one of the pillars which has been discovered, the place must have been very ornate. At one entrance to the market are still to be seen the wheel marks of their vehicles, whilst the stone work of the porchway has been chipped and broken by frequent collisions with erratic waggons. At one corner of the Forum stood a covered archway, presumably for the protection of perishable goods. From the roof of this, when the water dripped, it fell into a little gutter beneath, whence it was carried away. This gutter is as perfect to-day as it was when the last Roman vacated the place, and the water-worn stones can be distinctly seen. Several other features of the excavated station were examined, including the subterranean chamber on the south side. The discoveries consequent upon the excavation of this chamber were very singular, and the story as told by Dr. Bruce very interesting. Residents in the neighbourhood formerly had a tradition that a horse regiment was stationed in the town, that the stables were under ground, and that the horses were buried there yet. It was curious to observe, the lecturer said, that this was in reality a cavalry station, a portion of the Asturian cavalry being quartered there. When the excavators came to the chamber they thought that the tradition was going to prove true, and that they actually heard the neighing of horses. The chamber was blocked up with a strong oaken door studded with iron nails. A number of coins of the time of Severus were found, and the conclusion at once came to was that this was the *Ærarium* or treasury, where the pay for the army was kept. This opinion was subsequently confirmed. It had been found that the courts of justice were generally situated near to the *Ærarium*, and further excavations brought to light two chambers contiguous to the Forum, which were considered to be undoubtedly the justice chambers of the place. From the old city the party proceeded to the residence of Mr. Clayton, of the Chesters, where they were permitted to inspect the extensive stock of Roman remains gathered together there. The collection of Roman antiquities is of extraordinary magnitude, and includes specimens of altars, engraved stones, pottery, glass, and metal work. Several of the remains were explained by Dr. Bruce, especially these recently discovered in the old Roman station of Carrawburgh.

BUILDING NEWS DESIGNING CLUB.

LIST OF SUBJECTS.—XV.

A. A conservatory attached to a Gothic house at one end. Size, 20ft. by 12ft. Provision to be shown for warming and ventilation. Plan, two elevations, and details. Scale, $\frac{1}{2}$ in. to the foot.

B. An organ case in oak, for a small church or hall. Plan, elevation, and details. 1 in. scale, and a quarter full size.

C. A mullion window in stone, with external shutters. Size of window, 8ft. by 4ft. Plan, elevation section, and details. 1 in. scale, and a quarter full size.

RECEIVED.—“Josephus Orange Blossom” (drawings are returned), John T. Groves (a list of subjects appeared in our issue of a fortnight ago, and to-day another list will be seen).

DRAWINGS RECEIVED.—W. K. B., James Whitton.

COMPETITIONS.

RECREATION GROUND LODGE.—The design selected by the Lewisham Board of Works for the lodge of their new recreation ground for Sydenham and Forest-hill is by Mr. Robert Walker, of King's Arms-yard. There are in all 34 designs sent in, and the whole have been arranged around the Board-room, for inspection by the architects and public generally during the ensuing week.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE NEW EAST AND WEST INDIA DOCK-HOUSE.

This building, situated on the site of some old houses in Billiter-street, recently demolished, is rapidly approaching completion, and when finished will prove an architectural ornament of which the City may well feel proud. Increasing demand for accommodation, as well as necessity for the demolition of the old Dock-house, to make way for a new street, have obliged the company to erect a substitute, and with the assistance of their architect they will now be in a position to transfer their business to an establishment likely to prove satisfactory in every respect. The foundation stone of this building was laid in December last by Mr. Percival Bosanquet, the then chairman of the company, in presence of a large number of the directors and friends, and the whole of the work will be completed in time to allow of a transfer of the company's business from the old to the new house before Christmas next. On account of the peculiarities of the place required to suit the various groups of offices, it was necessary to adopt a style of architecture which would allow of free treatment without sacrificing any space for recessing portions of the structure, from which much of the effect of a Gothic building is obtained. Under the circumstances the architect adopted a modification of Venetian Gothic as best, allowing of the necessary freedom of detail on a flat surface. The fronts are faced with Box Groundstone, relieved with red Mansfield in the voussours of arches, and over main entrance. The whole of the columns are of polished red Aberdeen or blue Peterhead granite. The plinth is of grey Cornish granite with fine tooth-axed face. The bosses are principally of polished red and blue granite, but some of the groups at angle are in various-coloured marbles. With regard to its internal features something may be said. The top floor consists of suites of apartments for house-keeper and officials. The second mezzanine floor will be devoted to luncheon-rooms, lavatories, &c., for the use of the directors. The first floor will be occupied by the secretary and the *personnel* of his office. Upon the same floor is the court-room for holding the meetings of directors and half-yearly meetings of proprietors. The whole of the internal decoration is in character with the exterior—the dado windows, doors, &c., all being in wainscot, relieved by carving. The ceiling is panelled, its richly-carved supports representing different fruits, &c., emblematical of the various commercial products which fill the company's warehouses. A massive mantelpiece of marble, surmounted by a large mirror, gives a palatial appearance to the apartment, which is lighted by large double windows, and from the ceiling by a single gas "sunlight." This, as well as the floors below, is reached by a spacious stone staircase, on which a large glass dome sheds ample light. On the ground floor is the general office, 43ft. long by 33ft. wide, its ceiling supported by ornamental iron columns. The shipping, divi-

dend, and pay offices are also situated on this floor. In the basement lavatories, luncheon-rooms, &c., for the *employés*, and a school-room for the messenger boys, are provided, and a portion of the space is occupied by strong rooms and heating apparatus. Without going into further detail, it may be said that this handsome edifice contains, or will contain, every convenience that appertains to our largest commercial establishments of the present day. All the principal rooms are provided with open fireplaces, but in addition, the building is warmed throughout by Messrs. Price and Co.'s plan of hot-air flues. Great care has also been taken to provide for efficient ventilation. The architect of the building is Mr. A. Manning, the Dock Company's engineer. The builders are Messrs. Merritt and Ashby, to whom great credit is due for the care and speed with which they have carried out the work. The stone and wood carving has been executed, from the architect's designs, by Mr. Bradford, of Kennington-road. Mr. Holloway has been the clerk of works.

OLD HOUSE ON THE QUAI SAINT JEAN,
STRASBOURG.

EXAMPLES of old work are being destroyed more ruthlessly, perhaps, at Strasbourg than elsewhere, so that any record of them is interesting. Our lithograph is from a pen-and-ink drawing which was exhibited in the Royal Academy this year. This drawing was made from a water colour, sketched at Strasbourg in 1875, by Mr. Philip J. Marvin, during the time he held the travelling studentship of the Royal Academy.

ST. MAC CARTAN'S CATHEDRAL, MONAGHAN.

We give an interior view of the Cathedral of St. MacCartan, first bishop and patron of the ancient diocese of Clogher. The cathedral is situated immediately outside the town of Monaghan, on rising ground, at the junction of the Dublin and Armagh roads. Its plan comprises nave and aisle, choir terminating in a polygonal apse and transepts, with four chapels projecting to the east. North-east of the choir and lateral chapels is a pile of buildings containing sacristies, chapter-room, cloisters, library, and other capitular requirements. A spacious baptistry, terminating in an apse, projects from the second bay of the north aisle, and a tower and spire stand at the junction of the south aisle and transept. The dimensions interiorly are 180ft. in length, 72ft. wide across the nave and aisles, 113ft. across the transepts. The total height of the tower and spire will be, when the latter feature is finished, 200ft. The building has been several years in progress under the zealous care of the present Lord Bishop, and is now approaching completion. Mr. J. J. McCarthy, R.H.A., is the architect.

HOUSE AT HEATHFIELD, SUSSEX.

This small house at Heathfield, which has just been completed from the designs of Mr. Keith D. Young, of 11, Red Lion-square, is as simple in its arrangements as it well could be, being intended chiefly as a summer residence. It is built of local red bricks, the upper part being timber framing, covered with local plain tiles. All the interior fittings are of the simplest description. The work was carried out by Mr. Holman, of Lewes.

MOUNT VERNON, THE HOME OF WASHINGTON.

Among our lithographic plates this week we publish some measured drawings of Mount Vernon, the home of Washington. The building is no longer employed as a residence, but is simply used as a show place. The house was much altered by Washington, and he added the wings to the right and left of the main building, and the interim fittings are by his arrangement, the several parts having been bought from time to time, chiefly in England, and brought by the illustrious owner for the embellishment of his home. The ground plan, which we give, illustrates the planning of the principal rooms, and the details are drawn to scale with marginal references, which accompany them, and thus render further description unnecessary. The measurements were taken by Messrs. V. C. Taylor and W. H. Wood, and the drawing was made by the latter gentleman.

OLD BARN, HARMONDSWORTH.

THE view which we publish to-day of this interesting old barn, of 13th century date, is from a drawing by Mr. G. R. Webster, of Slough.

ARCHÆOLOGICAL SOCIETIES.

NORTH STAFFORDSHIRE ARCHÆOLOGICAL SOCIETY.—On Tuesday week the members of the North Staffordshire, and Burton-on-Trent Archaeological Societies united in an excursion to Repton, under the leadership of Mr. W. Molyneux, F.G.S. The two parties met at Willington, and after taking some slight refreshment pushed on to Repton. On the way they saw from a little distance an earthwork, which, on rather slight grounds, is believed to have been a Roman entrenchment. Repton (the Repandune of the Saxons) is a place of great antiquity: it was the residence of several Mercian kings, and was the site of one of the earliest ecclesiastical foundations in the country for it was here that St. Werburgh established a nunnery about the year 656. This, together with the town, was destroyed by the Danes in the course of their great invasion in 874. The church then existing was overthrown by the invaders, and it probably lay in ruins until, after a lapse of some two hundred years, a new church was built in the Norman style. A priory of Black Canons of the Order of St. Augustine was founded at Repton by Maud, widow of Ranulph, second Earl of Chester. And, lastly, in 1556 Sir John Port established a free grammar school at Repton. The party were received at the Priory gate by Dr. Huckin, the head-master, who gave every facility for the study of the antiquities of the place. In the basement story of his own house are two massive columns. These no doubt formed part of the Priory church of which besides only two or three fragments remain. A portion of the walls of the chancel are Anglo-Saxon work, and beneath is the crypt, which is a place of exceeding interest. It is about 17ft. square, and the ceiling is supported on stone arches resting on wreathed columns, apparently monoliths. Mr. Molyneux spoke for some time in the crypt, (taking advantage of the shelter which it afforded) and Mr. C. Lynam, at his invitation, also made a few remarks. Mr. Lynam said the crypt was beyond all doubt Anglo-Saxon work, and there was nothing in the county of Stafford which approached it in regard to age. Mr. Lynam pointed out several particulars in which the masonry resembled that of the Romans—in fact, two pilasters which are nearest to the east window of the crypt have quite a quite Classic air, and are as truly of Classic descent, however rude, as the alabaster slab in the church above (*tempus Elizabeth*) is a debased example of the Gothic art which flourished in all its beauty three hundred years before. Repton church is considerably above the average of country parish churches in point of size, but the chancel is very small, and naked and colourless. A portion of the nave arcade was Early English, with Norman arches and columns in the two bays nearest to the chancel, but a former clergyman had the whole of the ancient stonework chiselled smooth and neat, and for the sake of obtaining uniformity pared down the Norman columns and converted the round arches into pointed! The school built by Sir John Port was also visited, and over the principal fireplace were found some scores of mediæval encaustic tiles cemented into the wall. Mr. Molyneux explained that some years ago the remains of a manufactory of encaustic tiles were found within the Priory grounds, and a portion of one of the ovens (which was inspected) is still in existence. After exhausting the antiquities of the place, the visitors proceeded to the Bull's Head inn, where tea was spread.

A new wing for 50 male patients has just been added to Wilts County Asylum, near Devizes.

The new Victoria Baths, at Glasgow, were opened on Saturday last. The cost of the building has been £10,000. Mr. J. L. Watson is the architect.

The foundation-stone of a new Wesleyan chapel has been laid at Guernsey. The building, which is to cost £5,000, is being carried out from the designs and under the superintendence of Messrs. Wilson, Willcox, and Wilson, architects, Bath. Mr. D. C. Jones, of Gloucester, is the builder.

THE GREAT BARN, HARMONDSWORTH, MIDDLESEX.

TURKISH AND RUSSIAN COTTAGE-BUILDING AND FURNISHING.

NOW that not only "rumours" of wars are matters, as they always unfortunately are, of daily excitement, but actual war is going on, on a specially exciting scale and degree of activity, it is at least some, though perhaps but small, comfort to find any circumstance in and about it which can be thought to be advantageous to humanity anywhere. The Turk and the Russian are, as it would seem after all, to be, on the whole, pretty well matched; and to be, as far as their social state is concerned, to be on terms of all but equality. The Turkish soldier, and the Russian soldier, when they return to their humble homes—to the cottage homes of Turkey and Russia—must, as will be seen, go back to all but the same places. The war now going on may be, beyond the present hour, of more or less interest; and it seems not a little strange that a something more as to the future, a little out of the common place, has not been said about it by those who see a little beyond the mere bloodshed, and slaughter, and destruction of material. We do not venture even to hint at it, but there may be an interest in the getting a little insight into the "cottage homes" of those who after all suffer, and must needs suffer, most severely and acutely. What the Turks and the Russians are now doing we are told of hour by hour, and where they are we know; but where do they come from, and how do they live when at home, and what are their homes like? We have always felt, perhaps, a more than usual interest in the special dwelling places of the common people—to use a general phrase—and do not think that sufficient attention has been as yet devoted to them. Yet, what can be more to the purpose than such a subject is, when looking for the foundations and origin of architecture, even as a fine art, as well as a constructive art? Cottages and the dwellings of the common people, all the wide world over, must, we are quite sure, have preceded temples, and aqueducts, and causeways, and the mighty tombs even of mythical heroes. There must have been "cottage homes" of the Egyptians before there were pyramids. All the world over this must needs have been, and the very origin of that building or architecture must needs have been powerfully influenced by, if not actually a growth out of, the humble dwelling of the prehistoric man. We are not now going quite so far back into time as here indicated, but intend only to point to those humble dwellings of the Turk and Russian as they now are, and have been, as far as we can see, for ages past. It is all but a new subject, for cottages and rough-built primitive huts for rude men and peasants are not thought commonly to have much to do with architecture or fine art. But, indeed, they are so. It is not quite so easy a task as many might be led to suppose, to find from the accounts of travellers, what the cottage of the Turk or the Russian is really like; for travellers, as a rule, keep to the cities, and look mainly at the more important buildings in them. But what we want here to come at is the common cottage, or hut building of the common people. The houses of the Turkish villages, say the travellers, seem to be *very much alike* all the country over; and there can be but little doubt that they are really so; and not only alike now-a-days, but have been so for many, many generations past. On the *outside* they look for all the world like mere square boxes. They measure, on the average—inside measurement—from 12ft. to 14ft., and are built of rough stones of all shapes and sizes, cemented together with "mud." The roofs are flat, and covered with earth, rough beams of wood being laid from wall to wall, and roughly

planked over to support this earth covering. A small *roller*, it may be mentioned, is generally to be found on this rude roof covering, for the purpose of keeping the earth flat, and as hard as possible, so as to more effectually keep out the wet. It may be noted, as a curious artistic and architectural item, that as this roller does not very readily touch effectively the extreme edges or corners of the earth covering that it is here a little loose, and favours the growth of weeds and grass, which grow at times most luxuriantly, and thus are seen from the street; and it has been suggested that this tuft-like leaf and grass ornament suggested, many ages ago, the leaf ornament so often seen on the antique Greek buildings, on the angles of the roofs and elsewhere.

Thus far we have the empty hut. There is no window, so that light is admitted solely through the ever-open doorway. The door has no lock or other fastening, but a bit of wood is suspended over the top of it inside, and falls down when the door is shut; while on the outside hangs a peg by means of which this fastening may be pushed up.

The walls and floor inside this cottage or hut are mud-coated, the mud being mixed with short straw to bind it. There is a rude and rough enough chimney, up which the wood fuel at times is piled high. This interior is, as might be expected, black with smoke, so that, as the travellers tell us who have looked in these abodes, it is dark enough. Such is the cottage of the Turkish soldier when at home. Those who are now fighting so fiercely came all of them from such, and to such they, or some of them, must needs return. But there is a something of human interest even here. The lamps, to begin with, Sir Charles Fellows says, though of tin or common earthenware, are after the beautiful forms of the antique Greek and Roman lamps, and lamps there must needs be.

No furniture, as that term is here understood, is to be found in these cottage homes of the Turk. When a visitor arrives the owner of the house sweeps out the room, and spreads a mat. A few nails in the rough wall serve to suspend all superfluous articles of clothing. The hammock and mattress for sleeping rest, of course, on the carpet or mat, where any handy article serves for a table. There are no chairs, and yet, say those who, like the travellers of old days, go to see what they cannot see at home, when this humble abode, thus unfurnished but with a bright wood fire, and with all things round about, is an "extremely enjoyable" abode.

It is this, then, such as it is, that the Turkish soldier leaves when he goes to war, and to this he must needs return; and it is no wonder that so little is needed of preparation to induce him to leave it, even for war. All his wealth he carries about with him, and is personal. And his Russian foe, it may here be noted, differs but little from him except in this—that his cottage home is of wood or timber, the walls of rough stuff as it is cut down. There is nought that is new here, for the houses of the antique and polished Greek were all but the same 3,000 years back.

It must not be supposed that the *houses*—we will not now call them "cottages"—of the common Turk, as found—we will not say in his towns, in out-of-the-way places sometimes not to be found by name in the best maps, but in the capital city itself, in the far-famed and world-known Constantinople—differ much from those. In the narrow and uneven street-ways there are the same abodes, differing but little from what is actually, as above seen, in the villages and out-of-the-way places, and standing by themselves. Why, the streets of this famous city, say the dainty travellers, are better certainly than other eastern cities; but

surely none in Europe anywhere else can convey an idea sufficiently bad, even for the best of them! The houses of the better sort of people, even the largest houses, are not unfrequently burnt down within the space of ten minutes, being constructed entirely of wood. But the ordinary houses, or dwellings of the common Turk, are like to those above. But few travellers care to go through the long, narrow, broken, poor streets of any city; and the accounts we get are of those parts only where "improvement" is working some change, and introducing foreign notions and imported details. It is only in the mosques of a Turkish town that "architecture," as we now understand the term, is to be found, and which gives character to these towns. Mosque architecture, by the way, is all but a new subject, and of it but little is known. Mosques are colossal structures as compared with the small dwellings by which they are surrounded. There is in them but little external architecture with the exception of the minarets.

And now of the Russian soldier as he is when at home, and of his dwelling-place, or cottage, or house, as it is in his villages, for indeed they differ but little, if at all, in general type or character. All that we have above said applies here, as far at least as rudeness and roughness are concerned. The details differ, and the construction is of timber for the most part, and the roofs of the huts, or cottages, or houses are gabled; but the interiors are as empty as those of the Turk, and as dark, and as smoke-begrimed, if not more so, if that be indeed possible. The Russian villages, the Marquis de Custine tells us, consist mainly of a double row of small wooden houses, more or less ornamented with "carvings," the gable ends facing the street, with commonly a large open court, with a "shed" at one side of it. Clay construction is not forgotten; but from one end of the Russian Empire to the other the greater number of rustic dwellings are of rough timber, carelessly hewn, and caulked with moss and resin. Monotony, says he, is the divinity of Russia. It must not be thought that there is much of anything new here, for if we go back in time—3,000 years back—we shall find evidences of the like style and system of cottage-building, differing in detail, it is true, but in the main the very same. The bas-reliefs to be found in our collections will soon evidence this to any who will look attentively for facts.

C. B. A.

THE VICE-PRESIDENT OF THE COUNCIL OF EDUCATION ON SCIENCE AND ART.

AT the annual meeting of the Burslem School of Art, held on Monday evening, Lord Sandon presided, and spoke some sensible words to those who are always insisting on the necessity of increased State aid to art and science. He remarked that when the question of Government aid was brought forward, people ought as citizens to be on their guard, and look with apprehension upon what was a growing tendency in the country to ask State aid to lift individuals and localities out of difficulties. They had to guard themselves against that decay of national character which was perfectly certain to follow if they trusted too much to the interference and tutelage of the central Government. Formerly the mere fact of goods being of British manufacture was considered to be proof of the solidity of the work. They had not that artistic value which the productions of some other countries possessed, but the world relied on the goodness of the articles; and he hoped they would regain that character. It was necessary to have artistic cultivation, so that they could compete with more southern countries; and here came the use and the national importance of schools of art and science, and here was one of the reasons why Government was justified in supporting schools of art generally. It was necessary, as they had

shorter hours, to have the assistance of every kind of scientific apparatus in the treatment of every branch of manufactures. They wanted in trade much more of artistic cultivation, and all the knowledge of science that Government could assist them to acquire; and with those two potent auxiliaries he believed they would be able to regain their position in the markets of the world. That was the justification, in his own mind, for Government interference with localities, by what had been done at South Kensington years ago. The Government gave that great centre of South Kensington a hard push, pushed it forward with might and main, and he was glad no Government had since neglected it. To his mind that great centre had done work such as the nation might be proud of, and no community in England had profited more by the aid of the South Kensington Museum than the Staffordshire Potteries. There was proof of the success of wise Government interference. They could not say too much in honour of the permanent officers of the South Kensington Museum, who had really done more for the advancement of science and art than the Government. He hoped they would forgive him for going rather more carefully into this point than was customary on such occasions; but he thought it was well to look sometimes at these points from a national, and not merely a commercial or local, point of view.

The report of the committee, read by Mr. F. M. Julian, the honorary secretary, stated that the progress of the school continued satisfactory. The number of students attending the art classes under Mr. Theaker during the year had been 188, an increase upon the previous year. Great activity has been displayed in the modelling class. Most of the students had satisfied the examiners, and the full grant had been allowed by the department. Three students had obtained prizes, and one a bronze medal. In the science section, under Mr. Byatt, there had been considerable improvement during the year. The students numbered 159, of whom 61 had passed, and 25 had gained first classes and Queen's prizes. The number attending the building construction class had not been so good as was expected, considering the extra prizes which had been offered by the Builders' Association and Mr. Webb, and the committee hoped to see an increase in the attendance.

TIDAL HARBOUR CONSTRUCTION.

AN interesting paper on the above subject appears in a number of the "Journal of the American Society of Civil Engineers," read by Mr. Clinton B. Sears, of the Engineer Corps, U.S.A. The author enters into the principles of harbour construction as laid down by well-known authorities, and applies them to the construction of an actual tidal estuary at Wilmington, California. In all operations for improving a harbour, the importance of an accurate and thorough examination of the tidal conditions is insisted on as the first step. The area, section, range of tide, velocities of currents, and topographical survey of the site, with a complete record of soundings reduced to a datum plane, as that of mean low water, are the first requisites in designing harbours. Borings, for the purpose of showing the substrata and geological peculiarities are also highly necessary to the engineer, and too much labour cannot be bestowed upon these preliminaries. The tidal influx and discharge, and the tidal volumes, are especially required in forming an idea of the basin and sections of water-way, and a prolonged study of the special local tides should be made. The author follows Mr. D. Stevenson, Prof. Ferrell, and some other authorities upon the fundamental requirements of a tidal harbour. "The most perfect type of a tidal harbour," we are told, is one in which the water-way sections decrease gradually from the sea inland, and then expand into a basin of large comparative area, thus forming a reservoir for the temporary storage of the high tides." Three tide gauges are recommended—one near the open sea, protected from wave action, one near the middle, and one at the upper end of harbour. If the estuary is long and narrow, or tortuous, a great many more are required, their zeros being referred

to one level, and the self-registering gauges are the most economical. It is laid down that any construction exposed to the waves should have its axis parallel, or nearly so, a slight obliquity reducing the percussive effect of the waves. Should the object be to close certain entrances, leaving one, it should be that one most nearly in the direction of the prevailing fair weather winds, so that sailing vessels may go as far as possible without the aid of tugs. The entrance should be trumpet-shaped, with the widest high water section seaward; the low water sectional areas should contract as little as possible, and any construction to close an entrance should follow the contour of shore as nearly as other conditions permit. Spring tides must be taken as the scouring power in moving material, as their rise and fall includes the greatest range, and their velocities are necessarily also greater than neap tides. The ebb tide is always the best scouring tide, its power being 6 to 8 times greater than the flood tide. Thus the spring flood commences from a high neap and runs to extreme high, while the ebb starts from this latter high level and falls to extreme low water, or the former has a range of about 5ft., while the ebb has a range of about 8.5. The maximum ebb tide velocity is at the beginning of the third quarter, and at the end of the fourth the velocity of current rapidly decreases. In planning a tidal harbour, care should be taken not to retard or hold back the last of the flood tide, thus preventing the water reaching the higher reaches of the tidal basin; but the works should be planned to facilitate a free inflow, and also formed to give a direction to the ebb tide in one channel, so as to utilise its power. The author observes, "A work whose top level is bare at half tide will, as a rule, meet this best."

The construction of training walls or jetties is one of the main considerations in harbour improvement. Those near the entrance should be lowest, and those in the upper end the highest, thereby insuring an easy inflow, and full upper reservoir, as well as a direction to the ebb within a concentrated channel. It may be necessary, in long single lengths of wall, to give a low elevation, and vice versa. Training walls, the author says, may do more harm than good if not wisely planned, and of this we have abundant evidence. Their chief object should be to concentrate the currents so as to produce scour in shoaling parts, and the tidal currents should be concentrated on one axial line without excluding tidal water from the estuary. It is of primary importance to preserving the capacities of the upper parts of a tidal basin, and it is generally agreed that contraction, though it may benefit navigation at one point, injuriously affects the lower parts of the estuary. Thus, if an estuary has a bar at its mouth, it will be injured if the basin is encroached upon, and the same applies to a river with shoals along it. In building training walls, the work should be simultaneously put down to avoid the scouring out of the material. Raking, dredging, or blasting may be had recourse to, to help the scouring. The former should be done during spring tides, when the current is fastest, the rake being kept in the middle of the current, so as to make a narrow deep furrow. The dredged material should be deposited so as not to reduce the sectional area of the channel or entrance.

The characteristics of Wilmington harbour are next described. It appears the ocean has been gradually pushed back to its present limit, and that an island of drift called Rattlesnake Island, about two miles long, forms Wilmington estuary, and a broad flat shoal area, having only about 1.5ft. of water at mean low water, existed. The high-tidal area of basin is about 1,300 acres. The tendency of the waves and currents has been to form a natural channel between the shore and the shoal, and this pointed out an artificial mode of securing a deep channel across the drift bar. By this means the water escaping seaward has been confined within the narrow channel, thus causing it to pass across the bar with increased velocity. The axial line of this work first set out conformed to the outline of the shore, and guided the current. The level of this work is 8ft. above mean low water, so that the ocean

swell at high water can pass over the work, and bring with it a quantity of sand, which lodges against the wall on the inside, and increases its stability. The construction shown by the author consists of close sheet piling in two thicknesses of 6in. and 4in. breaking joints, the greater thickness being on the sea side. On each side waling pieces were bolted through, about 12in. by 12in. and 8in. by 8in. strutted inside. A single thickness of piling was found to be deficient in tightness, the water worked backwards and forwards with the change of tide, and deep holes were scoured out that threatened undermining. In the deeper water, where the work was more exposed to the waves, a still more solid kind of construction was adopted. This consisted of a double row of sheet piling, 12in. thick, about 10ft. apart, cross-braced between, and filled in solidly with boulders and broken stone, and covered at the top with deck planks. Its top level was 1ft. 6in. higher than the single work, and the piles were 28ft. long instead of 24ft. The timber used was Oregon fir, sawed. Some difficulty was experienced by the scour and undermining, and at intervals of 60ft. on both sides box cribs, 24ft. by 6ft. by 4ft., were sunk at right angles to the work, filled with loose sand, and on the top with sand bags. Bundles of brush, loaded with sand bags, were put down alongside the work, while at the free end on each side crib wings, 30ft. long, rising to high water, were planted to break the local currents. The sand gradually accumulated against the work, and it has now a bank of sand against it. The operations are next described minutely by the author, into which we cannot enter here, but the results are soon told. The work was begun in 1871, and there was then over the bar barely 1.5ft. at mean low water, and no defined channel. In December, 1875, as the result of the work there was a straight clearly-cut 6.5ft. channel, mean low water. A gain of 5ft. of water on the bar was thus made. According to a rule the tonnage capacities of harbours vary directly as the cubes of their bar depths; hence 5ft. increase has improved the capacity of Wilmington harbour 81 times its original value. This has been done by tidal currents only, acting on a hard drift bar. It was found that small eddies of from 2ft. to 8ft. diameter, and of great velocity, aided the scour by their augur-like action on the bottom. These small eddies produced a whirling motion, raising the sand, and they were found to increase the depth sometimes as much as 6in. to 8in. an hour, and finally run together and produce a smooth channel. The success of this work is ascribed to George H. Mendell (Major, Corps Engineers), under whom the work was executed.

A steamboat-pier is about to be thrown out into Strachar Bay at Creggan, in the West Highlands, for landing tourists. Plans have been prepared by Mr. Melville, of Dunoon.

At Carshalton, Surrey, on Thursday night, a resolution was carried by an overwhelming majority, at a meeting of ratepayers, instructing the inspectors to light the streets with paraffin oil instead of gas.

The parochial chapel of St. Peter, Pitton, Wilts, is about to be rebuilt under the instructions of Mr. Ewan Christian. The chancel was formerly separated from the nave by three small arches, but the unusual arrangement was obliterated thirty-five years since, when an incongruous addition of brick wall was added as a north transept, and the present chancel arch of lath and plaster thrown up. It is now proposed to remove these, and while preserving the original form and size of nave and chancel, to add an aisle to the north, and a vestry behind it. The walls and tower will be raised in height. The outlay will be about £1,500.

In pulling down the old parish church of Longstock, Wilts, the labourers have come upon a coffin formed of pieces of chalk, roughly hewn and cemented together.

New works of water supply are to be publicly inaugurated, on completion, at Lossiemouth, near Elgin, to-morrow (Saturday).

Mr. J. H. Shaw, of Wakefield, has been unanimously elected to the assistant-surveyorship of Walsall.

A new mission chapel, in connection with the United Methodist Free Churches, has just been opened in Chatham-road, Birkdale. The building has been designed by and executed under the superintendence of Messrs. Maxwell and Tuke, architects, Southport.

Building Intelligence.

BURNHAM, ESSEX.—The fine old parish church of St. Mary, upon which large sums have been expended in restoration during the past few years, has just been further improved. The floor of the altar has been raised and extended, and laid with Maw's encaustic tiles, with large slabs of white marble for the kneeling portion. A pair of handsomely carved late Gothic screens have been raised. In the nave the masonic columns and their arcades have been scraped and repaired, and a large portion of the walls have been coloured. These works have been carried out under the supervision of Mr. Charles Read, of Burnham. A new pulpit, designed and built by Mr. J. Forsyth, of Baker-street, W., has been erected as a memorial to a late churchwarden. It is hexagonal in form, of Caen stone, with panels of bronze-coloured marble from Earl Bradford's quarries. Three statuettes—our Saviour as the Good Shepherd, with St. Peter and St. Paul on either side—stand under canopies in front of the principal panels. The carvings of the centre canopy rise above the cornice, and develop into a large cluster of foliage, forming the support to the back board. A prayer desk and lectern, of oak with brass crestings, also form part of the memorial church furniture. The reopening services took place on Sunday week.

BURSLER.—The foundation stone of a new Methodist Sunday School was laid on Monday week at Burslem. The proposed edifice, which is designed for the accommodation of four hundred children, will be 12 yards in width by 19½ in length. The façade will be of red pressed brick, relieved by white brick pilasters dividing it into three bays, and surmounted by an ornamental pedimented cornice. The centre bay will contain a large two-light-window, and those on either side windows of single lights. The total cost of the building is estimated at £1,460. The designs have been prepared by Mr. James Watkin, of Burslem, and are being carried out by Mr. J. Bowden, of Burslem and Endon.

CANFORD parish church, Dorset, was reopened on the 2nd inst., after restoration effected under the direction of Mr. David Brandon. The west end of nave has been rebuilt, with the addition of porches to the north and south aisle doors; the old west door has not been reproduced. The chancel is fitted with elaborate carved oak stalls, executed by a Belgian firm for Mr. Buckley, of Wigmore-street, W. New pulpit and organ have yet to be supplied, as well as the nave benches, before the alterations can be pronounced complete.

CLACTON-ON-SEA.—A new Wesleyan chapel was opened at this rising Essex watering-place on Tuesday week. The site, at the junction of three roads and near the sea front, was given. The building seats 450 persons, and cost five guineas per sitting. The style adopted is Early English, the materials used being Kentish rag, with Bath stone dressings. The work has been carried out by Mr. Regis, of Great Clacton, from the designs of Mr. Bell, of London. The gasfittings are by Messrs. Reynolds and Co., of Clacton-on-Sea.

COLERNE.—The parish church of Colerne, Wilts, has recently been reopened after complete restoration, the cost of which (£5,000) has been almost entirely given by the High Sheriff of Wilts, R. Walmesley, Esq., J.P., and W. H. Poynder, Esq., J.P. The work has been carefully carried out under the superintendence of Messrs. Wilson, Wilcox, and Wilson, architects, Bath, by Mr. Bladwell, builder.

CORK.—A new opera-house was opened at Cork on Monday evening. The building has been erected from the design of Mr. C. J. Phipps by Mr. Terence O'Flynn, builder, of Cork, Mr. M. Clarke acting as clerk of works. The decoration has been executed by Mr. Edward Bell. The ceiling, pillars of proscenium, and box fronts have a ground tone of very light cream colour. The flat part of ceiling and the cove are painted in Romanesque ornament in gold and colours, while the raised ornamentation of the gallery and stage-box fronts is picked out in gold upon a ground colour of Wedgwood blue. The stage boxes are

flanked by two fluted columns, having Corinthian capitals gilded and picked out in colour. The walls are covered with a sage-green paper, having gold ornamentation on it, and the curtains to the private boxes and the drapery hangings are of crimson rep, with gold borders. Considerable care seems to have been taken to facilitate ingress and exit, and the sitting arrangements are as complete as possible. The following are the principal dimensions:—Curtain line to back wall of pit, 69ft.; curtain line to front of dress circle, 39ft.; width of the proscenium opening, 30ft.; depth curtain line to back wall of stage, 40ft.

EASTBROOK.—On Saturday afternoon the memorial stone of new day and Sunday schools, in connection with Eastbrook Wesleyan chapel, near Bradford, was laid. The design has been prepared in plain Gothic by Mr. L. Leadley. The building, two stories in height, has a frontage of 147ft. to Chapel-street, and consists of a chapel, 33ft. 6in. by 36ft. 6in., with a height of 15ft.; a Sunday school, 55ft. 6in. by 36ft. 6in., 17ft. in height; a day school and infant school, each 64ft. by 36ft. 6in.; a number of class-rooms in each of the departments, and playgrounds under the buildings. Accommodation will be found for about 500 children in the mixed and infant day schools, and more than this number in the Sunday school. The cost of the building is estimated at £5,000.

EAST MARKHAM.—A set of Board schools has just been completed at East Markham, near Tuxford. They accommodate 186 children, with a master's house detached. They are built of red bricks, with Ancaster stone dressings, and slate roofs. The roofs are open timbered; lavatories and cap-rooms are provided. The school has a frontage of 96ft., and is broken up with buttresses and dormer windows. The porches have lean-to roofs. A large bell turret forms an important feature in the design. They were designed and carried out by Messrs. Clarke and Son, architects, Nottingham. Mr. Theophilus Wilson was the contractor, and the cost is £1,622, exclusive of the site.

ELY CATHEDRAL.—The restoration of the central octagon tower of the Cathedral is progressing favourably. The southern façade is almost completed, and during the present week the scaffolding is being removed from this side, thus exhibiting the effect of the additions. The work is being carried out from the designs of Sir Gilbert Scott, R.A., by Mr. Thomas Wood, of Ely, under the supervision of the Cathedral surveyor and clerk of works, Mr. R. Reynolds Rowe, of Cambridge.

GLASGOW.—St. Mungo's Catholic Church, situate in Parson-street, Glasgow, was reopened on Sunday, after restoration under the superintendence of Mr. Goldie, architect. The church still wants the upper part of the tower and spire to complete the original design, but internally it has now been made one of the most highly decorated places of worship in the city. The whole of the sculpture for capitals and bosses has been beautifully executed upon the rude blocks which for many years have disfigured the church, and following this the decorator has been called in to ornament roof, walls, and arcades with symbolic devices and rich colour. A balustrade of polished marble and alabaster now crosses the chancel arch as a rood loft, having upon it a sculptured group, representing Christ crucified, with the Virgin and St. John at the foot of the Cross. The new altar and reredos are of carved oak, brightened and defined in outline by delicately applied gilding. In the centre is a lofty fêche, containing, under a canopy, a statue of the patron saint (Mungo); below is the throne for the exposition of the Blessed Sacrament, and beneath that the tabernacle; flanking are statues, beneath canopies, of SS. Peter and Paul, and SS. Andrew and Margaret. The altar itself has medallion busts, in low relief, of Christ, the Virgin Mary, and St. John, and detached from the reredos, but forming part of the whole, are statues of SS. Roch, Patrick, Joseph, and Thenev. All the statues are adorned with decorative painting and gilding, and were executed at Lille, France.

KELSALE.—The parish church of Kelsale, Suffolk, will be re-opened, after restoration, on the 19th of October. The old chancel and

vestry adjoining have been pulled down and rebuilt, the chancel itself having been extended several feet, and the south aisle extended eastward for a considerable distance. Two vestries are also provided on the north side of the chancel. The nave, porch, tower, and other portions of the building to the westward have not yet been touched, but some portions are in great need of restoration. Mr. R. Norman Shaw, of 29, Bloomsbury-square, London, is the architect, and Mr. H. Luff, of Ipswich, the builder. The total estimated cost of the restoration is 3,063*l.*

LINCOLN CATHEDRAL.—Some anxiety was caused recently by the discovery that the south-west tower of Lincoln Cathedral was somewhat out of the perpendicular, and that extensive fractures appeared in the walls. A careful investigation proved that although the foundations of the tower were secure, a considerable portion of the building, some 70 or 80 feet from the ground, was in a dangerous state. The towers of the cathedral were not all originally designed to be carried to their present height, and the points at which the additions were made in the 15th century are easily discernible. The south wall of the tower under notice is pierced with passages, and the turret, it has been ascertained, was actually built upon a rubble arch instead of a solid stone wall. This, in course of time, gave way, and a settlement resulted, causing a bulging of the outer walls and fractures in the masonry. The Dean and Chapter took prompt measures, and the safety of the tower is now assured. The extensive works in accomplishing the repairs are now approaching completion.

LOOE.—A new Guildhall at Looe was opened on Thursday week. The building stands on a site about 120 feet in length and 75 feet in width. It is in the Early Gothic style, and is entirely detached. The principal feature in front is the lofty tower, rising some 64 feet in height, and surmounted by a slated spire. The whole height to the point of the rod above the vane is about 90 feet. The walls are of local stone, and the dressings of the several doors, windows, chimney cappings, copings, and other portions are of hard Portland stone. All the roofs are covered with Delabole slate, and finished with red tile cresting. The buildings contain on the ground floor a drill hall 45 feet by 20 feet, armoury, harbour commissioner's office, police cells, and entrance lobbies. On the first floor are the large hall (the same size as the drill-hall), council-chamber, and other rooms. Nearly the whole of the windows are filled with stained glass. The contract for the erection of the building was taken by Mr. Samuel Honey, of West Looe; the stained glass windows were designed by Messrs. Fouracre and Watson, of Stonehouse; the Mayor's chair, of carved oak, and the shield over the entrance doorway, are the work of Mr. Harry Hems, of Exeter, and the building has been erected from the designs and under the superintendence of Mr. J. F. Gould, of the firm of Gould and Sons, architects, of Barnstaple.

NOLTON CHURCH, PEMBROKESHIRE.—This church, dedicated to St. Medog, and situated in a romantic glen on the shore of St. Bride's Bay, was reopened on the 13th inst. after restoration. With the exception of some small portions of the east wall of the chancel and the south wall of the porch, which it was found absolutely necessary to remove and rebuild, the old walls have been left standing. A new vestry has been built on the north side of the nave, the old north door being utilised as an entrance to it. Trefoil-headed single-light windows in the nave, and a similar two-light window in the chancel gable, with quatrefoil in the head, take the place of some comparatively modern ones. New slated roofs, of increased pitch, and of open timber-work, plastered between the rafters, have been provided over the chancel and nave. The ancient arched ribbed ceiling over the porch has been repaired and cleaned. The outside walls generally have been pointed, and the inside plastered. A new encaustic floor has been laid in the chancel. The chancel tiles, which are partly glazed in the sacrarium, came from Messrs. Webb's works at Worcester, and the remainder from Mr. T. Peake's, of Trusall, in Staffordshire. The present accommodation is

for 111 persons, 85 of whom are seated in the nave. Originally the number of seats was for only 74. The works have been carried out from the plans and under the direction of the architect, Mr. E. H. Lingen Barker, of London, Hereford, and Tenby, and by Messrs. Jones and Jenkins, of Haverfordwest.

PARRACOMBE.—The foundation stone of a new church was laid last week at Parracombe, near Lynton. The cost of the building will be about £3,000. The plans have been prepared by Mr. W. C. Oliver, of Barnstaple, and the contract has been entered into by Messrs. Beavan and Sons. The church will comprise a nave and north aisle, each 42 feet 6 inches long, the former being 18 feet wide and the latter 12 feet; a tower at the west end, a chancel 24 feet by 15 feet, and a large vestry. The height of the tower to the top of the pinnacles will be about 63 feet, but it is hoped the contractors will be enabled to add another stage to contain the clock-chamber. The inside of the tower is to be of native dressed stone, pointed, and the other portions will be finished in tinted stucco. The chancel roof is to be boarded, and the nave and aisle roofs plastered between the rafters. The roofs are to be felted and covered with slate from the Whitland Abbey quarry. All the external dressings of the windows, copings, doorways, &c., are to be of Ham Hill stone, and all the internal wrought work, including the arcade, chancel arch, window jambs, sills, and strings, are to be of Bath stone. The style selected is Early Decorated, and the building is planned to seat 190 people.

PONDER'S END.—The memorial stone of the new district church of St. Matthew was laid here, on Monday last, 17th inst., by James Meyer, Esq., of Forty Hall, Enfield. The present contract comprises the nave and north aisle only, with accommodation for 304 adults and 38 children; a portion of the east end of the nave being appropriated for a temporary chancel. The complete design includes a nave of five bays, with clerestory and north and south aisles, a north porch, a tower 20ft. square, and spire 140ft. high, a south transept, apsidal chancel, and two vestries; the total ultimate accommodation being for 530 adults and 60 children. The present outlay is under £4,000, inclusive of all expenses except the site, which is a free gift. The walls are of rubble stone, faced externally with Kentish rag in random work; the dressings are of Bath stone, and the roof will be slated. The style adopted is 13th century English Gothic. The architect is Mr. H. J. Paull, F.R.I.B.A., of No. 9, Montague-street, Russell-square, and Manchester. The contractors are Messrs. Higgs and Hill, of Lambeth, and the clerk of works is Mr. H. Crocker.

SHEFFIELD.—The hospital for women, fronting Gell and Victoria-streets, commenced two years since, is rapidly approaching completion. It has been erected by Mr. Thomas Jessop, and when fitted will have cost between £25,000 and £30,000. The Elizabethan style has been strictly adhered to by the architect, Mr. Webster, of Sheffield, the chief features of the main frontage (in Leavygreave-road) being the bay and oriel windows, with elaborate carvings in the corbelling. No expense has been spared in the erection of the building, and it is carefully fitted for every necessary requirement. The governor's room, the board-room, the dispensary, and waiting-room are arranged on the ground floor; the first, second, and third stories are planned as wards. The warming and ventilating arrangements have been put into the hands of Mr. Phipson, of London. The hospital covers an area of 2,000 square yards. Messrs. Chambers and Son, of Commercial-street, are the contractors; Mr. Corrie, of Carver-street, is the plumber; and Mr. Kenyon, Ellesmere-road, Sheffield, the slater.

THE CHURCH OF THE HOLY TRINITY, ESCLUSHAM, NEAR WREXHAM.—This church, situate about 1½ miles from Wrexham, was opened for divine service on the 12th inst., by the Bishop of St. Asaph. The building consists of nave, chancel, north and south transepts, organ-chamber, and vestry, with heating apparatus under the latter. Accommodation is provided for 350 worshippers. The walls and masonry generally are of local stone, the

interior face being rough-stuccoed. The paved floors in nave, transepts, vestry, and organ chamber are of blue and red Staffordshire tiles. The chancel is laid with Messrs. Maw and Co.'s encaustic tiles. The roof is open, of Baltic fir, stained, and covered with red and green slates. The pulpit and font are of Bath stone. The style of the building is Early Geometrical. The future extension of the church will be effected by adding large north and south aisles, for which special provision has been made. The building is heated with hot water by Messrs. Jones and Sons, of Bankside, London; and the reading desk, lectern, and other articles of furniture were supplied by Messrs. Jones and Willis, of Birmingham. The general contractors were Messrs. Phennah and Davies, of Rhosyllen, whose contract was £2,541. Mr. J. E. Lash, of Wrexham, was the architect.

UMBERSLADE.—On Tuesday a new Baptist chapel was opened at Umberslade, near Knowle. The building is Geometrical Gothic in style, built of grey Wilnecote stone, with Bath stone dressings, carved. The church comprises a nave, seated for 200 worshippers, and an octagonal apse, in which is placed the pulpit and baptistery; also two small vestries, separated by a screen. The baptistery, in white marble, is open to the church, and is placed at the front of the pulpit. Shallow transepts give effect to the external design, and in one the organ is placed. The tower is 52ft., and is surmounted by the spire, which reaches an elevation of 110ft. The whole has been built from the designs and under the superintendence of Mr. George Ingall, architect, Birmingham, by Messrs. Smallwood and Co., builders, of Wootton Wawen.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published September 21 contains articles on Preventive Medicine in Relation to Public Health, Australian Health Statistics, Domestic Sanitary Construction, Adulterations of Food Detected, The Causes of Disease in Country Homes, Local Mortality Statistics in London, A Peculiar Case of Lead Poisoning, School Drill, The Weather and Bodily Pain, Public Health Reports, Legal Intelligence, Water Supply and Sanitary Matters, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c. Price 2s. Annual Subscription, post-free, eleven shillings. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

G. M. BUTTS. (No.)—WEST INDIES. (You will have to order such works from abroad, or through a London bookseller.)—W. A. GILDER. (You had better get from the Society of Arts the summaries of this and last year's "Health and Sewage of Towns Conference." See also indices to the last two volumes of *Public Health*.)

THE MECHANICS OF SHORING.—There are two errors made by the printer in this article, which appeared last week. 1. Line 11, in 3rd column, p. 249, "walling-piece" should have been printed "walling-piece," only one l, and the a pronounced long, as in walling. 2. Half-way down 2nd column, p. 250, the formula for F should be—

$$F = P \sin. \theta + Q \cdot \cos. \theta \\ = 43 \times .98056 + 9 \times 1.6223$$

(The error consisted in the sign of multiplication being substituted for that of addition.)

Correspondence.

THE OLD HOUSE AT RYE.

To the Editor of the BUILDING NEWS.

SIR,—I went down to Rye, in Sussex, last week, intending to make measured drawings of the well-known half-timbered house in Mermaid-street. The house has been empty for some years, and was so when I made a hurried visit there in the spring, and thus I had still hoped to find it. However, to my dismay, on my last visit I discovered workpeople in possession, converting it into a pair of modern residences. That part of the building which was, to my mind, the more interesting—viz., the inside—is completely changed, and, with the exception of the front of the house, the building has now lost all its character.

My object in writing is to ask some one of those who have carefully measured this building—and I believe many have—to offer their drawings for publication in your journal, and thus, since the opportunity for study is gone, allow others to share in that which was so full of interest and instruction.

Among other details till recently remaining—and of the second period of this house—there is one of an Early sash window. In a communication made to you some time ago, when the question of Gothic principles was being discussed in these columns, I mentioned that if sash windows had been used by the Mediaevalists they would certainly have exposed the weights by which the sashes were hung, and in the present example this has been done. The pockets for the weights—the bottom sash only being hung—were formed by deep grooves cut in the face of the stout posts of the window-frame on the side towards the room, and not apparently in any way concealed; and no doubt the weights themselves were formed in such a manner as to be interesting and good to look at, and the lines possibly made of twisted gut, or some other durable material. The sash pulleys are in hard wood.

I think the origin of these hung sash windows is clearly traceable to the old two-light sliding sash window, one light of which was always fixed. If such a sash frame and sashes were put on end it would be almost identical with the early type of a hung sash window, the outside bead being worked on the frame out of the solid, and, if the sash were not hung, kept up when open by the sort of hinged slip still seen in many old sash windows of later times.

During the Mediaeval period window glass was apparently more precious abroad than with us, for, although here the window-frames and shutters to them were often made as if to remove, and considered as tenants' fixtures, yet abroad this principle seems to have been observed even more generally, for the glass itself, instead of being worked into lead lights, was often in small buildings—where the chances of removal were greater—fixed with little projecting sprigs into wooden bars forming small squares, and thus the glass could easily be taken out and put away when not wanted, and also the frames and everything removed at any time with less liability of damage.

A marked feature in houses of this period—i.e., of the fifteenth and sixteenth centuries—is the great similarity existing in the joinery, panelling, and so forth, and noticeable in all parts of the country. There is an illustration of it in the earlier work in this house. The wainscoting being sometimes removed like the window-frames is only a partial explanation, and it is difficult to explain the rest. Sir Digby Wyatt, speaking some years ago on this question, said, "We know that the difficulties of locomotion were very great, and that such poor means as then existed for the transmission and intercommunication of ideas were constantly more or less suspended or interrupted by the exigencies of war, and other innumerable accidental causes. Yet that there existed a sort of electric current which ran during the middle ages through the minds of all practising art over the whole continent of Europe, we cannot fail to discern and admit. Thus, in architecture, the moment a real important structural change took place in our country, its echo

seemed to make itself audible in some other in an incredibly short space of time. In a similar way, from province to province, and almost from village to village, the movement seemed to be propagated."

It would be interesting if more light could be thrown on this subject, and that at no distant day, for, as we see, the opportunities for obtaining it are gradually lessening.—I am, &c.,
R. MORRISON MARNOCK.
32, Southampton-street, Strand, Sept. 17.

DESIGNS FOR LIBRARY BUILDINGS.

SIR,—There will be held on October 2, 3, 4, and 5, a Conference of Librarians in the theatre of the London Institution, and during those days there will be in the adjoining large library an exhibition of all kinds of library appliances and designs. In evidence of the important and influential character of the conference it is enough to say that the principal librarian of the British Museum will be nominated for its president, and will deliver an inaugural address, and that many librarians from other countries, including a large delegation from the United States, will come to England for the purpose of attending it.

The organising committee will gladly give room to any designs for library buildings which may be sent here. They cannot undertake to repack and return exhibits of any kind, but everything will be kept with care, and may be sent for on or after October 6. Will you allow me to add that, while librarians do not yield to other people in their appreciation of architectural beauty, they set a still higher value on the provision of as much shelf-room, as much reading space, and as much light as possible, and the designs which best satisfy these conditions will undoubtedly attract the most notice.—I am, &c.,

EDWARD B. NICHOLSON,
Secretary of the Organising Committee.
London Institution, Finsbury-circus, E.C.,
September 17.

THE RULE OF ST. BENEDICT.

SIR,—I observe that a difficulty has been felt in an expression which occurs in the charter of Kymmer Abbey, as though it were strange that Cistercians should live under the rule of St. Benedict. They adopted it in its most rigorous form. Allow me to explain that there are three rules recognised by Jus Commune, to one of which the religious must conform—those of St. Benedict, St. Basil, and St. Augustine. The first in the West, the second in the East, is observed by monks, and the third by canons regular. [See *Lyndwood, Lib. III., tit. 20, p. 213.*]

The substantials—that is, the three vows—were common to all monks and regular canons. In their habit or dress, to the inexperienced eye, all monks were much alike, except in variation of colour, the Benedictine and Cluniac wearing black, and the Cistercian undyed woollen. Canons regular adopted shoes [sotulares], monks wore boots [ocrea]. Friars and the military orders were under the Augustine rule. There was an old saw . . . nigræ vestis nec nota rotunda non faciunt monachum. . . . [*Jo. de Athon. App. Lyndw., Prov. p. 146.*]
—I am, &c., MACKENZIE E. C. WALCOTT.

FORCE OF WIND.

SIR,—The "Author of the Article" on the above subject appears to think that he defends the formula he used in calculating his table of the force of wind on inclined surfaces, by calling attention to an apparent irregularity in Prof. Unwin's table. That gentleman is, I have no doubt, well able to defend his work, and I should say, is much too good a mathematician to have adopted the table without noticing the apparent anomaly referred to.

The formula used by the "Author of the Article" was pointed out by Mr. Froude to be erroneous in the case of fluids (see Vol. XXXII. Proc. Inst. C.E., p. 233), and the Aeronautical Society had some experiments made in 1872, which, as regards air, further proved the erroneousness of this formula, which is now adopted by the writer of the article in question.—I am, &c., J. S.

PRESSURE OF WIND ON OBLIQUE SURFACES.

SIR,—My attention has been called to a letter in your issue of September 14, in which Hutton's formula for the pressure of wind on oblique surfaces is called in question. Your correspondent says:—"The formula, however, as worked out by Mr. Unwin, contradicts itself, for on the supposition that the wind blows horizontally against a roof, it gives the normal pressure per foot on a roof of 60° pitch as the same as that on a perpendicular wall, against which, of course, the wind would have its maximum effect. And, what is still more extraordinary, when the pitch is 70° the normal pressure per foot is actually greater than that on a vertical wall—that is, greater than the maximum." Now, sir, I do not know on what grounds your correspondent assumes that the normal pressure on a surface freely exposed all round to an unlimited current would be greatest when the surface was perpendicular to the direction of the current. The action is so complex that I should myself hesitate to predict in what position of the surface the normal pressure would be greatest. I therefore feel obliged to have recourse to the results of experiments to determine the point, and, so far as I know, they entirely agree with Hutton's formula.

A few years ago some experiments were made by the Aeronautical Society on the pressure of a current of air from a large foundry fan on a small plane surface opposed to it at various angles. The apparatus used for measuring the pressure was very delicate, and was so contrived as to register separately the two components of the normal pressure, one parallel the other at right angles to the current. Combining these two components we get the resultant normal pressure on the surface. The results are given in the following short table. The fan was run at a constant speed, giving a constant volume and velocity of air, and the results of several trials gave the following resultant pressures on a plate exactly 1ft. square:—

	Normal pressure in lbs. on the plate.
Plate perpendicular to current	3.24
Plate making angle of 60° with current	3.45
Plate making angle of 45°	3.40
Plate making angle of 20°	1.90
Plate making angle of 15°	1.55

I have quoted these results because they are quite independent of Hutton's; they were made on a larger scale, and the plate during the experiment was fixed, while the air was in motion. They give results not widely different from those obtained from Hutton's formula, but they make the pressure on the inclined surface more markedly greater than that on the perpendicular surface than is the case in Hutton's experiments. For many reasons it is doubtful how far Hutton's formula is applicable in determining the pressure on such a surface as a roof, but it appears to me that we have no reason to discard it because it makes the normal pressure on a moderately-inclined surface greater than on a surface perpendicular to the wind.—I am, &c.,
W. CAWTHORNE UNWIN.

STUCK ON.

SIR,—If any of your readers wish to pick up a useful idea about competitions, let them inspect the drawings for the North London Consumption Hospital, on view at the hospital in Tottenham Court-road. They will find that one competitor has commenced his report by giving his address, and they may wonder that he thought it worth while, after that, to use any motto. However, the motto is there—"Stuck on," the meaning of which is explained on holding it up to the light, for, behold! his signature is there also.—I am, &c., W. M.

Messrs. Reid and Co.'s brewery, extending as it does from Gray's Inn-road, on the west, to within a few yards of Farringdon-road to the east, is now drawing near its completion. It is said the machinery, vats, and general plant is on a scale of the greatest magnitude. The builders are Messrs. W. Cubitt and Co., Gray's Inn-road, and the whole of the telegraphic arrangements have been placed in the hands of the eminent telegraph engineers, Messrs. Francis and Co., of Hatton-garden.

Intercommunication.

QUESTIONS.

[5126].—Chemical Test for Impurities from Wells.—Will some of the contributors to "Intercommunication" kindly give me a chemical test for impurities in water from wells—such impurities as filter from cesspools, &c.—CESAR.

[5127].—Flooring.—Will any correspondent give me his opinion as to the merits of flooring matched—i.e., one board having a wooden tongue, and the other grooved—over the old plan of both boards being grooved for and having iron tongues? Which makes the best job?—ENQUIREE.

[5128].—Winchester and St. Alban's.—Will one of your correspondents kindly give me the exact internal dimensions of Winchester and St. Alban's? I saw them given anew in some paper very lately.—MACKENZIE E. C. WALCOTT.

[5129].—Grey Granite in North Germany.—Will some reader inform me in what part of Prussian Poland or North Germany the grey granite quarries are situated? I have been informed the granite is extensively used in Berlin and other large cities in the country. Also, who publishes the best guide and handbook with map of the district?—ANGLO-SAXON.

[5130].—Breaking Weight of Trussed Girder.—Will some one kindly give me a simple rule for calculating the breaking weight of a trussed girder of this design 40ft. long, by 3ft. 8in. high, and rule

for calculating the weight or strain at the points marked A and B? Also, for the strain on top piece between A and B.—REY.

[5131].—Fire-proof Liquid or Paint.—I am desirous of rendering the boarding along some passages in an old mansion proof against fire by means of covering it with a liquid or paint. Can any of your readers kindly inform me how to do this?—TOR.

[5132].—Compensation for Deficient Quantities.—Will any reader kindly say if a builder can obtain compensation from a quantity surveyor for errors in bills of quantities supplied, if after the works are executed the builder finds the works exceed the quantities supplied, and upon which he has based his estimate. Has such a case ever been tried in the higher courts? If so, please quote the case, or has the builder any remedy against the employer?—A BUILDER.

[5133].—Rolled and Built Girders.—Is there any difference in the formula for computing the strength of a rolled girder from that used in ascertaining the strength of a built-up girder; if so, will some one kindly state it, and oblige—A YOUNG SURVEYOR.

[5134].—Charge for Taking out Quantities.—I wish to know what is the usual charge for taking out quantities of a house, &c., and preparing a draft bill for the architect to place in the hands of the lithographer? Will some more experienced surveyor inform me?—A YOUNG SURVEYOR.

REPLIES.

[5110].—Separating Fine Sand from Water.—I think if "X. Y. Z." had fully carried out the plan I recommended in my last, he would have found it to answer, for this reason:—Water, if it flows at a less rate than 12ft. per minute, will not carry sand along with it. As the quantity of water to be dealt with is only a little over 40 gallons per minute, a cistern 12ft. long, with the bottom of the outlet 9 or 12in. above the bottom of the inlet, should so reduce the velocity of the stream that it would be impossible for the sand to travel farther

than the cistern. I send a section of cistern, showing inlet and outlet, and supposed bed of channel. Let the dotted line represent the bed of channel, A the inlet, B the outlet. C D will be the surface of the water. In the centre is shown the cistern. To stop the sand, "X. Y. Z." must be careful to make the outlet above the inlet, or it will not answer.—AQUA.

[5120].—Joiner Work.—The idea of "Veneering" would not be economical. If the ornament were cut out of the veneer as suggested and let in flush with face of lighter wood, it would be equivalent to make the cheaper wood the most precious, and therefore the decoration would be untruthful. It would be like covering a precious stone with gold and only showing a small portion of it. Besides

which the labour of sinking the lighter material would be great.—G. H. G.

[5121.]—Purification of Sewage.—I am not aware that the Local Government Board have approved of any precipitation scheme. They only sanction precipitation under certain conditions, or when it can be combined with irrigation.—SURVEYOR.

[5124.]—Strength of Arch.—“C. E. E.” had better not trust to a tile arch of the span and flatness he proposes, without an iron tie-rod on each side of the furnace. If he can insert stone flags into the side wall so as to form a corbelling it would greatly help, and allow of a considerable weight.—G. H. G.

[5125.]—Flitch Girder.—If the side timbers are each 13 × 6, with an iron flitch, say, $\frac{3}{4}$ in. thick, the weight will be adequately borne.—ARCHITECTUS.

CRIPS.

The members and association of the Society of Engineers visited the works of the Great Eastern Railway Company at Stratford on Wednesday week, on the invitation of Mr. Adams, locomotive superintendent of the company.

Mr. Jonas Turvey, a working man, was elected surveyor to the Romford Local Board of Health on Monday last, at a special meeting, out of a considerable number of applicants.

The Barnacre Shooting Box, illustrated by us last week, is, we are informed, not heated by steam coils throughout, but by hot water, pipes and coils, fixed by the Cowan Patents Company.

An inquiry was held at Loftus, on Thursday week, before Mr. Arnold Taylor, one of the inspectors of the Local Government Board, respecting an application from the Local Board of Health for sanction to borrow £450 for widening the bridge and approaches. The inspector complained that the Local Government Board had not received a tracing of the proposed alteration, and requested the surveyor (Mr. Stainthorpe) to forward one.

Plans have been prepared for the Cambridge guardians by Mr. Bays, their architect, for additional receiving and tramp wards, to be placed on either side of the entrance to the Cambridge Union-house. The following tradesmen's tenders have been accepted for work to be done during the ensuing half-year: Carpentering, Mr. Reeve; bricklaying, Mr. G. Barbage; plumbing, Mr. Scales; and whitewashing, Mr. Munns.

The Local Board of Driffield have requested Mr. Banks, borough surveyor of Kendal, to examine into and report upon the scheme for the drainage of the town prepared for the board by Messrs. Oldham and Bohnhill, recently their engineers. Mr. J. S. Latus, of Driffield, has been elected inspector of nuisances and buildings to the board at a salary of £50 per annum.

The local authority of the hamlet of Brentwood last week voted an addition of £25 a year to the salary of Mr. Shelley, inspector of nuisances to the rural sanitary authority of Billericay, Essex.

The inner harbour at Arbroath, originally constructed in 1725, has been rebuilt and converted into a floating basin. The area of the dock thus formed is $2\frac{1}{2}$ acres; space, 1,313ft.; depth of water, 13ft. at neap and 17ft. at spring tides. The cost has been £40,000. The gates were closed, without a public ceremony, on Thursday, on the completion of the work.

Roan's Charity School for Boys, Greenwich, is nearly completed, and will be opened on the 1st prox. Mr. Walker is the architect.

The grand old church of Holy Trinity, Hull, now under restoration, narrowly escaped destruction on Sunday week. A fire broke out in premises near by, causing great destruction of property, and communicated to the scaffolding around the tower and to the belfry louvres and roof beneath, the lead of which was melted.

The Rev. Wm. Kingsley, the rector of South Kilvington, near Thirsk, has, at his own expense, just completed the improvement of the old parish church by re-stalling the chancel, building a new organ, containing 20 stops, and putting in heating apparatus, and new north window in chancel.

Chipping Norton parish church is about to be re-seated and otherwise restored.

The Cardiff guardians opened tenders on Saturday for the building of a dormitory and storehouse at the workhouse, and, after a discussion, decided by 10 votes to 5 to accept the tender of Messrs. Jones Brothers, amounting to £1,075, although another contractor offered to do the work for £102 less.

The Lancashire magistrates, at their meeting in Quarter Sessions on Thursday week, received a report from a committee on the county provision for the care of lunatics, recommending that “annexes capable of holding not less than 500 or 600 patients of the chronic class, of plain and simple design, with associated dormitories,” be added to the asylums at Laneraset, Prestwich, and Whittingham, and that a building of similar character be erected at Rainhill, if land can be obtained for the purpose on fair terms. The report was adopted, and the committee were authorised to take steps to carry it into effect.

Our Office Table.

THE new dock at Leith, which was commenced in 1873 from plans by Messrs. Rendel and Robertson, is being steadily proceeded with. The space of ground enclosed by the breakwater is about 120 acres, the water space of the dock is $16\frac{1}{2}$ acres, and some idea of the immense amount of material used may be formed from the fact that the stone-pitching on face amounts to 120,000 cubic feet; facework dressed for dock, 80,000 cubic feet; concrete pitching on face, 15,000 cubic yards; rubble heaving in embankment, 90,000 cubic yards; clay puddle, 30,000 cubic yards; banking behind wall, 100,000 yards. These quantities expressed in weight amount to about 400,000 tons, or about 550 tons per day since the commencement of the work. The sons and nephew of the late Mr. William Scott, who took the contract, are carrying out the work.

THE *Financial Chronicle* refers to a system which has been found successful in France by which it is proposed to indemnify architects against any loss to which they may be subjected under contracts with their clients. By the French Code architects and contractors are held responsible, for a period of ten years after the completion of structures, for the total or partial loss in buildings constructed by them, if such loss is caused by a fault either in the building or the foundation. It is evident that such a law cannot but have a good effect, as it offers a guarantee for the efficiency of the building in all its parts, and a safeguard to the public against accidents to life. But, on the other hand, it has often proved disastrous to architects and contractors, and large sums of money have been lost by them from the class of accidents mentioned. *L'Argus* is of opinion that data to found upon in carrying out such a system of insurance could easily be had; and, considering the very great responsibilities of this class of men—the sum insured on a single building amounts often to half a million or a million of francs—it is believed that every member of the profession would readily take advantage of this form of insurance. The question of the professional honesty of the architect or contractor remaining at its present high worth under the operation of such a ready means of indemnification against loss is considered, and decided, we think justly, in favour of the architect, who would still have a reputation to gain or to preserve, and for the sake of that reputation would continue, as now, to put honest work and good material into the building, and to render it as lasting as possible.
